ENCYCLOPÆDIA BRITANNICA;

DICTIONARY

ARTS, SCIENCES,

MISCELLANEOUS LITERATURE;

Constructed on a PLAN,

BY WHICH

THE DIFFERENT SCIENCES AND ARTS

Are digested into the Form of Diffinct

TREATISES OR SYSTEMS,

COMPREHENDING

The HISTORY, THEORY, and PRACTICE, of each, according to the Latest Discoveries and Improvements;

AND FULL EXPLANATIONS GIVEN OF THE

VARIOUS DETACHED PARTS OF KNOWLEDGE,

WHETHER RELATING TO

NATURAL and ARTIFICIAL Objects, or to Matters Ecclesiastical, Civil, Military, Commercial, &c.

Including Elucidations of the most important Topics relative to Religion, Morals, Manners, and the Oeconomy of Life:

TOGETHER WITH

A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, &c. throughout the WORLD;

A General HISTORY, Ancient and Modern, of the different Empires, Kingdoms, and States;

An Account of the Lives of the most Eminent Persons in every Nation, from the earliest ages down to the present times.

Compiled from the writings of the hoff Author, in foured languages; the moft approved Dillimaries, as well of general filence as of its partiabor branches; the Tringulation, Farmals, and Memirs, of learned Societies, both at base and about it the MS. Leitures of Emirant Profigies on different filences; and a variety of Frighal Materials, familied by a Extensive Germphosico.

THE THIRD EDITION, IN EIGHTEEN VOLUMES, GREATLY IMPROVED.

ILLUSTRATED WITH FIVE HUNDRED AND FORTY-TWO COPPERPLATES.

VOL. IX.

INDOCTI DISCANT, ET AMENT MEMINISSE PERITI.

E D I N B U R G H.
PRINTED FOR A. BELL AND C. MACFARQUHAR,
MDCCXCVII.

Entered in Stationers ball in Terms of the Aft of Parliament.

ENCYCLOPÆDIA BRITANNICA.

SCIENCE which treats of the weight, motion, and equilibria of liquid bodies. Under this had, not only accounts of the nature and properties of fluids in general are introduced, and the laws by which they act; but also the art of weighing folid bodies in fluids, in order to discover their specific gravities.

SECT. I. Of FLUIDS in general.

Sir Isaac Newton's definition of a fluid is. That it is a body yielding to any force impressed, and which hath its parts very eafily moved one among another. See FLUIDITY.

Fluid de-

fined. &c.

This definition supposes the motion spoken of produced by a partial preffure; for in the case of an incompressible sluid, it is demonstrated by Dr Keil, that under a total or an equal pressure, it would be imposfible that the yielding body should move.

The original and constituent parts of fluids are by the moderns conceived to be particles small, smooth, hard, and fpherical: according to which opinion, every particle is of itself a solid or a fixed body; and, when confidered fingly, is no fluid, but becomes fo only by being joined with other particles of the same kind. From this definition, it hath been concluded by fome philosophers, that some substances, such as mercury, are effentially fluid, on account of the particular configuration of their particles; but later difcoveries have evinced the fallacy of this opinion, and that fluidity is truly to be reckoned an effect of heat.

That fluids have vacuities, will appear upon mixing falt with water, a cercain quantity whereof will be diffolved, and thereby imbibed, without enlarging the dimensions. A fluid's becoming more buoyant, is a certain proof that its specific gravity is increased, and of confequence that many of its vacuities are thereby filled: after which it may still receive a certain quantity of other disfoluble bodies, the particles whereof are adapted to the vacancies remaining, without adding any thing to its bulk, though the absolute weight of the whole fluid be thereby increased.

This might be demonstrated, by weighing a phial of rain-water critically, with a nice balance: pour this water into a cup, and add falt to it; refund of the clear liquor what will again fill the phial; an increase of weight will be found under the same dimenfions, from a repletion, as has been faid, of the vacuities of the fresh water with faline particles.

Vol. IX. Part I,

And as fluids have vacuities, or are not perfectly denfe; it is also probable, that they are compounded of small spheres of different diameters, whose interflices may be fucceffively filled with apt materials for that purpose: and the smaller these interstices are, the greater will the gravity of the fluid always be.

For instance, suppose a barrel be filled with bullets in the most compact manner, a great many fmall shot may afterwards be placed in the interffices of those balls, the vacuities of the shot may then be replenished with a certain quantity of fea-fand; the interffices of the grains of the fand may again be filled with water; and thus may the weight of the barrel be greatly augmented, without increasing the general bulk.

Now this being true with regard to folids, is applicable also to sluids. For instance, river-water will perties. disfolve a certain quantity of falt; after which it will receive a certain quantity of fugar; and after that, a certain quantity of alum, and perhaps other diffoluble bodies, and not increase its first dimensions.

The more perfect a fluid is, the more eafily will it yield to all impressions, and the more easily will the parts unite and coalesce when separated. A perfect fluid is that whose parts are put into motion by the least force imaginable: an imperfect one is that whose parts yield to a small force, not the least. It is probable, that in nature there is no perfect fluid, the element of fire perhaps excepted; fince we fee that the mutual attraction of the parts of all the fluids, fubiect to our experiments, renders them cohefive in some degree; and the more they cling together, the less per-fect their fluidity is. If, for instance, a glass be filled with water above the brim, it will visibly rife to a convex furface, which, was it a perfect fluid, free from either tenacity or cohesion, would be impossible.

Mercury, the most perfect fluid we know, is not exempt from this attraction; for should the bottom of a flat glass, having a gentle rising toward the middle, be covered thin with quickfilver, a little motion of the machine will cause the fluid foon to separate from the middle, and lie round it like a ring, having edges of a confiderable thickness.

But if a like quantity thereof be poured into a golden cup, it will, on the contrary, appear higher confiderably on the fides than in the middle. Which may proceed in part, perhaps, from the gold's being of great dentity, and therefore capable of exerting thereon a greater degree of attraction than other metals. Probably too it may happen from its having pores of

Pressure of an apter disposition and magnitude to receive the mi-Fluids. nute mercurial particles, than those of iron and some other metals; and therefore the attraction of cohesion in this experiment may obtain also: and every one knows how easily these two bodies incorporate, and

make a perfect amalgama. But the reason commonly given for the two phenomena is, that mercury, in the first case, attracts itself more than it does glass; and, in the last case, mercury attracts gold more than it

Sir Ifaac Newton held all matter to be originally homogeneous; and that from the different modifications and texture of it alone, all bodies receive their various structure, composition, and form. In his definition of a fluid, he feems to imply, that he thought fluids to be composed of primary folids; and, in the beginning of his Principia, he speaks of fand and powders as of imperfect fluids.

Borelli has demonstrated, that the constituent parts of fluids are not fluid, but confiftent bodies; and that the elements of all bodies are perfectly firm and hard. Florentine The incompressibility of water, proved by the Floexperiment, rentine experiment, is a fufficient evidence also, that each primary particle or fpherule thereof is a perfect

and impenetrable folid. Mr Locke too, in his Effay on Human Understanding, admits this to be fo. This famous experiment was first attempted by the

great lord Verulam, who inclosed a quantity of water in lead, and found that it inclined rather to make its way through the pores of the metal, than be reduced into less compass by any force that could be applied. The academics of Florence made this experiment afterwards more accurately with a globe of filver, as being a metal lefs yielding and ductile than gold. This being filled with water, and well closed, they found, by hammering gently thereon, that the fphericity of the globe was altered to a less capacious figure (as might geometrically be proved); but a part of the water always like dew came through its fides before this could be obtained. This has been attempted by Sir Isaac Newton, and so many competent judges, on gold and feveral other metals fince, with equal fuccels, that we do not hold any fluid in its natural state, except the air, to be either compressible or elastic .-In fome experiments by Mr Canton, it hath been obferved, that water is more or less compressed according to the different conflitution of the atmosphere; whence it hath been concluded that the Florentine experiment was erroneous; but it will not follow, that water can be compressed by any artificial force, because nature hath a method of compressing it; any more than that folid metal can be compressed artificially, though we know that very flight degrees of heat and cold will expand or contract its dimensions. See WATER.

SECT. II. Of the Gravity and Pressure of Fluids.

Fluids prefs ALL bodies, both fluid and folid, prefs downwards as much by the force of gravity: but fluids have this wonder-Woward as ful property, that their pressure upwards and sidewise downward, is equal to their preffure downwards; and this is always in proportion to their perpendicular height, without any regard to their quantity: for, as each particle is quite free to move, it will move towards that

part or fide in which the pressure is least. And hence, Pressure of no particle or quantity of a fluid can be at rest till it is Fluids. every way equally preffed.

To show by experiment that fluids press upward as Plate well as downward, let A B be a long upright tube ccxxxix. filled with water near to its top; and CD a fmall tube open at both ends, and immerfed into the water in the large one: if the immersion be quick, you will see the water rife in the fmall tube to the fame height that it stands in the great one, or until the furfaces of the water in both are on the fame level: which shows that the water is pressed upward into the small tube by the weight of what is in the great one; otherwife it could never rife therein, contrary to its natural gravity, unless the diameter of the bore were fo fmall, that the attraction of the tube would raife the water; which will never happen, if the tube be as wide as that in a common barometer. And, as the water rifes no higher in the fmall tube than till its furface be on a level with the furface of the water in the great one, this shows that the pressure is not in proportion to the quantity of water in the great tube. but in proportion to its perpendicular height therein : for there is much more water in the great tube all around the small one, than what is raised to the same height in the small one as it stands in the great.

Take out the fmall tube, and let the water run out of it; then it will be filled with air. Stop its upper end with the cork C, and it will be full of air all below the cork: this done, plunge it again to the bottom of the water in the great tube, and you will fee the water rife up in it to the height E. Which shows that the air is a body, otherwise it could not hinder the water from rifing up to the same height as it did before, namely, to A; and in fo doing, it drove the air out at the top; but now the air is confined by the cork C: And it also shows that the air is a compressible body; for if it were not fo, a drop of

water could not enter into the tube.

The pressure of fluids being equal in all directions, it follows, that the fides of a veffel are as much preffed by a fluid in it, all around in any given ring of points, as the fluid below that ring is proffed by the weight of all that stands above it. Hence the pressure upon every point in the fides, immediately above the bottomis equal to the pressure upon every point of the bottom. -To show this by experiment, let a hole be made at e Fig. 3. in the fide of the tube AB close by the bottom, and another hole of the fame fize in the bottom at C; then pour your water into the tube, keeping it full as long as you choose the holes should run, and have two basons ready to receive the water that runs through the two holes, until you think there is enough in each bafon; and you will find by meafuring the quantities, that they are equal. Which shows that the water run with equal fpeed through both holes; which it could not have done, if it had not been equally preffed through them both. For, if a hole of the fame fize be made in the fide of the tube, as about for and if all three are permitted to run together, you will find that the quantity run through the hole at f is much less than what has run in the same time through either of the holes C or e.

In the same figure, let the tube be re-curved from the bottom at C into the shape DE, and the hole at

Sect. II.

Preffure of C be flopt with a cork. Then pour water into the Fluids. tube to any height, as Ag, and it will fpout up in a jet EFG, nearly as high as it is kept in the tube AB, by continuing to pour in as much there as runs through the hole E; which will be the case whilst the surface A g keeps at the same height. And if a little ball of cork G be laid upon the top of the jet, it will be supported thereby, and dance upon it. The reason why the jet rifes not quite fo high as the furface of the water Ag, is owing to the refistance it meets with in the open air: for if a tube, either great or fmall, was fcrewed upon the pipe at E, the water would rife in it until the furfaces of the water in both tubes were on the fame level; as will be shown by the next expe-

The hydro-

Plate

fig. 4.

Any quantity of a fluid, how small soever, may be flatic para- made to balance and support any quantity, how great foever. This is deservedly termed the hydrostatical paradox; which we shall first show by an experiment, and then account for it upon the principle above mentioned, namely, that the pressure of fluids is directly as the water. their perpendicular height, without any regard to their quantity.

Let a fmall glass tube DCG, open at both ends, and bended at B, be joined to the end of a great one AI at ed, where the great one is also open; so that these tubes in their openings may freely communicate with each other. Then pour water through a fmall necked funnel into the fmall tube at H; this water will run through the joining of the tubes at cd, and rife up into the great tube; and if you continue pouring until the furface of the water comes to any part, as A, in the great tube, and then leave off, you will fee that the furface of the water in the fmall tube will be just as high at D; fo that the perpendicular altitude of the water will be the fame in both tubes, however fmall the one be in proportion to the other. This fhows, that the small column DCG balances and supports the great column Acd; which it could not do if their pressures were not equal against one another in the recurved bottom at B .- If the fmall tube be made longer, and inclined in the fituation GEF, the furface of the water in it will ftand at F, on the fame level with the furface A in the great tube: that is, the water will have the fame perpendicular height in both tubes, although the column in the fmall tube is longer than that in the great one; the former being oblique, and the latter perpendicular. Since then the pressure of fluids is directly as their

perpendicular heights, without any regard to their quantities, it appears, that whatever the figure or fize of veffels be, if they are of equal heights, and if the areas of their bottoms are equal, the pressures of equal heights of water are equal upon the bottoms of thefe veffels; even though the one should hold a thousand or ten thousand times as much water as would fill the other. To confirm this part of the hydrostatical paradox by an experiment, let two veffels be prepared of equal heights, but very unequal contents, fuch as AB fig. 5. and AB in fig. 6. Let each vessel be open at both ends, and their bottoms D d, D d be of equal widths. Let a brafs bottom CC be exactly fitted to each veffel, not to go into it, but for it to ftand upon; and let a piece of wet leather be put between each

Join each bottom to its veffel by a hinge D, fo that Preffure of it may lie open like the lid of a box; and let each bor-tom be kept up to its veffel by equal weights E and E hung to lines which go over the pulleys F and F (whose blocks are fixed to the fides of the vessels at f), and the lines tied to hooks at d and d, fixed in brass bottoms opposite to the hinges D and D. Things being thus prepared and fitted, hold the veffel A B (fig. 6.) upright in your hands over a bason on a table, and cause water to be poured into the vessel flowly, till the pressure of the water bears down its bottom at the fide d, and raifes the weight E; and then part of the water will run out at d. Mark the height at which the furface H of the water flood in the vessel, when the bottom began to give way at d; and then, holding up the other veffel AB (fig. 5.) in the same manner, cause water to be poured into it at H: and you will fee, that when the water rifes to A in this veffel, just as high as it did in the former, its bottom will also give way at d, and it will lose part of

The natural reason of this surprising phenomenon is, that fince all parts of a fluid at equal depths below the furface are equally preffed in all manner of directions, the water immediately below the fixed part Bf (fig. 5.) will be preffed as much upward against its lower surface within the vessel, by the action of the column Ag, as it would be by a column of the same height, and of any diameter whatever; (as was evident by the experiment with the tube, fig. 4.) and therefore, fince action and reaction are equal and contrary to each other, the water immediately below the furface Bf will be pressed as much downward by it, as if it was immediately touched and preffed by a column of the height g A, and of the diameter Bf: and therefore the water in the cavity BD df will be preffed as much downward upon its bottom CC, as the bottom of the other veffel (fig. 6.) is preffed by

all the water above it.

To illustrate this a little farther, let a hole be made Fig. 5. at f in the fixed top B f, and let a tube G be put into it; then, if water be poured into the tube A, it will (after filling the cavity B d) rife up into the tube G, until it comes to a level with that in the tube A; which is manifestly owing to the pressure of the water in the tube A, upon that in the cavity of the veffel below it. Consequently, that part of the top Bf, in which the hole is now made, would, if corked up, be pressed upward with a force equal to the whole weight of all the water which is supported in the tube G: and the fame thing would hold at g, if a hole were made there. And so, if the whole cover or top B f were full of holes, and had tubes as high as the middle one A g put into them, the water in each tube would rife to the fame height as it is kept in the tube A, by pouring more into it, to make up the deficiency that it fustains by fupplying the others, until they are all full; and then the water in the tube A would support equal heights of water in all the rest of the tubes. Or, if all the tubes except A, or any other one, were taken away, and a large tube equal in diameter to the whole top Bf were placed upon it and cemented to it, and then if water were poured into the tube that was left in either of the holes, it would afcend through all the weffel and its brass bottom, for the fake of closeness. rest of the holes, until itsilled the large tube to the A 2

Fig. 5, 6.

Preffure of fame height that it flands in the small one, after a fuf- a piece of lead may be made to swim in water, by im-Preffure of ficient quantity had been poured into it: which shows, that the top Bf was pressed upward by the water under it, and before any hole was made in it, with a force equal that wherewith it is now pressed downward by the weight of all the water above it in the great tube. And therefore, the reaction of the fixed top B f must be as great, in pressing the water downward upon the bottom CC, as the whole pressure of the water in the great tube would have been, if the top had been taken away, and the water in that tube left to prefs directly upon the water in the cavity BD df.

The hydro-

Perhaps the best machine in the world for demonflatic bel- firating the opward preffure of fluids, is the hydrolows, fig. 7. static bellows, which confifts of two thick oval boards AB, EF, each about 16 inches broad, and 18 inches long: the fides are of leather, joined very close to the top and bottom by ftrong nails. CD is a pipe screwed into a piece of brass on the top-board at C. Let fome water be poured into the pipe at D, which will run into the bellows, and feparate the boards a little. Then lay three weights, each weighing 100 pounds, upon the upper board; and pour more water into the pipe, which will run into the bellows, and raife up the board with all the weights upon it; and if the pipe be kept full until the weights are raifed as high as the leather which covers the bellows will allow them, the water will remain in the pipe, and fupport all the weights, even though it should weigh no more than a quarter of a pound, and they 300 pounds: nor will all their force be able to cause them to defcend and force the water out at the top of the pipe.

> The reason of this will be made evident, by considering what has been already faid of the refult of the pressure of fluids of equal heights without any regard to their quantity. For if a hole be made in the upper board, and a tube be put into it, the water will rife in the tube to the fame height that it does in the pipe; and would rife as high (by supplying the pipe) in as many tubes as the board could contain holes. Now, suppose only one hole to be made in any part of the board, of an equal diameter with the bore of the pipe, and that the pipe holds just a quarter of a pound of water; if a person claps his finger upon the hole, and the pipe be filled with water, he will find his finger to be preffed upward with a force equal to a quarter of a pound. And as the same pressure is equal upon all equal parts of the board, each part, whose area is equal to the area of the hole, will be preffed upward with a force equal to that of a quarter of a pound: the fum of all which preffures against the under fide of an oval board 16 inches broad, and 18 inches long, will amount to 300lb.; and therefore fo much weight will be raifed up and supported by a quarter of a pound of water in the pipe.

How a man Hence, if a man stands upon the upper board, and

may raise blows into the bellows through the pipe, he will raise himfeif up himfelf upward upon the board: and the fmaller the ward by his bore of the pipe is, the eafier he will be able to raife himself. And then, by clapping his finger upon the top of the pipe, he can support himself as long as he pleases; provided the bellows be air-tight, so as not to lose what is blown into it.

Upon this principle of the upward pressure of sluids,

merfing it to a proper depth, and keeping the water Fluids. from getting above it. Let CD be a glass tube, open at both ends; and EFG a flat piece of lead, exactly How lead fitted to the lower end of the tube, not to go within may be it, but for it to ftand upon; with a wet leather be- made to tween the lead and the tube, to make close work. Let water. this leaden bottom be half an inch thick, and held Fig. 8. close to the tube by pulling the packthread IHL upward at L with one hand, whilit the tube is held in the other by the upper end C. In this fituation, let the tube be immerfed in water in the glass veffel AB, to the depth of fix inches below the furface of the water at K; and then, the leaden bottom EFG will be plunged to the depth of fomewhat more than eleven times its own thickness: holding the tube at that depth, you may let go the thread at L; and the lead will not fall from the tube, but will be kept to it by the upward pressure of the water below it occasioned by the height of the water at K above the level of the lead. For as lead is 11.33 times as heavy as its bulk of water, and is in this experiment immerfed to a depth fomewhat more than 11.33 times its thickness, and no water getting into the tube between it and the lead, the column of water EabeG below the lead is preffed upward against it by the water KDEGL all around the tube; which water being a little more than 11.33 times as high as the lead is thick, is fufficient to balance and fupport the lead at the depth KE. If a little water be poured into the tube upon the lead, it will increase the weight upon the column of water under the lead. and cause the lead to fall from the tube to the bottom of the glass vessel, where it will lie in the situation b d. Or, if the tube be raifed a little in the water, the lead will fall by its own weight, which will then be too great for the pressure of the water around the tube upon the column of water below it. But the following method of making an extremely heavy body float upon water is more elegant. Take a long glass tube, open at both ends; stopping the lower end with a finger, pour in some quickfilver at the other end, so as to take up about half an inch in the tube below. Immerse this tube, with the finger still at the bottom, in a deep glass vessel filled with water; and when the lower end of the tube is about feven inches below the furface, take away the finger from it, and then you will fee the quickfilver not fink into the veffel, but remain fuspended upon the tube, and floating, if we may so express it, upon the water in the glafs-veffel. In the fame manner as an heavy body was made to How light

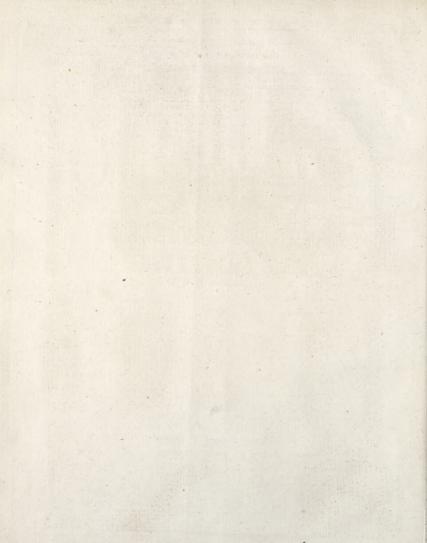

fwim on water, by taking away the upward preffure; wood may fo may a light body, like wood, be made to remain be made to funk at the bottom, by depriving it of all preffure he at the from below : for if two equal pieces of wood be planed, water. furface to furface, fo that no water can get between them, and then one of them (cd) be cemented to the infide of the veffel's bottom; then the other being placed upon this, and, while the veffel is filling, being kept down by a flick; when the flick is removed and the veffel full, the upper piece of wood will not rife from the lower one, but continue funk under water, though it is actually much lighter than water; for as there is no refistance to its under furface to drive it upward, while its upper furface is ftrongly preffed down,

it must necessarily remain at the bottom.

Specific Gravities SECT. III. Of the Specific Gravity of Bodies.

IO Of fpecific gravity.

WHEN an unspongy or folid body finks in a vessel of water, it removes a body of water equal to its own bulk, out of the place to which it descends. If, for instance, a copper ball is let drop into a glass of water, we well know, that if it finks, it will take up as much room as a globe of water equal to itself in fize took up before.

Let us fuppose, that this watery globe removed by the ball were frozen into a folid fubstance, and weighed in a scale against the copper ball: now the copper ball being more in weight than the globe, it is evident that it will fink its own fcale, and drive up the opposite, as all heavier bodies do when weighed against lighter; if, on the contrary, the copper ball be lighter than the water globe, the ball will rife. Again, then let us suppose the copper ball going to be immerfed in water; and that, in order to descend, it must displace a globe of water equal to itself in bulk. If the copper ball be heavier than the globe, its preffure will overcome the other's refistance, and it will fink to the bottom; but if the watery globe be heavier, its preffure upwards will be greater than that of the ball downward, and the ball will rife or fwim. In a word, in proportion as the ball is heavier than the fimilar bulk of water, it will descend with greater force; in proportion as it is lighter, it will be raifed more to the

From all this we may deduce one general rule, which will measure the force with which any folid body tends to fwim or fink in water; namely, Every body immersed in water, loses just as much of its weight as equals the weight of an equal bulk of water. Thus, for inflance, if the body be two ounces, and an equal bulk of water be one ounce, the body when plunged, will fink towards the bottom of the water with a weight of one ounce. If, on the contrary, the folid body be but one ounce, and the weight of an equal bulk of water be two ounces; the folid, when plunged, will remove but one ounce, that is half as much water as is equal to its own bulk: fo that, confequently, it cannot defeend; for to do that, it must remove a quantity of water equal to its own bulk. Again, if the folid be too ounces, and the equal bulk of water two ounces, the folid, wherever it is plunged, will neither rife nor fink, but remain fulpended at any depth.

Thus we fee the reason why fome bodies swim in water, and others fink. Bodies of large bulk and little weight, like cork or feathers, must necessarily fwim, becaufe an equal bulk of water is heavier than they; bodies of little bulk but great weight, like lead or gold, must fink, because they are heavier than an equal bulk of water. The bulk and the weight of any body confidered together, is called its specific gravity; and the proportion of both in any body is easily found by water. A body of little bulk and great weight, readily finks in water, and it is faid to have fpecific gravity; a body of great bulk and little weight, lofes almost all its weight in water, and therefore is faid to have but little specific gravity. A woolpack has actually greater real gravity, or weighs more in air, than a cannon ball; but for all that, a cannon ball may have more specific gra- filver being immerfed, would raise the water no higher vity, and weigh more than the woolpack, in water. than the crown immersed; and if the crown was of

Denfity is a general term that means the fame thing ; Specific specific gravity is only a relative term, used when folids Gravities. are weighed in fluids, or fluids in fluids.

As every folid finks more readily in water, in proportion as its specific gravity is great, or as it contains greater weight under a smaller bulk, it will follow, that the fame body may very often have different fpecific gravities, and that it will fink at one time and fwim at another. Thus a man, when he happens to fall alive into the water, finks to the bottom; for the fpecific gravity of his body is then greater than that of water: but if, by being drowned, he lies at the bottom for fome days, his body fwells by putrefaction, which difunites its parts; thus its specific gravity becomes less than that of water, and he floats upon the

Several more important uses are the result of our How to dif-

being able exactly to determine the fpecific gravities cover adulof bodies. We can, by weighing metals in water, terations in discover their adulterations or mixtures with greater exactness than by any other means whatsoever. By this means, the counterfeit coin, which may be offered us as gold, will be very easily diftinguished, and known to be a baser metal. For instance, if we are offered a brass counter for a guinea, and we suspect it; suppose, to clear our suspicions, we weigh it in the ufual manner against a real guinea in the opposite scale, and it is of the exact weight, yet still we suspect it; What is to be done? To melt or destroy the figure of the coin would be inconvenient and improper: a much better and more accurate method remains. We have only to weigh a real guinea in water, and we shall thus find that it loses but a nineteenth part of its weight in the balance: We then weigh the brafs counter in water, and we actually find it lofes an eighth part of its weight by being weighed in this manner. This at once demonstrates, that the coin is made of a base metal, and not gold; for as gold is the heaviest of all metals, it will lofe lefs of its weight by being weigh-

ed in water than any other. This method Archimedes first made use of to detect a fraud with regard to the crown of Hiero king of Syracufe. Hiero had employed a goldsmith to make him a crown, and furnished him with a certain weight of gold for that purpose; the crown was made, the weight was the fame as before, but still the king fufpected that there was an adulteration in the metal. Archimedes was applied to; who, as the flory goes, was for some time unable to detect the imposition. It happened, however, one day as the philosopher was stepping into a bath, that he took notice the water rofe in the bath in proportion to the part of his body immersed. From this accident he received a hint; wherewith he was fo transported, that he jumped out of the bath, and ran naked about the streets of Syracufe, crying in a wild manner, I have found it! I have found it !- In confequence of this speculation, he procured a ball of gold and another of filver, exactly of the weight of the crown, confidering, that if the crown were altogether of gold, the ball of gold would be of the fame bulk as the grown, and when immerfed in water, would raife the water just as high as the crown immerfed; but if it were wholly of filver, the ball of

gold

Specific gold and filver mixed in a certain proportion, this proportion would be discovered by the height to which the crown would raife the water higher than the gold and lower than the filver. Accordingly, let AMLB be a veffel filled with water to the height D C, and let the mass of gold, equal in weight to the crown, on being immerfed into the water, raife the furface of it to E, and the mass of filver raise it to G; then if the height of the veffel above D C be divided into equal parts, and DF=11, and DG=19, it is plain the bulks of gold and filver will be as D F to DG, and the specific gravities in the inverse proportion of these quantities, or as D G to D F. If the crown be immerfed, it will raise the furface of water to E; whence the proportion of the bulks of the gold and filver in the crown may be determined. For fince the difference of the specific gravities of the gold and filver is DG-DF=FG=8, if the bulk of the crown is divided into eight equal parts, it is evident, that fince. the specific gravities of the debased and pure gold crowns will be as the bulks inverfely, that is, as DF to DE, we can eafily find the point H, which will express the specific gravity of the former; for DE: DF:: DG: DH. This point H always divides the difference FG into two parts GH, HE, which have the fame proportion as the parts of filver in the crown to the parts of gold; for as the point E ascends, the point H descends, and when E coincides with G, H falls upon E, and the crown becomes wholly filver; on the contrary, when E descends to F, and Hascends to G, the crown becomes wholly gold; therefore FH will be every where to HG as the parts of gold to the parts of filver in the crown. Confequently, in the prefent case, because the crown, when immerfed, raifes the water to the height DE, and H is three divisions below G, it shows that three of the eight parts of the crown are filver, and the other five parts gold, as H is five of the divisions above F. Hence the bulk of the gold in the crown is to that of the filver as 5 to 3. In some such method as this Archimedes deduced his proposition, viz. that the difference of the specific gravities of the compound and lighter ingredient, i. e. 5 (supposing the specific gravity of gold to filver as 19 to 11, and the specific gravity of the king's crown to be 16), is to the difference of the specific gravities of the heavier ingredient and the compound, i. e. 3, as the bulk of gold to that of filver made up of: fo that if the whole crown were divided into eight parts, the gold would confift of five, and the filver of three; and the magnitudes 5 and 3, multiplied by the specific gravities 19 and 11 respectively, will give the numbers 95 and 33, expressing the proportion of the weight of the gold to that of the filver.

This proposition of Archimedes may be demonstrated analytically in the following manner: let the magnitudes of the gold and filver in the crown be A and B, and their specific gravities as a and b; then, fince the absolute gravity of any body is compounded of its magnitude and specific gravity, the weight of the gold is a A, of the filver b B, and of the crown $aA+bB=c\times A+B$, supposing c to be the specific gravity of the mixture. Hence aA-cA=cB-bB; and consequently c-b: a-c:: A: B, as before, height exceeds that of the bottle about two inches.

Upon this difference in the weight of bodies in open Specific air and water, the hydrostatic balance has been form- Gravities ed; which differs very little from a common balance, but that it hath an hook at the bottom of one scale, The hydro-

on which the weight we want to try may be hung by static baan horse-hair, and thus suspended in water, without lance. wetting the scale from whence it hangs. First, the weight of the body we want to try is balanced against the parcel or weight in open air; then the body is fuspended by the hook and horse-hair at the bottom of the fcale in water, which we well know will make it lighter, and destroy the balance. We then can know how much lighter it will be, by the quantity of the weights we take from the scale to make it equipoise ; and of confequence we thus precifely can find out its specific gravity compared to water (A). This is the most exact and infallible method of knowing the genuineness of metals, and the different mixtures with which they may be adulterated, and it will answer for all fuch bodies as can be weighed in water. As for those things that cannot be thus weighed, fuch as quickfilver, fmall sparks of diamond, and fuch like, as they cannot be suspended by an horse-hair, they must be put into a glass-bucket, the weight of which is already known: this, with the quickfilver, must be balanced by weights in the opposite scale, as before, then immerfed, and the quantity of weights to be taken from the opposite scale will show the specific gravity of the bucket and the quickfilver together: the specific gravity of the bucket is already known; and of confequence the specific gravity of the quickfilver, or any other similar fubstance, will be what remains. As we can thus discover the specific gravity of dif-

ferent folids by plunging them in the fame fluid, fo we can discover the specific gravity of different fluids, by plunging the fame folid body into them; for in proportion as the fluid is light, fo much will it diminish the weight of the body weighed in it. Thus we may know that fpirit of wine has less specific gravity than water, because a folid that will swim in water will link in spirit; on the contrary, we may know that spirit of nitre has greater specific gravity than water, because a folid that will fink in water will fwim upon the spirit of nitre. Upon this principle is made that fimple inftrument called an hydrometer, which ferves to measure The hydrothe lightness or weight of different fluids. For that meter. liquors weigh very differently from each other is found by experience. Suppose we take a glass-vessel which is divided into two parts, communicating with each other by a small opening of a line and an half diameter. Let the lower part be filled up to the division with red-wine, then let the upper part be filled with water. As the red-wine is lighter than water, we shall fee it in a short time rising like a small thread up through the water, and diffusing itself upon the surface, till at length we shall find the wine and water have changed their places; the water will be feen in the lower half, and the wine in the upper half, of the veffel. Or take a small bottle AB, the neck of which must be very narrow, the mouth not more than i of an inch wide; and have a glass-veffel CD, whose

fig. 2.

⁽A) This is the common hydroftatic balance. The reader will fee an improved apparatus at Hydroftatic BALANCE, in order of the alphabet.

Specific With a fmall funnel fill the bottle quite full of redfull of water. The wine will prefently come out of the bottle, and rife in form of a small column to the furface of the water; and at the same time the water, entering the bottle, will supply the place of the wine; for water being specifically heavier than wine, must hold the lowest place, while the other naturally rifes to the top. A fimilar effect will be produced if the bottle be filled with water, and the veffel with wine: for the bottle being placed in the vessel in an inverted position, the water will descend to the bottom of the veffel, and the wine will mount into the bottle.

In the same manner we may pour four different liquors, of different weights, into any glass-veffel, and they shall all stand separate and unmixed with each other. Thus, if we take mercury, oil of tartar, fpirit of wine, and spirit of turpentine, shake them together in a glass, and then let them fettle a few minutes, each shall stand in its proper place, mercury at the bottom, oil of tartar next, spirit of wine, and then spirit of turpentine above all. Thus we see liquors are of very different denfities; and this difference it is that the hydrometer is adapted to compare. In general, all vinous spirits are lighter than water; and the less they contain of water, the lighter they are. The hydrometer, therefore, will inform us how far they are genuine, by showing us their lightness; for in pure spirit of wine it finks less than in that which is mixed with a small quantity of water.

The hydrometer should be made of copper: for ivory imbibes spirituous liquors, and thereby alters their gravity; and glass requires an attention that is incompatible with expedition. The most simple hydrometer confifts of a copper ball B b, to which is foldered a brafs wire AB, one quarter of an inch thick. The upper part of this wire being filed flat, is marked proof, at m, fig. 4. because it finks exactly to that mark in fig. 3. to show whether the liquor be one-tenth above or below proof, according as the hydrometer finks to A, or emerges to B, when a brass weight, as C or K, is ferewed to its bottom c. There are other weights to screw on, which show the specific gravity of different fluids, quite down to common water.

The round part of the wire above the ball may be marked fo as to reprefent river-water when it finks to RW, fig. 4. the weight which answers to that water being then fcrewed on; and when put into fpringwater, mineral-water, fea-water, and water of falt fprings, it will gradually rife to the marks SP, MI, SE, SA. On the contrary, when it is put into Briftol water, rain-water, port-wine, and mountain-wine, it will fucceffively fink to the marks br, ra, po, mo-Instruments of this kind are sometimes called arcometers.

There is another fort of hydrometer that is calculated to ascertain the specific gravity of fluids to the greatest precision possible, and which confists of a large hollow ball B, fig. 5. with a smaller ball b screwed on to its bottom, partly filled with mercury or fmall fhot, in order to render it but little specifically lighter than water. The larger ball has also a short neck at C, into which is ferewed the graduated brass-wire AC, which, by a small weight at A, causes the body of the inftrument to defeend in the fluid, with part of fit to take fire. Proof-spirit of any kind weighs feven the ftem.

When this inftrument is swimming in the liquor Gravities wine, and place it in the veffel CD, which is to be contained in the jar ILMK, the part of the fluid difplaced by it will be equal in bulk to the part of the instrument under water, and equal in weight to the whole instrument. Now, suppose the weight of the whole to be four thousand grains, it is then evident we can by this means compare the different dimensions of four thousand grains of feveral forts of fluids. For if the weight at A be such as will cause the ball to fink in rain-water till its furface come to the middle point of the stem 20; and after that, if it be immerfed in common fpring-water, and the furface be observed to ftand at one-tenth of an inch below the middle point 20; it is apparent, that the same weight of each water differs only in bulk by the magnitude of one-tenth of an inch in the stem.

Now, suppose the stem to be ten inches long, and to weigh a hundred grains, then every tenth of an inchwill weigh one grain: and as the stem is of brass, which is about eight times heavier than water, the fame bulk of water will be equal to one eighth of a grain, and confequently to the one-eighth of one fourthousandth part, that is, one thirty-two thousandth part of the whole bulk. This instrument is capable of still greater precision, by making the stem or neck confift of a flat thin flip of brafs, instead of one that is cylindrical; for by this means we increase the furface, which is the most requisite circumstange, and diminish the folidity, which necessarily renders the inftrument still more accurate.

To adapt this instrument to all purposes, there should be two stems, to screw on and off, in a small. hole at a. One flem should be a smooth thin slip of brass, or rather steel, like a watch spring set straight, fimilar to that we have just now mentioned; on one fide of which is to be the feveral marks or divitions to which it will fink in different forts of water, as rainriver, fpring, fea, and falt-fpring waters, &c.; and proof-fpirits. There are two other marks at A and B, on the other fide you may mark the divitions to which it finks in various lighter fluids, as hot Bath water, Briftol water, Lincomb water, Cheltenham water, port-wine, mountain, madeira, and other forts of wines. But here the weight at A on the top must be a littleless than before when it was used for heavier waters.

But in trying the strength of the spirituous liquors, a common cylindric item will do belt, because of its ftrength and fteadiness: and this ought to be fo contrived, that, when immerfed in what is called prooffpirit, the furface of the spirit may be upon the middle point 20; which is eafily done by duly adjulling the fmall weight A on the top, and making the ftem of fuch a length, that, when immerfed in water, it may just cover the ball and rife to a; but, when immerfed in pure spirit, it may rise to the top A. Then, by dividing the upper and lower parts a 20 and A 20, into ten equal parts each, when the instrument is immerfed into any fort of spirituous liquor, it will immediately fhow how much it is above or below proof.

Proof-spirit consists of half water and half pure spirit, that is, fuch as, when poured on gun powder, and fet on fire, will burn all away; and permits the powder to take fire and flash, as in open air. But if the spirit be not so highly rectified, there will remain fome water, which will make the powder wet, and unpounds twelve ounces per gallon.

The common method of shaking the spirits in a in its horizontal diameter. It has a square stem A D, manner of rifing or breaking whether the fpirit be proof, or near it, is very fallacious. There is no way fo certain, and at the fame time fo eafy and expeditious, as this by the hydrometer.

New im-

A variety of different conftructions of the hydromeproved hy ter have recently been made with a particular view drometer. of improving the instrument, fo as to ascertain the firengths of spirits, and worts in brewing, in the most easy and accurate manner. As it would be unneceffary to describe all of them here, we shall conclude this fection with descriptions of those only which have Objection been most approved and are now in general use. The Cufto Clarke's, toms have for a long time adopted an hydrometer of an old construction, by the late Mr Clarke. It differs very little from the one above defcribed (fig. 3. 4.); and has belonging to it a great variety of weights, which are occafionally fecured on to the bottom of the ftem: This renders the instrument troublesome and complicated in its use, and where dispatch in business and accuracy are wanted, not fo commodious as fuch an instrument

Hydrometer made by Jones.

An hydrometer upon a very fimple construction, eafy in its application, and fufficiently accurate for the common purpofes it is wanted to answer, by distillers and others concerned in the fale and ftate of spirits, is made by Mr Wm. Jones mathematical instrument maker in Holborn. It requires only three weights, to discover the strengths of spirits from alcohol down to water. This hydrometer, like others, is adjusted to a temperate state of the air, or 60° of the thermometer with Fahrenheit's fcale; but as an alteration of this temperature very materially affects the gravity of spirits, causing them by the instrument to appear stronger when the weather is hotter, and the contrary, it has been found indispensably necessary to place a thermometer in the fpirits previous to the immerfing of the instrument, and make a just allowance for the feveral degrees that the mercury may be above or below the temperature above mentioned. This has been usually, though inaccurately, estimated at the rate of one gallon allowance for every three degrees of the thermometer above or below 60°; viz. for every three degrees warmer, reckoning the spirit one gallon in the 100 weaker than what is shown by the hydrometer; and for every three degrees colder than 60°, allowing one gallon in the 100 ftronger. In this hydrometer, the thermometer is united with the inftrument; and from experiment its divisions are adjusted to the different degrees above or below the temperate state. The concentration is also considered in this instrument, which is the mutual penetration of fpirit and water when mixed together; which in strong spirits is fo considerable as to cause a diminutution of 4 gallons in the 100: for example, if to 100 gallons of spirit of wine, found by the instrument to be 66 gallons in the 100 over proof, you add 66 gallons of water in order to reduce it to a proof state; the mixture, instead of producing 166 gallons, will produce 162 gallons only of proof spirits, and therefore 4 gallons will be loft in the mutual penetration of the particles of the water and fpirit.

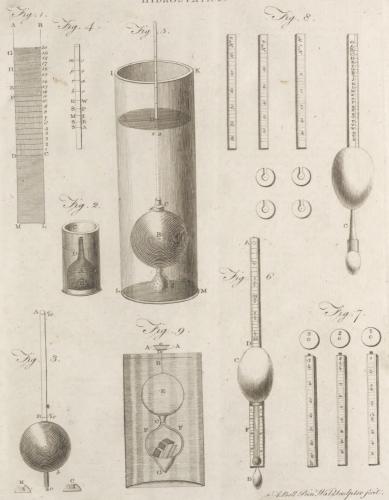

Fig. 6. is a reprefentation of the whole inftrument,

Nº 161.

phial, and raifing a head of bubbles, to judge by their on the four fides of which are graduated the different Gravities. firengths of the spirit. The other three sides not shown in this figure are reprefented in fig. 7. with the three weights belonging to them, marked no 1. 2. and 3. corresponding to the fides fimilarly marked at the top. When the infrument is placed in the fpirit to be tried, if it finks to the divisions on the stem without a weight, the ftrength will be shown on the side marked o on the top; and it will indicate any firength from 74 gallons in the 100, to 47 to the 100 above proof. The fmall figures, as 4 at 66, 31 at 61, 21 at 48, &c. flow the concentration by mixture above mentioned, viz. the rate of diminutions that will take place, by making a mixture with water, to reduce the fpirit at those strengths to proof. If the hydrometer does not fink to the ftem without a weight, it must be made to do fo by applying either of the three weights requifite. The fide no 1. with the weight no 1. shows the ftrength of spirits from 46 to 13 gallons to the 100 above proof, as before. The concentration figures are 2, 11, &c. the use as before. The fide no 2. with the weight no 2. shows the remainder of the over-proof to proof, the division of which is marked P on the instrument, and every gallon in 100 under proof down to 29. The fide no 3. with its weight, shows the remainder from 30 gallons in the 100 under proof down to water, marked W, which may be confidered 100 in 160. The application of the thermometer (F) now appears eafy and expeditious; for as it is immerfed in the spirits with the hydrometer, they both may be observed at one experiment or trial. The scale of the thermometer is divided into four columns; two on one fide, as shown in the figure, and two on the other. At the top of the columns are marks o. 1.2. 3. agreeing with the weights, or no weight, in use; and that column of divisions of the thermometer is to be obferved which corresponds with the weights in use; if no weight is used, then the column marked o is observed. The divisions of the thermometer commence from the middle of each column at the temperate point, which is marked o: then for as many divisions as the quickfilver in the tube appears above o, fo many gallons in the 100 must the spirit be reckoned weaker; and for fo many divisions as the quickfilver may appear below 0, as many gallons in the 100 must be reckoned

more weights, Mr Jones makes for difcovering to great exactness the different strengths or specific gravity of worts in brewing, of different minerals, fea waters, &c. For these purposes the thermometer is not united with the inflrument; but is found to be more useful separately, and of a larger dimension. Notwithstand- One by Mr ing the above hydrometer answering the general purpo- Dicas with fes in an accurate and eafy manner, yet the industry of a sliding feveral ingenious perfons interested in the fale of fpirits rule. has been exerted to construct an instrument of the greatest possible exactness. The effects of heat and cold upon different strengths of spirits not being to uniform as generally understood, and every different degree of ftrength of fpirit between water and alcohol having its peculiar degree of contraction and dilatation, errors of fome importance must be found in the hydrometers conwith the thermometer united. Its length A B is a- ftructed upon the usual principle of temperature. With bout 91 inches; its ball C, is of the shape nearly of a view to obviate this defect, Mr Dicas of Liverpool an egg, and made of hard brafs, and about 11 inch e onftructed fome years back an hydrometer of the form

Hydrometers of a fimilar construction, and with no

hydronic-

ecr.

generally used, with 36 weights, which were valued and against D you have 75 gallons to the 100 over Specific from o to 370, including the divisions on the stem; but proof; at this strength the concentration is 5 gallons Gravities. the improvement confifts folely in an ivory fliding rule (marked above 75); and the specific gravity is nearly which accompanies the inftrument. In the graduation 811, as marked below D: fo that if 75 gallons of waof this rule, is confidered the different effects of heat ter are added to 100 gallons of this spirit, the mixture and cold above-mentioned on the spirits. Every de- will be hydrometer proof; but will only produce in gree of frength included by the hydrometer between measure 170 gallons. Again, let the heat be 50°, and o and 370, has the fame feries of numbers placed on the spirit require the weight no 1. to fink the inftruthe fliding part of the rule; opposite to which, on the ment to I on the stem; then put the star to 500 of fixed rule, are marked the different strengths, and which heat, and against I on the siding rule you have 52 1 are thus determined by immediate inspection. They gallons to 100 over proof, concentration 21/2 gallons, proceed on one fide from water to proof, and on the other from proof to alcohol, and divided in such a manrits are above or below proof. There is also a line, containing the concentration for every degree of ftrength; and, what is the chief advantage of the rule, at one end of the fide is placed a feale, containing the degree of heat from 30 to 80 of Fahrenheit's scale, with a flower de luce opposite, as an index, to fix it to the temperature of the foirits. By the affiftance of this fliding rule, the exact state of the spirits is correctly obtained. A perfect comprehension of this rule can only be had by an inspection of it, and it always accompanies the hydrometer on fale. Mr Dicas has obtained a patent for his improvement.

Mr Quin's An hydrometer of a more universal construction has been made by Mr Quin, who for many years has been accustomed to construct hydrometers of various kinds, This hydrometer is made of hard brafs: and therefore not fo liable to be injured as fine copper, of which hydrometers are usually made: it is constructed so as to afcertain, in a plain and expeditious manner, the ftrength of any spirit from alcohol to water, with the concentration and specific gravity of each different strength; and discovers also the weight of worts, &c. with four weights only; which, according to the old construction of hydrometers, would require a far greater number of weights. Fig. 8. is a representation of the inftrument. with its four fides of the stem graduated and figured at top, to correspond with the weights below. The fide of the square-stem engraved A, B, C, D, &c. to Z, shows the strength of any spirit from alcohol to water; and the three other fides, numbered 1, 2, 3, are adapted for worts, &c. The heat and cold altering the denfity of spirits, and giving to every degree of strength a peculiar degree of contraction and dilatation; this circumstance is considered in dividing the sliding rule belonging to and fold with the hydrometer. This fliding rule is nearly fimilar to that of Mr Dicas's abovementioned, and differs but very little from it. Some directions for the use of this hydrometer may further

> Find the heat of the spirit by a thermometer, and bring the star on the sliding rule to the degree of heat on the thermometer scale, and against the number of the weight and letter on the flem you have the ftrength of the spirit pointed out on the sliding rule, which is lettered and numbered as the instrument and weights are.

The weights apply on the under stem at C.

exemplify its simplicity and accuracy.

thermometer, and of fuch firength as to fink the hy- in any gravity, and for fermentation; but for more accudrometer to D on the stem, without any weight; then racy in this particular Mr Quin completes a scale which

Vol. IX. Part I.

and the specific gravity 854.

If the instrument with the weight no 2. should fink ner, as to show how many gallons in the 100 the spi- to Q on the stem, and the heat 41°, it shows the firength 19 gallons to the 100 over proof, concentra-

tion 3, specific gravity 905.

If the spirit be at 32° of heat, and the weight no 3. finks the instrument to letter S on the stem on the fliding rule, it shows the liquor to be 13 gallons in the 100 under proof, concentration 1, specific gravity 945. So of the reft. In afcertaining the strength or gravity of worts, the weight no 4. is always to continue on the hydrometer; and the weights no 1, 2, 3, are adapted to the fides no 1, 2, 3, of the square stem; which discovers the exact gravity of the worts.

The instrument is adjusted so as to fink in rain water at 60° of the thermometer with the weight no I. to W, on the fide of the stem no 1. and shows to 260 heavier than water. The fide no 2. with its corresponding weight no 2. shows from 260 to 530, and the fide no 3. ascertains from 53° to 81°, or 40% pounds per barrel heavier than water; two degrees on the stem

being a pound per barrel.

To use the hydrometer in ascertaining the gravity of two or more worts.

Rule. Multiply the gravity of each wort by its refpective number of barrels or gallons; divide the fum of the products by the number of gallons or barrels; the quotient will be the mean gravity required.

Suppose first wort 30 barrels. at 600 gravity. fecond wort 20 barrels, 35° gravity.

50)2500(50° mean gravity required.

When the heat of the worts cannot be conveniently tried at 600 of the thermometer, the following small table shows the number of divisions to be added for the

Degrees of the thermometer 60 o Degrees of 72 thehydro-82 2 meter to be 91 3 added. 99

This table is not philosophically true; yet the error Example. Suppose the heat of the spirit 650 by the from it will not exceed a quarter of a pound per barrel put the star (on the rule) to 65° of the thermometer, may be applied to any particular degree of heat.

Mr

Specific

Mr Nicholfon has lately improved the confruction Gravities, of the hydrometer, and made it a new inftrument for measuring the specific gravity of bodies; and for that purpose it appears the most accurate of any yet constructed. See fig. 9. where AA represents a small scale, which may be taken off at D; diameter 11 inch, weight 44 grains. B a stem of hardened steel wire; diameter 1 inch. E a hollow copper globe ; diameter 2 8 inches, weight with stem 369 grains. FF a stirrup of wire fcrewed to the globe at C. G a fmall fcale ferving likewife as a counterpoile; diameter 1 inch, weight with flirrup 1634 grains. The other dimensions may be had from the figure, which is + of the linear magnitude of the instrument itself.

In the construction, it is assumed, that the upper fcale shall constantly carry 1000 grains when the lower scale is empty, and the instrument funk in distilled water at the temperature of 60° Fahrenheit to the middle of the wire or ftem. The length of the ftem is arbitrary, as is likewise the distance of the lower scale from the surface of the globe. But the length of the stem being settled, the lower scale may be made lighter, and confequently the globe less, the greater its distance is taken from the surface of the globe; and the contrary. It is to be noted that the diameter of each scale must not be less than the side of a cube of

water weighing 1000 grains.

The distances of the upper and lower scales respectively from the nearest surface of the globe being fettled, add half the fide of a cube of water weighing 1000 grains to the diftance of the upper scale. This increased distance, and the faid distance of the lower fcale, may be confidered as the two arms of a lever; and, by the property of that mechanical power,

As the number expressing the lower distance, Is to the whole weight above; namely 1000 grains added to the weight of the upper scale;

So is the number expressing the upper distance, To the lower weight, when the instrument has no

tendency to any one position.

This last found weight must be considerably increafed, in order that the instruments may acquire and

preferve a perpendicular position.

Add together into one fum the weight of the lower scale thus found, the weight of the upper scale and its load, and the estimate weight of the ball and wires. Find the folid content of an equal weight of water; and thence, by the common rules of mensuration the diameter of an equal fphere. This will be the diameter, from outlide to outlide, of the globe that will float

As this process, and every other part of the present description, may be easily deduced from the well known laws of hydrostatics, it is unnecessary to enlarge here

on the demonstrative part.

To measure the specific gravities and thermometrical expansions of sluids. If the extreme length or height of the instrument be moderate, its weight, when loaded, will be about 3100 grains. It is, however, necesfary in practice, that its weight should be accurately found by experiment. This whole weight is equal to that of a quantity of diffilled water at the temperature of 60°, whose bulk is equal to that part of the instrument which is below the middle of the stem. If, therefore, the inftrument be immerfed to the middle of the flem in any other fluid at the same temperature

(which may be done by altering the load), the differ- Specific ence between this last load and 1000 grains will be the Gravities. difference between equal bulks of water and of the other fluid, the weight or the mass of water being known to be 3100 grains. If the faid difference be excess above 1000 grains it must be added, or if it be defect fubtracted from 3100 grains: the fum or remainder will be a number whose ratio to 3100 will express the ratio of the specific gravity of the assumed fluid to that of water. And this ratio will be expreffed with confiderable accuracy; for the inftrument having a cylindrical stem of no more than 1 of an inch diameter, will be raifed or depressed near one inch by the fubtraction or addition of To of a grain, and will therefore indicate with eafe fuch mutations of weight as do not fall fhort of 10 of a grain, or x 1000th part of the whole. Consequently, the specific gravities of all fluids, in which this instrument can be immerfed, will be found to five places of figures.

Sect. III

It is evident, that this instrument is a kind of thermometer, perhaps better adapted than the common one for measuring the expansions of fluids by heat. As the fluid, in the common thermometer, rifes by the excefs of expansion of the fluid beyond the expansion of the glass vessel; so this instrument will fall by the excess of the same expansion beyond the proper expansion of

the materials it is composed of.

To measure the specific gravities of solid bodies. The solid bodies to be tried by this inflrument must not exceed 1000 grains in weight. Place the instrument in distilled water, and load the upper scale or dish till the furface of the water interfects the middle of the ftem. If the weights required to effect this be exactly 1000grains, the temperature of the water answers to 60° of Fahrenheit's scale; if they be more or less than 1000 grains, it follows, that the water is colder or warmer. Having taken a note of this weight, unload the scale, and place therein the body whose specific gravity is required. Add more weight, till the furface of the water again bifects the stem. The difference between the added weight and the former load is the weight of the body in air. Place now the body in the lower scale or dish under water, and add weights on the upper scale till the surface of the water once more bifects the flem. This last added weight will be the difference between 1000 grains and the weight of the body in water. To illustrate this by an example.

N. B. The specific gravity of lead and tin, and (probably other metals) will vary in the third figure when the same piece of metal is melted and cooled a fecond time. This difference probably arises from the arrangement of the parts in cooling more or lefs fuddenly

specific gra-

When the instrument is once adjusted in distilled wa-Gravities. ter, common water may be afterwards used. For the ratio of the specific gravity of the water made use of

to that of distilled water being known (= , and the ratio of the specific gravity of the solid to the water made use of being also known ($=\frac{1}{h}$), the ratio of the fpecific gravity of the folid to that of diffilled water will be compounded of both (that is, $\frac{1}{ab}$).

There is reason to conclude from the experiments of various authors, that they have not paid much attention either to the temperature or specific gravity of the water they made use of. They who are inclined to be contented with a less degree of precision than is intended in the conftruction here described, may change the stem, which for that purpose may be made to take out for a larger.

One of the greatest difficulties that attends hydroflatical experiments, arises from the attraction or repulfion that obtains at the furface of the water. After trying many expedients to obviate the irregularities arising from this cause, Mr Nicholson finds reason to prefer the fimple one, of carefully wiping the whole instrument, and especially the stem, with a clean cloth. The weights in the dish must not be esteemed accurate while there is either a cumulus or a cavity in the

water round the stem.

Yet, after all, we cannot with great geometrical certainty rely upon either the hydrometer or the hydroftatic balance; for there are fome natural inconvepiences that difturb the exactness with which they difcover the specific gravities of different bodies. Thus, if the weather be hotter at one time than another, all fluids will fwell, and confequently they will be lighter than when the weather is cold: the air itself is at one time heavier than at another, and will buoy up bodies weighed in it; they will therefore appear lighter, and will of confequence feem heavier in water. In fhort, there are many causes that would prevent us from making tables of the specific gravities of bodies, if rigorous exactness were only expected; for the individuals of every kind of substance differ from each other, gold from gold, and water from water. In fuch tables, therefore, all that is expected is to come as near the exact weight as we can; and from an inspection into feveral, we may make an average near the truth. Thus, Muschenbroek's table makes the specific gravity of rain-water to be nearly eighteen times and an half less than that of a guinea; whereas our English tables make it to be but feventeen times and an half, nearly, less than the same. But though there may be some minute variation in all our tables, yet they in general may ferve to conduct us with fufficient accuracy.

In constructing tables of specific gravities with accuracy, the gravity of water must be represented by unity or 1.000, where three cyphers are added to give room for expressing the ratios of other gravities in decimal parts, as in the following table.

each body.

How to find out the quanmetale.

The use of the table of specific gravities will best appear by an example. Suppose a body to be compounded of gold and filver, and it is required to find tity of adul- the quantity of each metal in the compound.

First find the specific gravity of the compound, by weighing it in air and in water; and dividing its aerial weight by what it lofes thereof in water, the quotient will show its specific gravity, or how many times it is heavier than its bulk of water. Then fubtract the specific gravity of filver (found in the table) from that of the compound, and the specific gravity of the compound from that of gold; the first remainder shows the bulk of gold, and the latter the bulk of filver, in the whole compound: and if these remainders be multiplied by the respective specific gravities, the products will show the proportion of weights of each metal in the body.

Suppose the specific gravity of the compounded body be 13; that of flandard filver (by the table) is 10.5, and that of gold 19.63: therefore 10.5 from 13, remains 2.5, the proportional bulk of the gold; and 13 from 19.63, remains 6.63, the proportional bulk of filver in the compound. Then, the first remainder 2.5, multiplied by 19.63, the specific gravity of gold, produces 49.075 for the proportional weight of gold; and the last remainder 6.63 multiplied by 10.5, the specific gravity of filver, produces 69.615 for the proportional weight of filver in the whole body. So that for every 40.07 ounces or pounds of gold, there are 69.6 pounds or ounces of filver in the body.

Hence it is easy to know whether any suspected metal be genuine, or allayed, or counterfeit; by finding how much it is heavier than its bulk of water, and comparing the same with the table: if they agree, the metal is good; if they differ, it is allayed or coun-

terfeited.

Liquors.

A cubical inch of good brandy, rum, or other proof Hew to try spirits, weighs 235.7 grains; therefore, if a true inch cube of any metal weighs 235.7 grains less in spirits than in air, it shows the spirits are proof. If it loses less of its aerial weight in spirits, they are above proof; if it loses more, they are under: For, the better the fpirits are, they are the lighter; and the worfe, the heavier.

SECT. IV. Hydraulics.

HYDRAULICS is that part of hydroftatics, which teaches to estimate the swiftness or the force of fluids in motion.

It has been always thought an inquiry of great curiofity, and fill greater advantage, to know the causes by which water ipouts from veffels to different heights and diffances. We have observed, for instance, an open veffel of liquor upon its fland, pierced at the bottom: the liquor, when the opening is first made, fpouts out with great force; but as it continues to run, becomes less violent, and the liquor flows more feebly. A knowledge of hydraulics will instruct us in the cause of this diminution of its ftrength; it will show precisely how far the liquor will fpout from any veffel, and how fast or in what quantities it will flow. Upon the principles of this science, many machines worked

Hydraulics ounces avoirdupois are contained in a cubic foot of by water are entirely conftructed; feveral different en-Hydraulics. gines used in the mechanic arts, various kinds of mills, pumps, and fountains, are the refult of this theory, ju-

diciously applied. And what is thus demonstrated of the bottom of the The veloveffel, is equally true at every other depth whatfrever. city of Let us then reduce this into a theorem: The velocity water. with which water spouts out at a hole in the fide or bottom of a veffel, is as the fquare root of the depth or distance of the hole below the furface of the water. For, in order to make double the quantity of a fluid run through one hole as through another of the same size, it will require four times the preffure of the other, and therefore must be four times the depth of the other below the furface of the water: and for the fame reason, three times the quantity running in an equal time through the fame fort of hole, must run with three times the velocity; which will require nine times the pressure, and consequently must be nine times as deep below the furface of the fluid : and fo on .- I'o prove plate this by an experiment: Let two pipes, as C and g, of coxxxix; equal-fized bores, be fixed into the fide of the veffel fig. 9., AB; the pipe g being four times as deep below the furface of the water at b in the vessel as the pipe C is: and whilft these pipes run, let water be constantly poured into the veffel, to keep the surface still at the same height. Then if a cup that holds a pint be so placed as to receive the water that spouts from the pipe C, and at the fame moment a cup that holds a quart be fo placed as to receive the water that fpouts from the pipe g, both cups will be filled at the fame

time by their respective pipes. The horizontal distance to which a fluid will spout The horifrom a horizontal pipe in any part of the fide of an zontal di-upright vessel below the surface of the sluid, is equal to which was twice the length of a perpendicular to the fide of the ter will veffel, drawn from the mouth of the pipe to a femi-fpout from circle described upon the altitude of the fluid: and Pipes.

therefore, the fluid will fpout to the greatest distance possible from a pipe whose mouth is at the centre of the semicircle; because a perpendicular to its diameter (supposed parallel to the fide of the vessel) drawn from that point, is the longest that can possibly be drawn from any part of the diameter to the circumference of the semicircle. Thus, if the vessel AB be full of water, the horizontal pipe D be in the middle of its fide, and the femicircle Nedeb be deferibed upon D as a centre, with the radius or femidiameter Dg N, or Dfb, the perpendicular Dd to the diameter N D b is the longest that can be drawn from any part of the diameter to the circumference Nedeb. And if the veffel be kept full, the jet G will spout from the pipe D, to the horizontal distance NM, which is double the length of the perpendicular D d. If two other pipes, as C and E, be fixed into the fide of the veffel at equal distances above and below the pipe D, the perpendiculars C c and E.e, from these pipes to the femicircle, will be equal: and the jets F and H fpouting from them will each go to the horizontal diftance NK; which is double the length of either of the equal perpendiculars Cc or Dd.

Fluids by their pressure may be conveyed over hills and How water valleys in bended pipes, to any height not greater than may be the level of the fprings from whence they flow. This conveyed is what the ancients were ignorant of; and therefore and val-

they leys.

Hydraulics, they usually built AQUEDUCTS (vast rows of arches one

above another, between two hills, at a valt expence of money, time, and labour), in order to convey water over them, crofs the valley, in a common channel. This is now done to equal advantage, and at much lefs expence, by a range of pipes laid down one hill and up the other. An instance whereof may be given by a bent tube or crane; into one of the equal legs whereof if water be poured, it will rife to the fame level exactly in the other. The reason is obvious: In the leg A, (fig. 14.) there are, suppose, two ounces of water endeavouring by the power of gravity to defcend with the force of 2; thefe will thrust forward, buoy up, and fupport an equal quantity of a like fluid in B; and the bottom of the machine C, against which both fides equally bear, will of confequence fustain a double pressure, or that of four ounces; and in the present cafe will pretty well represent the prop or fixed point of a balance beam; as the equal fluid-columns A.C. and B.C. may be admitted to denote equal weights, fulpended on the balance arms, counterpoifing each other. So that the rife of fluids to their first level, thus considered, is a case truly statical; and all their other motions proceed only from weight

added.

A lyphon, generally used for decanting liquors, is a bended pipe, whose legs are of unequal lengths; and the shortest leg must always be put into the liquor intended to be decanted, that the perpendicular altitude of the column of liquor in the other leg may be longer than the column in the immerfed leg, especially above the furface of the water. For, if both columns were equally high in that respect, the atmosphere, which preffes as much upward as downward, and therefore acts as much upward against the column in the leg that hangs without the veffel, as it acts downward upon the surface of the liquor in the veffel, would hinder the running of the liquor through the fyphon, even though it were brought over the bended part by fuction. So that there is nothing left to caufe the motion of the liquor, but the fuperior weight of the column in the longer leg, on account of its having the

greater perpendicular height.

Let D be a cup filled with water to C; and A B C a fyphon, whose shorter leg BCF is immerfed in the water from C to F. If the end of the other leg were no lower than the line AC, which is level with the furface of the water, the fyphon would not run, eventhough the air should be drawn out of it at the mouth A. For although the fuction would draw fome water at first, yet the water would stop at the moment the fuction ceased; because the air would act as much upward against the water at A, as it acted downward for it by pressing on the surface at C. But if the leg AB comes down to G, and the air be drawn out at G by fuction, the water will immediately follow, and continue to run until the furface of the water in the cup comes down to F; because, till then, the perpendicular height of the column BAG will be greater than that of the column CB; and, confequently, its weight will be greater, until the furface comes down to F; and then the fyphon will flop, though the leg CF should reach to the bottom of the cup. For which reason, the leg that hangs without the cup is always made

as from d to E: and then, when the fyphon is emp. Hydraulics. tied of air by fuction at E, the water immediately follows, and by its continuity brings away the whole

from the cup; just as pulling one end of a thread will make the whole clue follow.

If the perpendicular height of a fyphon, from the furface of the water to its bended top at B, be more than 33 feet, it will draw no water, even though the other leg were much longer, and the fyphon quite emptied of air, because the weight of a column of water 33 feet high, is equal to the weight of as thick a column of air, reaching from the furface of the earth to the top of the atmosphere: fo that there will then be an equilibrium; and confequently, though there would be weight enough of air upon the furface C to make the water afcend in the leg CB almost to the height B, if the fyphon were emptied of air, yet the weight would not be fufficient to force the water over the bend; and therefore it could never be brought into the leg BAG.

Mercury may be drawn through a fyphon in the fame manner as water; but then the utmost height of the fyphon must always be less than 30 inches, as mercury is near 14 times heavier than water. That fluids are forced through the fyphon by the preffure of the atmosphere, is proved experimentally by the air pump; for, if a fyphon immerfed in a veffel of water be placed when running in the receiver, and the air extracted, the running will immediately ceafe. It is however certain, that a fyphon of a particular kind, once fet a running, will perfift in its motion. though removed into the most perfect vacuum our airpumps will make : or, if the lower orifice of a full fyphon be shut, and the whole be thus placed in a receiver, with a contrivance for opening the orifice when the air is exhausted; the water will be all emptied out of the

veffel, as if it had been in open air.

This fact has been fufficiently afcertained by many approved hydroflatical writers. Defaguliers informs us, that he made the experiment both with water and mercury; for having filled a fyphon, recurved at the extremities of its legs, fucceffively with those liquors, and fuspended it by a slip wire in the receiver of an airpump, over two finall jars containing mercury to unequal heights (and water, when water was used in the fyphon), he exhausted the air out of the receiver, and then letting down the fyphon, fo that its two ends went into the liquor in the jars, the liquor ran from the higher into the lower veffel. He also made an experiment in the open air, where the mercury ran through a fyphon, whose bend was more than 31 inches above the lower orifice of the fhort leg of the fyphon. But neither of thefe experiments afford a just objection against the preceding doctrine, viz. that the air is the cause of the discharge of liquors from one vessel into another. by means of fyphons; for its running in vacuo was only owing to the attraction of cohesion, which acts for a fmall height; because the experiment will not succeed in vacuo, if the fyphon used for mercury has its bend fix inches higher than the orifice of the fhort leg, and if the bend for the fyphon of water be two or three feet high; neither will the last mentioned with mercury in the open air answer, if the bend of the syphon be forty inches high : and in all the experiments the bores long enough to reach below the level of its bottom; of the fyphons must be very fmall.

Fig. 10.

The fy-

phon.

(fee fig. 1.2.3.) provided only the orifice C be below the CCXLII. level of the furface of the water to be drawn up; but Hill the farther it is distant from it, the faster will the fluid be carried off. And if, in the course of the flux, the orifice A be drawn out of the fluid, all the liquor in the fyphon will go out at the lower orifice C; that in the leg CB dragging, as it were, that in the shorter leg A B after it. If a filled fyphon be fo difpofed, as that both orifices A and C be in the fame horizontal line; the fluid will remain pendant in each leg, how unequal foever the length of the legs may be. Fluids, therefore, in fyphons, feem as it were to form one continued body; fo that the heavier part descending like a

chain, pulls the lighter after it.

Upon the principle of the fyphon depend the experiments of Tantalus's cup, no 44; the Fountain at command, no 45; and the inverted drinking-glass, no 58. As to the last of these, it may be here observed, that if the paper was put dry on fuch a veffel empty, it would fink in the air, and fall away even by its own gravity; and if put on wet, it were to be doubted whether a very fmall weight added thereto would not feparate it from the glass, so inconsiderable would the tenacity of the water be in this case. The paper therefore cannot be supposed to support the incumbent weight of water; and the true cause thereof must be this: The bottom and fides of the inverted glass-veffel being rigid, keep off the pressure of the air from the fluid above, whereas it hath liberty of access and freely acts thereon below: and that it does fo, will in part appear to an observer by the concavity of the paper underneath. Could the air's pressure in this case be any how admitted through the foot of the veffel inverted, without doubt the whole column would descend together. And the like would happen should the paper be removed; but for a different reason, viz. the large column of water in the mug, being composed of many collateral ones, which, being disposed as in a bundle, rest on the paper wherewith the vessel is covered, as on a common base; and these being all equally denfe, and equall fluid, are all retained, and continued of the fame length, by the general and uniform preffure of the air against the paper below; and fo long as this continues, none of them getting the least advantage over the rest, they are all sustained in a body compact together. But when the paper is removed, it being fearce possible to hold the vessel so exactly level, but that fome one or other of these fmaller fluid columns will become longer, confequently heavier, than those adjacent, and, over-balancing the reft, will descend, and give the lighter fluid, the air, leave to rife in its place, even to the top of the glass: the general pressure whereof being there admitted, will foon cause the rest of them to move, and the whole quantity will then defcend, feemingly together.

Again, should a vessel be but part filled with water, the same effect will follow to a certain degree. For instance, suppose we fill a long glass half with water, cover it with paper, and turn it down as before. Six inches suppose of water, endeavouring to descend, will by its weight rarefy the air in the glass above it, perhaps a 60th part or more. The denfer air without will then overpoise the air rarefied within; and there- matters as a standard,)

The figure of the fyphon may be varied at pleasure, fore a certain quantity of water, equal to the diffe- Hydraulics. rence of the two pressures, will in this case be thereby buoyed up and supported. But the air within the glass being dilated as aforesaid, the water suspended must be expected to hang fomething below the mouth of it; though not enough, perhaps, to overcome the tenacity of the water, and make it all de-

Upon the principle of the fyphon also we may easily Intermitaccount for intermitting or reciprocating springs. Letting springs AA be part of a hill, within which there is a cavity Plar BB; and from this cavity a vein or channel running fig. 2. in the direction of BCDE. The rain that falls upon the fide of the hill will fink and strain through the fmall pores and crannies G, G, G, G; and fill the cavity K with water. When the water rifes to the level HHC, the vein BCDE will be filled to C, and the water will run through CDF as through a fyphon; which running will continue until the cavity be emptied, and then it will flop until the cavity be filled again.

We have feen that fluids led in pipes will always rife to the level of the refervoir whence they are fupplied; the rifing column being pushed forward, and raifed by another equally heavy, at the same time endeavouring to descend. A like effect might be expected from jets of water thus impelled, did not fricJets-d'eau tion against the fides of the machines, and the refistance of the air, both lateral and perdendicular, generally prove an abatement, and prevent its rifing fo high as the head.

Where jets are executed in the best manner, and the friction spoken of is as much as possible removed. the impediment of the air only, through which they needs must beat in their rife, will cause them, according to experiment, to fall short of the height of the refervoirs, in the following proportions, viz.

JET.	RESERVOIR.
Feet.	Feet. Inches.

Whence in general it may be observed: That as often as a five-foot jet (to be taken in these Shall

Hydraulics.

Shall be contained in the height of any jet proposed; By so many inches multiplied into themselves, or squa-

The furface of the water in the refervatory which fup-

blies it, ought to exceed that jet in height.

Thus, to obtain a jet of 30 feet, which contains five feet fix times, the refervoir ought to be 36 inches or a yard higher; and a jet of 60 feet may be had from a head higher by four times that difference, 144 inches, or four yards. So that jets done in the best manner fall (bort of the heights of their refervatories, in a kind of fubduplicate ratio of the heights to which they rife.

This great disproportion in the rise of jets must in general be owing to the reliftance of the air they are made to move through; which has been shown to be in proportion to the squares of their celerities respectively: nor can the acceleration of the falling water in the pipe, or the retardment of the rifing stream by the action of gravity, be concerned at all in it; fince thefe are probably adequate, and counterbalance each other

every where in the fame level.

Their air's refistance being thus confiderable, it will always be found necessary to increase the borc of the adjutage or spouting-pipe with the height of the refervatory: for if it be too small, the rising stream will want fufficient weight and power to divide the air; which being denfest near the earth, a small stream of water, endeavouring to mount to a great height, will be dashed against it with fo great violence, as to fall away in a mist and be wholly lost. And it may be observed, that the weightier any body is, the greater force it will have when in motion : fince an ounce-ball fired from a musket, will go much farther, and do greater execution, than will an equal weight of shot; and these again may be projected farther than fo much lead rasped into powder and fired off. A charge of water fired from a piftol would fcarce wet a paper at the distance of fix feet. Accordingly, should a cask of water be any where pierced with holes of two, four, fix, eight, and twelve lines over, all in the fame level, the larger bore will always be found to throw the water fartheft.

It may be of use here to add Mr Marriote's propertions of the bores of the adjutages and pipes of conduct, who was very converfant in these things, and hath written very well on this fubject.

N. B. The French divide their inch into 12 equal parts, which they call lines.

P	,	
Heights of Refervoirs.		Diameter of the Pipe of Conduct.
FEET.	Lines.	Lines.

80	12, or 14	84, or 7
100	12, 14, or 15	96, or 8
Hence i	t mar he remarked	that those is a cout-

and fit proportion to be observed between the adjutage

whereby the jet is delivered, and the pipe conducting Hydraulic it from the head. In general, About five times the dia- Engines. meter of the adjutage for jets under half an inch, and fix or feven times for all above, will fize the pipes of conduct pretty well: not but it will always be an error on the right fide, to have them rather larger than in strictness they ought to be, that the jet may always be freely supplied with water, and in due time.

For a like reafon, if there be occasion for a cock to be placed in any part of the pipe of conduct, particular care must be taken that it should be there bigger in proportion, that the water-way may not be pinched; but that the cavity be left at least equal to the bore of

the rest of the pipe.

The bore of an adjutage cannot be too smooth or Those that are cylindrical are best; those that are bored conical worst, because of the reflections of the water from the inclined fides of the machine, which in the hurry of the iffuing stream will in them unavoidably be made.

When fluids are defigned to be raifed higher than the springs from whence they flow, forcing engines must be used; of which and other hydraulic machines.

we come now to give a particular account.

SECT. V. Hydraulic Engines.

THE pump is at once the most common and most Of pumps. useful of all the hydraulic instruments. It was first invented by Ctesebes, a mathematician of Alexandria, 120 B. C.; when the air's pressure came afterwards to be known, it was much improved, and it is now

brought to a great degree of persection.

Ctefebes's pump acted both by fuction and pullion; Plate and its fructure and action are as follow: —A brass cy-linder ABCD, furnished with a valve in L, is placed in fig. 15. the water. 2. In this is fitted the embulus MK, made of green wood, which will not fwell in the water, and adjusted to the aperture of the cylinder with a covering of leather, but without any valve. In H is fitted on another tube NH, with a valve that opens upwards in I. Now, the embulus EK being raifed, the water opens the valve in L, and rifes into the cavity of the cylinder:-and when the same embulus is again depreffed, the valve I is opened, and the water driven up through the tube HN. This is the pump ufed among the ancients, and that from which the others aftermentioned are deduced. Sir S. Morland has endeavoured to increase its force by lessening the friction : which he has done to good effect, infomuch as to make it work without almost any friction at all.

Of this pump as now used there are simply three kinds, viz. the fucking, the forcing, and the liftingpump. By the two laft, water may be raifed to any height, with an adequate apparatus and fufficient power: by the former it may, by the general pressure of the atmosphere on the furface of the well-water, be raifed no more than 33 feet, as was before hinted, though in practice it is feldom applied to the raifing it much above 28; because from the variations observed on the barometer, it is apprehended that the air may, on certain occasions, be fomething lighter than 33 feet of water; and whenever that shall happen, for want of the due counterpoife, this pump may fail in its per-

formance.

The

Hydraulic

mon pump, big as the bore of the pipe in that part wherein it works; and is leathered round, fo as to fit the bore exactly; and may be moved up and down, without fuffering any air to come between it and the pipe or pump-barrel.

forcing-pump by pictures of glass models, in which

ter K, the water being deep enough to rife at least as pipe, and make it run with a continued stream, high as from A to I. The valve a on the moveable So at every time the bucket is taifed, the bucket G, and the valve b on the fixed box H (which rifes, and the valve a falls; and at every time the bucbox quite fills the bore of the pipe or barrel at H), will ket is depressed, the valve b falls, and a rises. each lie close, by its own weight, upon the hole in the bucket and box, until the engine begins to work. The valves are made of brafs, and covered underneath with leather for closing the holes the more exactly: and the bucket G is railed and depressed alternately by the B before the working begins.

Take hold of the handle E, and thereby draw up the bucket from B to C, which will make room for the air in the pump all the way below the bucket to its force is not equivalent to the weight or pressure of the outward air upon the water in the veffel K: and therefore, at the first stroke, the outward air will press rarefied air in the pipe between e and C to the same the bucket. state it was in before; and then, as its spring within ward air, the water will rife no higher by the first stroke; and the valve b, which was raised a little by the dilation of the air in the pipe, will fall, and stop the hole in the box H; and the furface of the water will stand at e. Then depress the piston or bucket from C to B; and as the air in the part B cannot get back times as much strength to work it. again through the valve b, it will (as the bucket deagain left at liberty to fill a larger space; and so its in a narrow bore than in a wide one, because of the ipring being again weakened, the pressure of the out- greater velocity of the water. ward air on the water in the vessel K will force more

The common fucking-pump, with which we draw wa- barrel B; and as the water cannot be driven back Hydraulic Engines. ter out of wells, is an engine both pneumatic and by through the now close valve b, it will raife the valve a Engines. draulic. It confifts of a pipe open at both ends, in as the bucket defcends, and will be lifted up by the which is a moveable pifton, bucket, or fucker, as bucket when it is next raifed. And now, the whole space below the bucket being full, the water above it cannot fink when it is next depressed; but upon its depression, the valve a will rife to let the bucket go down; and when it is quite down, the valve a will fall by its weight, and ftop the hole in the bucket. When We shall explain the construction of this and the the bucket is next raised, all the water above it will be lifted up, and begin to run off by the pipe F. And both the action of the pittons and motion of the valves thus, by raifing and depreffing the bucket alternately, there is fill more water raifed by it; which getting Hold the model DCBL upright in the veffel of wa- above the pipe F, into the wide top I, will fupply the

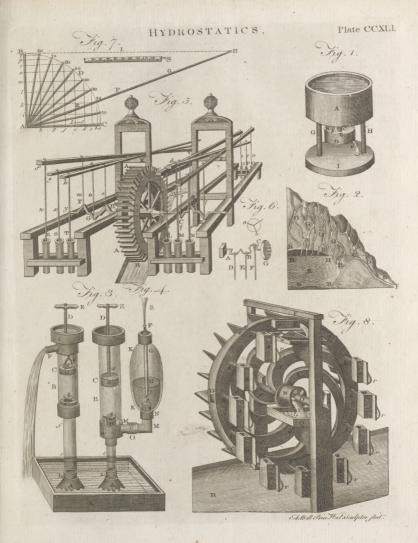

So at every time the bucket is raifed, the valve &

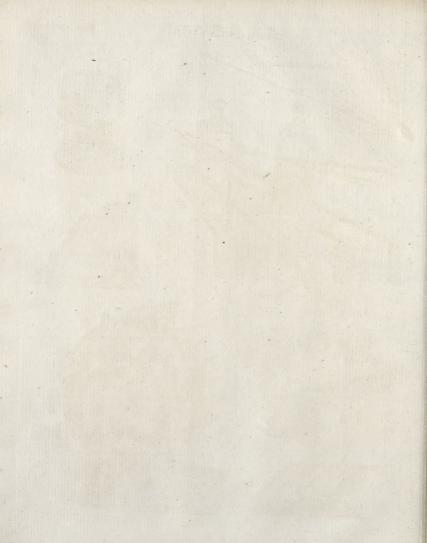

As it is the preffure of the air or atmosphere which causes the water to risc and follow the piston or bucket G as it is drawn up; and fince a column of water 33 feet high is of equal weight with as thick a column of the atmosphere from the earth to the very top of handle E and rod D d, the bucket being supposed at the air; therefore, the perpendicular height of the pifton or bucket from the surface of the water in the well must always be less than 33 feet; otherwise the water will never get above the bucket. But when the height is lefs, the pressure of the atmosphere will be greater dilate itself, by which its spring is weakened, and then than the weight of the water in the pump, and will therefore raife it above the bucket; and when the water has once got above the bucket, it may be lifted thereby to any height, if the rod D be made long up the water through the notched foot A, into the enough, and a fufficient degree of strength be emlower pipe, about as far as e: this will condense the ployed to raise it with the weight of the water above

The force required to work a pump, will be as the the pipe is equal to the force or preffure of the out- height to which the water is raifed, and as the square of the diameter of the pump bore in that part where the pilton works. So that, if two pumps be of equal heights, and one of them be twice as wide in the bore as the other, the widest will raise four times as much water as the narrowest; and will therefore require four

The wideness or narrowness of the nump, in any scends) raise the valve a, and so make its way through other part besides that in which the piston works, does the upper part of the barrel d into the open air. But not make the pump either more or less difficult to upon raifing the bucket G a fecond time, the air be- work, except what difference may arife from the frictween it and the water in the lower pipe at a will be tion of the water in the bore; which is always greater

The pump-rod is never raifed directly by fuch a water up into the lower pipe from e to f; and when handle as E at the top, but by means of a lever, whose the bucket is at its greatest height C, the lower valve longer arm (at the end of which the power is applied) b will fall, and stop the hole in the box H as before. generally exceeds the length of the shorter arm five or At the next stroke of the bucket or piston, the water fix times; and, by that means, it gives five or fix will rife through the box H towards B; and then the times as much advantage to the power. Upon these valve b, which was raifed by it, will fall when the principles, it will be easy to find the dimensions of a bucket G is at its greatest height. Upon depressing pump that shall work with a given force, and draw wathe bucket again, the water cannot be pushed back ter from any given depth. But as these calculations through the valve b, which keeps close upon the hole have been generally neglected by pump makers (either whilft the pifton descends. And upon raising the pifton for want of skill or industry), the following table was again, the outward preffure of the air will force the calculated by the late ingenious Mr Booth for their bewater up through H, where it will raife the valve, and nefit. In this calculation, he supposed the handle of follow the bucket to C. Upon the next depression of the pump to be a lever increasing the power five times; the bucket G, it will go down into the water in the and had often found that a man can work a pump four

The forcing-pump raises water through the box H Theforeing in the same maner as the sucking pump does, when the plunger or piston g is lifted up by the rod D d. But this plunger has no hole through it, to let the water in the barrel BC get above it, when it is depressed to B, and the valve b (which rose by the ascent of the water through the box H when the plunger g was drawn up) falls down and stops the hole in H, the moment that the plunger is raifed to its greatest height. Therefore, as the water between the plunger g and box H can neither get through the plunger upon its descent, nor back again into the lower part of the pump Le, but has a free passage by the cavity around H into the pipe MM, which opens into the air-vessel KK at P; the water is forced through the pipe MM by the defcent of the plunger, and driven into the air-veffel; and in running up through the pipe at P, it opens the valve a; which shuts at the moment the plunger begins to be raifed, because the action of the water against the under fide of the valve then ceases.

The water, being thus forced into the air-veffel KK by repeated strokes of the plunger, gets above the lower end of the pipe GHI, and then begins to condenfe the air in the veffel KK. For, as the pipe GH

Vos. IX. Part I.

Hydraulic inches diameter and 30 feet high, and discharge 27 is fixed air-tight into the vessel below F, and the air Hydraulic has no way to get out of the veffel but through the Engines mouth of the pipe at I, and cannot get out when the mouth I is covered with water, and is more and more condensed as the water rises upon the pipe, the air then begins to act forcibly by its fpring against the furface of the water at H: and this action drives the water up through the pipe IHGF, from whence it fpouts in a jet S to a great height; and is supplied by alternately raising and depressing of the plunger g. which conftantly forces the water that it raifes through the valve H, along the pipe MM, into the air-veffel

> The higher that the furface of the water H is raifed in the air-veffel, the lefs space will the air be condenfed into which before filled that veffel; and therefore the force of its fpring will be fo much the stronger upon the water, and will drive it with the greater force through the pipe at F: and as the fpring of the air continues whilft the plunger g is rifing, the stream or jet S will be uniform, as long as the action of the plunger continues; and when the valve b opens, to let the water follow the plunger npward, the valve a fauts, to hinder the water, which is forced into the air-veffel, from running back by the pipe MM into the barrel of the pump.

> If there was no air-veffel to this engine, the pipe GHI would be joined to the pipe MMN at P; and then the jet S would flop every time the plunger is raifed, and run only when the plunger is depreffed.

Of lifting-pumps there are feveral forts; the most The lifting common is thus constructed. AB is the barrel, fixed manner. in the frame KILM; which is also fixed immoveable, Plate with the lower part in the water that is to be pumped co up. GEQHO is a frame with two flrong iron rods, fig. 13moveable through holes in the upper and lower parts of the pump, IK and LM. In the bottom of this frame is fixed an inverted pifton BD, with its bucket and valve uppermoft at D. From the top of the barrel there goes off a part KH, either fixed to the barrel, or moveable by a ball and focket (as here represented at F); but in either case so very exact and tight, that no water or air can possiby get into the barrel, as that would prevent the effect of the pump. In this part, at C, is fixed a valve opening

When the pifton frame is thruft down into the water, the pifton D will descend, and the water beneath it rush up through the valve at D, and get above the pilton; where, upon the frame's being lifted up, the piston will force the water through the valve C, into the ciftern P, there to run off by the spout. It is to be remembered, that this fort of pump must be fet for far in the water, that the piston may play below its furface. It appears by the above defcription, that this is only a different manner of constructing a forcing-pump.

By means of forcing pumps, water may be raifed to any height above the level of a river or fpring; and machines may be contrived to work these pumps, either by a running stream, a fall of water, or by horses. An instance in each fort will be fufficient to show the method.

1. By a running fiream, or a fall of water. Let Plate AA be a wheel, turned by the fall of water BB; and CCXLL Hydraulic have any number of cranks (suppose fix) as C, D, E, Engines. F, G, H, on its axis, according to the strength of the

32 A pumpengine to mr.

fall of water, and the height to which the water is intended to be raifed by the engine. As the wheel turns round, these cranks move the levers, c, d, e, f, g, b, up and down, by the iron rods i, k, l, m, n, o; which alternately raife and depress the pistons by the other iron rods p, q, r, f, t, u, u, w, y, in 12 pumps; nine where-of, as L, M, N, O, P, Q, R, S, T, appear in the plate; the other three being hid behind the work at V. And as pipes may go from all these pumps, to convey the water (drawn up by them to a fmall height) into a close ciftern, from which the main pipe proceeds, the water will be forced into this ciftern by the descent of the pistons. And as each pipe, going from its respective pump into the cistern, has a valve at its end in the ciftern, these valves will hinder the return of the water by the pipes; and therefore, when the ciflern is once full, each pifton upon its descent will force the water (conveyed into the ciftern by a former ftroke) up the main pipe, to the height the engine was intended to raife it: which height depends upon the quantity raifed, and the power that turns the wheel. When the power upon the wheel is lessened by any defect of the quantity of water turning it, a proportionable number of the pumps may be laid afide, by difengaging their rods from the vibrating levers.

This figure is a representation of the engine erected at Blenheim for the duke of Marlborough, by the late ingenious Mr Aldersea. The water-wheel is 71 feet in diameter, according to Mr Switzer's account in his

Hydraulics.

When fuch a machine is placed in a stream that runs upon a small declivity, the motion of the levers and action of the pumps will be but flow; fince the wheel must go once round for each stroke of the pumps. But when there is a large body of flow running water, a cog or spur-wheel may be placed upon each fide of the water-wheel AA, upon its axis, to turn a trundle upon each fide; the cranks being upon the axis of the trundle. And by proportioning the cog-wheels to the trundles, the motion of the pumps may be made quicker, according to the quantity and ftrength of the water upon the first wheel; which may be as great as the workman pleafes, according to the length and breadth of the float-boards or wings of the wheel. In the fame manner the engine for raifing water at London-Bridge is constructed.

Plate CCXLII. £g. 7.

The wheels of the London-bridge water-works are placed under the arches of the bridge, and moved by the common stream of the tide-water of the river. A B the axle-tree of the water-wheel is nineteen feet long, and three feet in diameter; in which C, D, E, F are four fets of arms, eight in each place, on which are fixed G G G, four fets or rings of felloes twenty feet in diameter, and the floats H H H fourteen feet long, and eighteen inches deep, being about twenty-fix in number. The wheel lies with its two gudgeons, or centre pins, A, B, upon two braffes in the pieces M N, which are two great levers, whose fulcrum or prop is an arched piece of timber L; the levers being made circular on their lower fides to an arch of the radius M O, and kept in their places by two arching stude fixed in the stock L, through two mortoifes in the lever M N. The wheel is by thefe lewere made to rife and fall with the tide in the following

manner. The levers M N are fixteen feet long; from Hydraulic M the fulcrum of the lever to O the gudgeon of ingines. the water-wheel, fix feet; and from O to the arch at N, ten feet. To the bottom of the arch N is fixed a strong triple chain P, made after the fashion of a watch-chain, but the links arched to a circle of one foot diameter, having notches or teeth to take hold of the leaves of a pinion of cast iron Q, ten inches diameter, with eight teeth in it moving on an axis. The other loofe end of this chain has a large weight hanging at it to help to counterpoise the wheel, and preferve the chain from sliding on the pinion. On the fame axis is fixed a cog-wheel R, fix feet diameter, with forty-eight cogs. To this is applied a trundle, or pinion S of fix rounds or teeth; and upon the fame axis is fixed T, a cog-wheel of fifty-one cogs, into which the trundle V of fix rounds works, on whose axis is a winch or windlass W, by which one man with the two windlasses raises or lets down the wheel as there is occasion. And because the fulcrums of these levers MN are in the axis of the trundle K, viz. at M or X, in what fituation foever the wheel is raifed or let down, the cog-wheel I, I, is always equidiftant from M, and works or geers truly. By means of this machine the strength of an ordinary man will raise about fifty

ton weight.

I, I, is a cog-wheel fixed near the end of the greet axis eight feet diameter, and forty-four cogs working into a trundle K, of four feet and an half diameter, and twenty rounds, whose axis or spindle is. of cast iron four inches in diameter, lying in brasses at each end as at X. ZZ is a quadruple crank of cast iron, the metal being fix inches fquare, each of the necks being turned one foot from the centre, which is fixed in braffes at each end in two headflocks fastened down by caps. One end of this crank at Y is placed close abutting to the end of the axle-tree X, where they are at those ends fix inches diameter, each having a flit in the ends where an iron wedge is put one half into the end X, the other half into Y, by means of which the axis X turns about the crank ZZ. The four necks of the crank have each an iron fpear or rod fixed at their upper ends to the respective libra or lever, a 1, 2, 3, 4, within three feet at the end. Thefe levers are twenty-four feet long, moving on centres in the frame bbbb; at the end of which, at c 1, 2, 3, 4, are jointed four rods with their forcing plugs working into d 1, 2, '3, 4, four cast iron cylinders four feet three quarters long, fewen inches bore above and nine below where the valves lie, fastened by screwed stanches over the four holes of a hollow trunk of cast iron, har ving four valves in it just over eeee, at the joining on of the bottom of the barrels or cylinders, and at one end a fucking pipe and grate f going into the water, which fupplies all the four cylinders alternately.

From the lower part of the cylinders d 1, d 2, d 3, d 4, come out necks turning upward arch-wife, as gggg, whose upper parts are cast with flanches to ferew up to the trunk bbb; which neeks have bores of feven inches diameter, and holes in the trunk above communicating with them, at which joining are placed four valves. The trunk is call with four boffes or protuberances standing out against the valves to give room for their opening and shutting; and on the upper side are four holes stopped with plugs to take out on occafion to cleanse the valves. One end of this trunk is

ftopped

Marly.

Hydraulic stopped by a plug i. To the other iron pipes are joined of the stiff leather commonly used. Dr Desaguliers Hydraulic Engines. as i 2, by flanches, through which the water is forced

up to any height or place required.

Befides these four forcers there are four more placed at the other ends of the libræ, or levers (not shown here to avoid confusion, but to be seen on the left hand), the rods being fixed at a 1, 2, 3, 4, working in four fuch cylinders, with their parts dd, &c. ee, f, gg, and i, as before described, standing near kk.

At the other end of the wheel (at B) is placed all the same fort of work as at the end A is described, viz. The four levers ac, ac, &c. The cog-wheel I.

The trundle K. 8 forcing rods ad, ad, &c. The spindle X. 8 Cylinders de, de, &c. The crank Y, Z. 4 Trunks fuch as ee, bb. The fucking pipes f. 2 Forcing pipes as i. So that one fingle wheel works 16 pumps.

All which work could not be drawn in one perfpective view without making it very much confused.

Mr Beighton, who has described the structure and operation of this engine (fee Phil. Trans. abr. vol. vi. p. 358.) has calculated the quantity of water raifed by it in a given time. In the first arch next the city there is one wheel with double work of fixteen forcers; and in the third arch one wheel with double work at one end and fingle at the other, having twelve forcers; a fecond wheel in the middle having eight forcers, and a third wheel with fixteen: fo that there are in all fifty-two forcers; one revolution of a wheel produces in every forcer 2 trokes; fo that one turn of the four wheels makes 114 strokes. When the river acts with most advantage, the wheels go fix times round in a minute, and but 43 at middle water: hence the number of strokes in a minute is 684; and as the stroke is 21 feet in a feven-inch bore, it raises three ale gallons; and all raife per minute 2052 ale gallons; i. e. 123120 gallons=1954 hogheads per hour, and at the rate of 46896 hogsheads in a day, to the height of 120 feet. Such is the utmost quantity they can raise, fuppoling that there were no imperfections or loss at all; but Mr Beighton infers, from experiments performed on engines whose parts were large and excellently constructed, that they will lose one fifth and fometimes one fourth of the calculated quantity. For an estimate of the power by which the wheels are moved, see Phil. Trans. ubi supra.

Mr Beighton observes, that though these waterworks may justly be esteemed as good as any in Europe, yet fome things might be altered much for the better. If (he fays), inflead of fixteen forcers, they worked only eight, the stroke might be five feet in each forcer, which would draw much more water with the fame power in the wheel; because much water is lost by the two frequent opening and shutting of the valves: and that the bores that carry off the water from the forcers are too fmall; and that they should be near nine inches in diameter. This objection Dr Defaguliers fays is of no force, unless the velocity of the pistons was very great; but here the velocity of the water passing through the bores is much less than two feet in a second. This last writer observes, that a triple crank distributes the power better than a quadruple one. He adds, that forcers made with thin leather tanned, of about the thickness of the upper-leather of

has formed a comparison of the powers of this engine Engines. with those of the famous machine at MARLY. Estimating the quantity of water merely raifed by thefe machines, the former raifes almost twice and a quarter as much as the latter; but confidering that the London bridge water-works raife this water but 120 feet high, and that the Marly engine raifes its water 533 feet high, he deduces from a calculation formed on these different heights, and on the difference of the fall of water on both engines, this conclusion, viz. that the effect of the four wheels at London-bridge is three times greater than that of four of the wheels at

The engine at London-bridge was put up by Mr Sorocold towards the beginning of this century : the contrivance for raising and falling the water-wheel was the invention of Mr Hadley, who put up the first of that kind at Worcester, for which he obtained a pa-

ABCD is a wheel turned by water according to the A quadraorder of the letters. On the horizontal axis are four ple pumpfmall wheels, toothed almost half round; and the parts raising waof their edges on which there are no teeth are cut ter. down fo as to be even with the bottoms of the teeth Plate where they fland.

The teeth of these four wheels take alternately into the teeth of four racks, which hang by two chains over the pullies Q and L; and to the lower ends of these racks there are four iron rods fixed, which go down into the four forcing-pumps, S, R, M, and N. And, as the wheels turn, the racks and pump-rods are

alternately moved up and down.

Thus suppose the wheel G has pulled down the rack I, and drawn up the rack K by the chain: as the last tooth of G just leaves the uppermost tooth of I, the first tooth of H is ready to take into the lowermost tooth of the rack K, and pull it down as far as the teeth go; and then the rack I is pulled upward thro' the whole space of its teeth, and the wheel G is ready to take hold of it, and pull it down again, and for draw up the other .- In the fame manner, the wheels E and F work the racks O and P.

Thefe four wheels are fixed on the axle of the great wheel in fuch a manner, with respect to the positions of their teeth, that, whilft they continue turning round. there is never one instant of time in which one or other of the pump-rods is not going down and forcing the water. So that, in this engine, there is no occasion for having a general air-veffel to all the pumps, to procure a constant stream of water slowing from the up-

per end of the main pipe. From each of these pumps, near the lowest end, in the water, there goes off a pipe, with a valve on its farthest end from the pump; and these ends of the pipes all enter one close box, into which they deliver the water: and into this box the lower end of the main conduct-pipe is fixed. So that, as the water is forced or pushed into the box, it is also pushed up the main pipe to the height that it is intended to

2. Where a stream or fall of water cannot be had, engine to and gentlemen want to have water raised, and brought go by to their houses from a rivulet or spring; this may be horses. a countryman's shoe, would be much better than those effected by a horse-engine, working three forcingpumps,

CCXLL. \$5. 6.

Hydraulic pumps which fland in a refervoir filled by the fpring or rivulet: the pistons being moved up and down in the pumps by means of a triple crank ABC, which, as it is turned round by the trundle G, raifes and depresses the rods D, E, F. If the wheel has three times as many cogs as the trundle has flaves or rounds, the trundle and cranks will make three revolutions for every one of the wheel: and as each crank will fetch a flroke in the time it goes round, the three cranks will make nine strokes for every turn of the great wheel.

The cranks should be made of cast iron, because that will not bend; and they should each make an angle of 120 with both of the others, as at a, b, c; which is (as it were) a view of their radii in looking endwife at the axis: and then there will be always one or other of them going downward, which will push the water forward with a continued ffream into the main pipe. For when b is almost at its lowest situation, and is therefore just beginning to lose its action upon the pifton which it moves, c is beginning to move downward, which will by its pifton continue the propelling force upon the water: and when c is come down to the position of b, a will be in the position

The more perpendicularly the pifton rods move up

and down in the pumps, the freer and better will their ftrokes be: but a little deviation from the perpendicular will not be material. Therefore, when the pumprods D, E, and F, go down into a deep well, they may be moved directly by the cranks, as is done in a very good horse-engine of this fort at the late Sir James Creed's at Greenwich, which forces up water about 64 feet from a well under ground, to a refervoir on the top of his house. But when the cranks are only at a small height above the pumps, the pistons

must be moved by vibrating levers, as in the above engine at Blenheim: and the longer the levers are, the nearer will the strokes be to a perpendicular. Let us suppose, that in such an engine as Sir James

A calcula- Creed's, the great wheel is 12 feet diameter, the tion of the trundle 4 feet, and the radius or length of each crank quantity of q inches, working a piston in its pump. Let there be may be rai-three pumps in all, and the bore of each pump be four inches diameter. Then, if the great wheel has three horse en- times as many cogs as the trundle has staves, the trundle and cranks will go three times round for each revolution of the horfes and wheel, and the three cranks will make nine strokes of the pumps in that time, each stroke being 18 inches (or double the length of the crank) in a four inch bore. Let the diameter of the horfe-walk be 18 feet, and the perpendicular height to which the water is raifed above the furface of the well be 64 feet.

If the horses go at the rate of two miles an hour (which is very moderate, walking) they will turn the great wheel 187 times round in an hour.

In each turn of the wheel the piftons make nine Arokes in the pumps, which amount to 1683 in an

Each stroke raises a column of water 18 inches long and four inches thick, in the pump-barrels; which column, upon the descent of the piston, is forced into the main pipe, whose perpendicular altitude above the furface of the well is 64 feet.

Now, fince a column of water 18 inches long, and Hydraulic 4 inches thick, contains 226.18 cubic inches, this Engines. number multiplied by 1683 (the strokes in an hour) gives 380661 for the number of cubic inches of water raifed in an hour.

A gallon, in wine-measure, contains 231 cubic inches, by which divide 380661, and it quotes 1468 in round numbers, for the number of gallons raifed in an hour; which, divided by 63, gives 261 hogsheads. If the horses go fatter, the quantity raised will be so much the greater.

In this calculation it is supposed that no water is wasted by the engine. But as no forcing engine can be supposed to lose less than a fifth part of the calculated quantity of water, between the piltons and barrels, and by the opening and shutting of the valves, the borses ought to walk almost 21 miles per hour to fetch up this lofs.

A column of water 4 inches thick and 64 feet high, weighs 349 pounds avoirdupois, or 424 pounds troy; and this weight, together with the friction of the engine, is the refittance that must be overcome by the strength of the horses.

The horfe-tackle should be fo contrived, that the horfes may rather push on than drag the levers after them. For, if they draw, in going round the walk, the outfide leather fraps will rub against their fides and hams; which will hinder them from drawing at right angles to the levers, and fo make them pull at a. difadvantage. But if they push the levers before their breafts, instead of dragging them, they can always walk at right angles to thefe levers.

It is no ways material what the diameter of the main or conduct pipe be : for the whole reliftance of the water therein against the horses will be according to the height to which it is raifed, and the diameter of that part of the pump in which the pifton works, as we have already observed. So that by the same pump, an equal quantity of water may be raifed in (and confequently made to run from) a pipe of a foot diameter, with the fame eafe as in a pipe of five or fix inches: or rather with more eafe, because its velocity in a large pipe will be lefs than in a finall one, and therefore its friction against the fides of the pipe will be

And the force required to raife water depends not upon the length of the pipe, but upon the perpendicular height to which it is raifed therein above the le- Plate vel of the fpring. So that the same force which CCXLI, would raife water to the height AB in the upright fig. 7. plpe Aiklmnopq B, will raife it to the fame height or level BIH in the oblique pipe AEFGH. For the pressure of the water at the end A of the latter is no more than its preffure against the end A of the

The weight or preffure of water at the lower end of the pipe, is always as the fine of the angle to which the pipe is clevated above the level parallel to the horizon. For although the water in the upright pipe AB would require a force applied immediately to the lower end A equal to the weight of all the water in it, to support the water, and a little more to drive it up and out of the pipe; yet, if that pipe be inclined from its upright polition to an angle of 80 degrees (as in A 80), the force required to support or to

Engines.

Hydraulic raife the same cylinder of water will then be as much Engines. less as the fine 80 h is less than the radius AB; or as the fine of 80 degrees is less than the fine of 90. And fo, decreasing as the fine of the angle of elevation leffens, until it arrives at its level AC or place of reft, where the force of the water is nothing at either end of the pipe. For although the absolute weight of the water is the same in all positions, yet its pressure at the lower end decreases as the fine of the angle of elevation decreases; as will appear plainly by a farther confideration of the figure.

Let two pipes AB and AC, of equal lengths and bores, join each other at A; and let the pipe AB be divided into 100 equal parts, as the fcale S is; whose length is equal to the length of the pipe .-Upon this length, as a radius, describe the quadrant BDC, and divide it into 90 equal parts or degrees.

Let the pipe AC be elevated to to degrees upon the quadrant, and filled with water: then, part of the water that is in it will rife in the pipe AB; and if it be kept full of water, it will raise the water in the pipe AB from A to i; that is, to a level i 10 with the mouth of the pipe at 10: and the upright line a 10, equal to A e, will be the fine of 10 degrees elevation; which being meafured upon the feale S, will be about 17.4 of fuch parts as the pipe contains 100 in length : and therefore, the force or pressure of the water at A, in the pipe A 10, will be to the force or pressure at A in the pipe AB, as 17.3 to 100.

Let the same pipe be elevated to 20 degrees in the quadrant; and if it be kept full of water, part of that water will run into the pipe AB, and rife therein to the height A k, which is equal to the length of the upright line b 20, or to the fine of 20 degrees elevation; which, being measured upon the scale S, will be 34.2 of fuch parts as the pipe contains 100 in length. And therefore, the pressure of the water at A, in the full pipe A 20, will be to its preffure, if that pipe were raifed to the perpendicular fituation AB, as 34.2 \$0 100.

Elevate the pipe to the position A 30 on the quadrant, and if it be supplied with water, the water will rife from it, into the pipe AB, to the height A /, or to the same level with the mouth of the pipe at 30. The fine of this elevation, or of the angle of 30 degrees, is c 30; which is just equal to half the length of the pipe, or to 50 of fuch parts of the scale as the length of the pipe contains 100. Therefore, the preffure of the water at A, in a pipe elevated 30 degrees above the horizontal level, will be equal to one half of what it would be if the fame pipe flood upright

in the fituation AB And thus, by elevating the pipe to 40, 50, 60, 70, and 80 degrees on the quadrant, the fines of thefe elevations will be d 40, ϵ 50, f 60, g 70, and h 80; which will be equal to the heights Am, An, Ao, Ap, and Aq: and these heights measured upon the feale S will be 64.3, 76.6, 86.6. 94.0, and 98.5; which express the preffures at A in all these elevations, confidering the pressure in the upright pipe AB

28-100.

1 30 1	500	60	866	00	1000

Because it may be of use to have the lengths of all: the fines of a quadrant from o degrees to 90, we have given the foregoing Table, showing the length of the fine of every degree in fuch parts as the whole pipe (equal to the radius of the quadrant) contains 1000. Then the fines will be integral or whole parts in length. But if you suppose the length of the pipe to be divided only into 100 equal parts, the last figure of each part or fine must be cut off as a decimal; and then those which remain at the left hand of this separation will be integral or whole parts.

Thus, if the radius of the quadrant (supposed to be equal to the length of the pipe AC) be divided into 1000 equal parts, and the elevation be 45 degrees, the fine of that elevation will be equal to 707 of these parts: but if the radius be divided only into 100 equal parts, the fame fine will be only 70.7 or 7070 of these parts. For, as 1000 is to 707, so is 100 to 70.7.

As it is of great importance to all engine-makers, to know what quantity and weight of water will be contained in an upright round pipe of a given diameter and height; fo as, by knowing what weight is to be raifed, they may proportion their engines to the force which they can afford to work them; we shall subjoin Tables showing the number of cubic inches of water contained in an upright pipe of a round bore, of any diameter from one inch to fix and a half, and of any height from one foot to two hundred: together with the weight of the faid number of cubic inches, both

Hydroftatic in troy and avoirdupois ounces. The number of cu-Tables, bic inches divided by 231, will reduce the water to

gallons in wine-measure; and, divided by 282, will reduce it to the measure of ale-gallons. Also, the troy ounces divided by 12, will reduce the weight to troy pounds; and the avoirdupois ounces divided by 16, will reduce the weight to avoirdupois pounds.

And here we must repeat it again, that the weight or pressure of the water acting against the power that works the engine, must always be estimated according to the perpendicular height to which it is to be raifed, without any regard to the length of the conduct-pipe, when it has an oblique position, and as if the diameter of that pipe were just eqal to the diameter of that part of the pump in which the pifton works. Thus, by the following Tables, the preffure of the water, against an engine whose pump is of a 41 inch bore, and the perpendicular height of the water in the conduct-pipe is 80 feet, will be equal to 8057.5 troy ounces, and to 8848.2 avoirdupois ounces; which makes 671.4 troy pounds, and 553 avoirdupois.

Example. Required the number of cubic inches, and the weight of the water, in an upright pipe 278 feet high, and I inch diameter.

Feet.	Cubic inches.	Troy oz.	Avoir. oz.
200	4241.1	2238.2	2457.8

8	169.6	89.5	98.3
-	Service Sales Works		\$1000 trans.
Anfw. 278	5895.1	3111.0	3416.3

Here the nearest fingle decimal figure is only taken into the account; and the whole being reduced by division, amounts to 25 wine-gallons in measure; to 2594 pounds troy, and to 2131 pounds avoirdupois.

These tables were at first calculated to fix decimal places for the fake of exactness: but in transcribing them there are no more than two decimal figures taken into the account, and fometimes but one; because there is no necessity for computing to hundredth-parts of an inch or of an ounce in practice.

Under the article STRAM-Engine, the reader will find Hydraulic a particular account of that useful invention, with a Engines correct description and plate of it in its improved flate.

The multiplying machine, has no dependence on the strandaction of the atmosphere; but, by the weight of war-engarter only, and without pump-work of any kind, raifes water fufficient to ferve a gendleman's feat, with an overplus for fountains, filt-ponds, &c. err by a

AB are two copper pans or buckets of unequal multinlying weight and fize, fulpended to chains, which alternately wheel wind off and on the multiplying-wheel YZ; whereof Plate the wheel Y is smaller in diameter, and Z larger, in fig. 6. proportion to the different lifts each is defigned to perform.

When the buckets are empty, they are stopped level with the spring at X, whence they are both filled with water in the same time.

The greater of the two, A, being the heavier when full, preponderates and defeends ten feet, perhaps from C to D; and the leffer, B, depending on the fame axis, is thereby weighed up or raifed from E to F, fuppofe 30 feet.

Here, by particular little contrivances, opening the valves placed at bottom of each of these buckets, they both discharge their water in the same time, through apertures proportionable to their capacities; the fmaller into the ciftern W, whence it is conveyed for fervice by the pipe T, and the larger at D, to run waste by the drain below at H. The bucket B being empty, is fo adjusted as then to overweigh; and descending fleadily as it rose betwixt the guiding rods VV, brings or weighs up A to its former level at X, where both being again replenished from the spring, they thence proceed as before. And thus will they continue conflantly moving (merely by their circumflantial difference of water-weight, and without any other affiftance than that of fometimes giving the iron-work a little oil) fo long as the materials shall last, or the spring fupply water.

The steadiness of the motion is in part regulated by a worm turning a jack-fly, and a little fimple wheelwork at LM; which communicating with the multiplying wheel axle at M, is thereby moved forward or backward as the buckets either rife or descend. But what principally keeps the whole movement fleady, is the equilibrium preferved in the whole operation by a certain weight of lead, at the end of a lever of fit length, and fixed on one of the spindles of the wheelwork, the numbers whereof are fo calculated as, during the whole performance up and down, to let it move no more than one-fourth of a circle, from G to K; by which contrivance, as more or less of the chains suspending the buckets come to be wound off their respective wheels Y and Z, this weight gradually falls in as a counterbalance, and fo continues the motion equable and easy in all its parts.

The water wafted by this machine is not above the hundredth part of what a water-wheel will expend, to raife an equal quantity. But where a fall, proportionable to the intended rife of water, cannot be had, with a convenient fewer to carry off the wafte water over and above, this device cannot be well put in practice.

WATER may also be raised by means of a stream AB The Perturning a wheel CDE, according to the order of the san wheel.

Plate CCXLI fig. 8.

Hydraulic letters, with buckets a, a, a, a, &c hung upon the wheel by strong pins b, b, b, b, &c. fixed in the fide of the rim: but the wheel must be made as high as the water is intended to be raifed above the level of that part of the fream in which the wheel is placed. As the wheel turns, the buckets on the right hand go down into the water, and are thereby filled, and go up full on the left hand, until they come to the top at K, where they firike against the end n of the fixed trough M, and are thereby overfet, and empty the water into the trough; from which it may be conveyed in pipes to the place which it is designed for : and as each bucket gets over the trough, it falls into a perpendicular position again, and goes down empty, until it comes to the water at A, where it is filled as before. On each bucket is a fpring r, which, going over the top or crown of the bar m, (fixed to the trough M), raifes the bottom of the bucket above the level of its mouth, and fo causes it to empty all its water into the

> Sometimes this wheel is made to raife water no higher than its axis; and then, instead of buckets hung upon it, its fpokes, C, d, e, f, g, h, are made of a bent form, and hollow within; these hollows opening into the holes C, D, E, F, in the outfide of the wheel, and also into those at O in the box Nupon the axis. So that as the holes CD, &c. dip into the water, it runs into them; and as the wheel turns, the water rifes in the hollow spokes cd, &c. and runs out in a stream P from the holes at O, and falls into the trough Q, from whence it is conveyed by pipes. And this is a very eafy way of raifing water, because

the engine requires neither men nor horfes to turn it. ENGINES for extinguishing fire are either forcing or lifting pumps; and being made to raife water with great velocity, their execution in great measure depends upon the length of their levers, and the force

Plate CCXLIL wherewith they are wrought.

For example, AB is the common fquirting fireengine. D C is the frame of a lifting-pump, wrought by the levers E and F acting always together During the stroke, the quantity of water raised by the pifton N spouts with force through the pipe G, made capable of any degree of elevation by means of the yielding leather-pipe H, or by a ball and focket, capable of turning every way, fcrewed on the top of the pump. Between the firokes on this machine the ftream is discontinued. The engine is supplied by water poured in with buckets above; the dirt and filth whereof are kept from choaking the pump work by help of the strainer IK.

a confiderable improvement has fince been made to thefe machines, in order to keep them discharging a continual stream. In doing whereof it is not to be understood that they really throw out more water than do the fquirting ones of the fame fize and dimensions with themselves; but that the velocity of the water. and of course the friction of all the parts, being less violent, the stream is more even and manageable, and may be directed hither or thither with greater eafe and certainty than if it came forth only by fits and flarts: The machine, thus improved, is therefore generally better adapted to the purpose intended than the former, especially in the beginning of these calamitous accidents.

The stream is made continual from the spring of air Hydraulic confined in a strong metal vessel CC, in the fire engine Engines. AB, fixed between the two forcing pumps D and E, Plats wrought with a common double lever FG moving on CCLXII. the centre H. The piftons in D and E both fuck and fig. 6. force alternately, and are here represented in their different actions; as are also the respective valves at IK

The water to fupply this engine, if there be no opportunity of putting the end of a fucking-pipe, occafionally to be ferewed on, into a most or canal, which would spare much hurry and labour in case of fire, is also poured into the vessel AB; and being ftrained through the wire grate N, is, by the pressure of the atmosphere, raifed through the valves K and M into the barrels of D or E, when either of their forcers afcend; whence again it will be powerfully pushed when they descend into the air-vessel CC, through the valves I and L by turns: by the force whereof the common air between the water and the top of the airveffel O will from time to time be forcibly crowded into less room, and much compressed; and the air being a body naturally endowed with a strong and lively fpring, and always endeavouring to dilate itself every way alike in fuch a circumstance, bears strongly both against the sides of the vessel wherein it is consined, and the furface of the water thus injected; and fo makes a constant regular stream to rife through the metal pipe P into the leather one Q, forewed thereon; which being flexible, may be led about into rooms and entries, as the cafe may require.

Should the air contained in this veffel be compreffed into half the space it took up in its natural state, the fpring thereof will be much about doubled; and as before it equalled and was able to fuftain the preffure of a fingle atmosphere, it having now a double force, by the power of that fpring alone will throw water into air, of the common degree of denfity, about thirty feet high. And should this compressure be still augmented, and the quantity of air which at first filled the whole veffel be reduced into one-third of that space, its spring will be then able to resist, and confequently to raife the weight of a treble atmosphere; in which case, it will throw up a jet of water fixty feet high. And should so much water again be forced into the veffel as to fill three parts of the capacity, it will be able to throw it up about ninety feet high; and wherever the fervice shall require a still greater rife of water, more water must be thrust into this veffel; and the air therein being thus driven by main force into a still narrower compass, at each explosion, the gradual restitution thereof to its first dimensions is what regularly carries on the stream between the strokes, and renders it continual during the operation

of the machine. This experiment, in little, may be either made on the lifting or forcing pump, the nofels of which may be left large, on purpose for the reception of the small pipe F, reaching nearly to the valve at E, and occafionally to be screwed in. Between this pipe and the fides and top of the nofel H, a quantity of air will necessarily be lodged, which, when the forcer acts, will be compressed at every stroke by the rife of the water; more whereof will be pushed through E than can immediately get away, through the pipe F, which

Fire-en gines.

fig. 5.

Hydraulic is to be always less in diameter than the opening of Engines. the valve at E: the degree of which condensation, and that of the restitution to its natural state of denfity, may be observed through the glass machines, to

The fcrew medes. CCLXIII. 6g. 1.

ARCHIMEDES'S SCREW is a fort of spiral pump, and receives its name from its inventor. It confifts of a long cylinder AB with a hollow pipe CD round it; and is placed in an oblique position, with the lower end in the water, the other end being joined to the lower end of the winch IK, supported by the upright piece IR.

When this fcrew is immerfed in the water, it immediately rifes in the pipe by the orifice C to a level with the furface of the water EF; and if the point in the fpiral, which in the beginning of the motion is coincident with the furface of the water, happen not to be on the lower fide of the cylinder, the water, upon the motion of the ferew, will move on in the spiral till it come to the point on the other fide that is coincident with the water. When it arrives at that point, which we will suppose to be O, it cannot afterwards possess any other part of the spiral than that on the lowest part of the cylinder: for it cannot move from O toward H or G, because they are higher above the horizon; and as this will be conflantly the case after the water in the foiral has attained the point O, it is plain it must always be on the under fide of the cylinder.

But because the cylinder is in constant motion, every part of the spiral screw, from O to D, will by degrees succeed to the under part of the cylinder. The water therefore must fucceed to every part of it, from O to D, as it comes on the lower fide; that is, it must afcend on the lower part of the cylinder through all the length of the pipe, till it come to the orifice at D, where it must run out, having nothing further to

fupport it. THERE is a fimple and eafy method of working two pumps at once, by means of the balance AB, having a large iron ball at each end, and placed in equilibrium on the two fpindles C, as represented in the 6th figure. On the right and left are two boards I, nailed to two cross pieces, fastened to the axis of the machine. On these boards the person who is to work the pump stands, and supports himself by a cross piece nailed to the two posts ED, fig. 5. At the distance of ten inches on each fide the axis are fastened the

The man, by leaning alternately on his right and left foot, puts the balance in motion, by which the pumps OP are worked, and the water thrown into the pipe H, and carried to a height proportional to the diameter of the valves and the force of the balance. There must be placed on each side an iron spring, as F and G, to return the balance, and prevent its ac-

quiring too great velocity. THE Chain-pump, A B, is ordinarily made from twelve to twenty-four feet long; and confifts of two collateral fquare barrels, and a chain of piltons of the fame form, fixed at proper diffances thereon. chain is moved in these round a coarse kind of wheelwork at either end of the machine, the teeth whereof are fo made as to receive one half of the flat piltons, and let them fold in ; and they take hold of the links as they rife in one of the barrels, and return by the other. The machine is wrought either by the turning

of one handle or two, according to the labour requi- Entertainred, depending on the height to which the water is to ing experibe raised. A whole row of the pistons (which go " free of the fides of the barrel by perhaps a quarter of an inch) are always lifting when the pump is at work; yet do they, by the general push in the ordinary way of working, as it is pretty brifk, commonly bring up a full bore of water in the pump. This machine is fo contrived, that, by the continual folding in of the piftons, flones, dirt, and whatever happens to come in the way, may also be cleared; and therefore it is generally made use of to drain ponds, to empty fewers, and remove foul waters, in which no other pump could work.

THE last machine to be described consists of five The hy. pieces of board, forming a fort of fcoop, as B. The draulic fcoop. handle C is suspended by a rope fastened to three poles, plate placed in a triangle, and tied together at A.

The working of this machine confifts entirely in fig. 2. balancing the scoop that contains the water, and directing it in fuch manner that the water may be thrown in any given direction. It is evident that the operation of this machine is fo very eafy, that it may rather be confidered as an agreeable and falutary recreation than hard labour.

With this machine a man of moderate flrength, by two strokes in four feconds, can draw half a cubic foot of water, that is, more than four hundred cubic feet

This machine is frequently used by the Dutch in emptying the water from their dikes.

SECT. VI. Entertaining Experiments.

1. Several amusing appearances may be produced of the fyby difguifing or diverlifying a fyphon. It may, for guifed, example, be difguifed in a cup, from which no liquor Tantalus's will flow till the fluid is raifed therein to a certain cup, &c. height; but when the efflux is once begun, it will continue till the veffel is emptied. Thus, fig. 11. is a Plate cup, in the centre whereof is fixed a glass pipe A, continued through the bottom at B, over which is put another glass tube, made air-tight at top by means of the cork at C; but left fo open at foot, by holes made at D, that the water may freely rife between the tubes as the cup is filled. Till the fluid in the cup shall have gained the top of the inmost pipe at A, no motion will appear. The air however from between the two pipes being in the mean time extruded, by the rife of the denfer fluid, and passing down the inner tube, will get away at bottom; and the water, as foon as the top of the inclosed tube shall be covered thereby, will very foon follow, and continue to rife in this machine, as in the fyphon, till the whole is run off

This is called by fome, a Tantalus's cup; and, to humour the thought, a hollow figure is foinetimes put over the inner tube, of fuch a length, that when the fluid is got nearly up to the lips of the man, the fyphon

may begin to act and empty the cup.

This is in effect no other than if the two legs of the fyphon were both within the veffel, as in fig. 12. into which the water poured will rife in the shorter leg of the machine, by its natural preffure upwards, to its own level; and when it shall have gained the bend of the fyphon, it will come away by the longer leg, as

The bafig 3, 4.

pump. fig. 4.

Entertain- already described. An apple, an orange, or any other ing experi- folid, may be put into the veffel, to raife the water, when it is near the bend, to fet it a-running, by way of amusement.

Plate

Again, let the handle of the cup, fig. 11. be hol-CCXLIII. low: let the tube CD, screwed therein, communicate ficely with the water poured into the cup, that it may rife equally in both. Being once above the level ED, it will overflow, and descending through the cavity DB, will empty the cup of its liquor.

The fountain at command. Plate CCXLL fig. 1.

fyphon.

2. The device called the fountain at command, acts upon the same principle with the fyphon in the cup. Let two veffels A and B be joined together by the pipe C, which opens into them both. Let A be opened at top, B close both at top and bottom (fave only a small hole at b to let the air get out of the vessel B), and A he of such a fize as to hold about six times as much water as B. Let a fyphon DEF be foldered to the veffel D, fo that the part DEe may be within the veffel, and F without it; the end D almost touching the bottom of the veffel, and the end F below the level of D: the veffel B hanging to A by the pipe C (foldered into both), and the whole supported by the pillars G and H upon the stand I. The bore of the pipe must be considerably less than the bore of the

The whole being thus conftructed, let the veffel A be filled with water, which will run through the pipe C, and fill the veffel B. When B is filled above the top of the fuphon at E, the water will run through the fyphon, and be discharged at F. But as the bore of the fyphon is larger than the bore of the pipe, the fyphon will run fatter than the pipe, and will foon empty the veffel B; upon which the water will ceafe from running through the fyphon at F, until the pipe C refills the veffel B, and then it will begin to run as before. And thus the fyphon will continue to run and stop alternately, until all the water in the vessel A has one may eafily guess about what time the fyphon will stop, and when it will begin to run; and then, to amuse others, he may call out, " flop," or " run," accordingly.

Portable fountain and clepfydra. CCXLIII fig. 7.

3. This figure represents a very pretty portable foun--tain, which, being charged with water, and inverted, will play a jet nearly as high as the refervoir, till the fluid is exhaufted; and then turned up on the other end, the fame thing will happen, and a real clepfydra, or water-clock, be thereby formed.

This device confifts of two hollow veffels, A and B, communicating with each other only by the recurved tubes C and D; at the ends of which, E and F, are placed fmall adjutages to direct the jet. G and H are two open tubes, foldered into the bottom of the basons belonging to A and B, through which the water flows in, and fills those veifels to a certain height, that is, according to their length. They by their disposition also prevent the return of the water the same way, when the machine is turned upfide down.

4. Provide a cylindric veffel of glass or china, ABCD, about a foot high, and four inches diameter. Make a hole in its bottom, in which glue a small glass-tube E, of about one-third of an inch diameter, and whose end has been partly closed in the flame of a lamp, fo that it will not fuffer the water to pals out but by

drops, and that very flowly. Cover the top of the vef. Entertainfel with a circle of wood F, in the centre of which ing experimake a round hole about half an inch diameter.

Have a glass tube GH, a foot high, and a quarter of an inch diameter; and at one end let it have a small glass globe I, to which you may hang a weight L, by which it is kept in equilibrio, on or near the furface of the water; or you may pour a fmall quantity of mercury into the tube, for the same purpose. Fill the veffel with water; put the tube in it, and over it place the cover F, through the hole of which the tube must pass freely up and down. Now, as the water drops gradually out of the veffel, the tube will continue to descend till it come to the bottom.

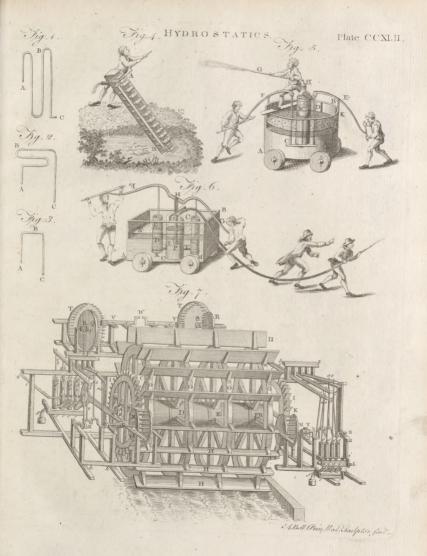

Therefore, paste on the tube a graduated paper, and put it in the veffel when nearly full of water. Hang a watch by it, fet to a certain hour; and as the tube descends, mark the hours, with the half and quarter hours. If the veffel be fufficiently large, with regard to the hole at the bottom, it will go for 12 hours, a day, or as much longer as you pleafe, and requires no other trouble than that of pouring in water to a certain height. Care must be had, however, that the water be clean; for if there be any fediment, it will in time flop the fmall hole at bottom, or at least render the motion of the water irregular.

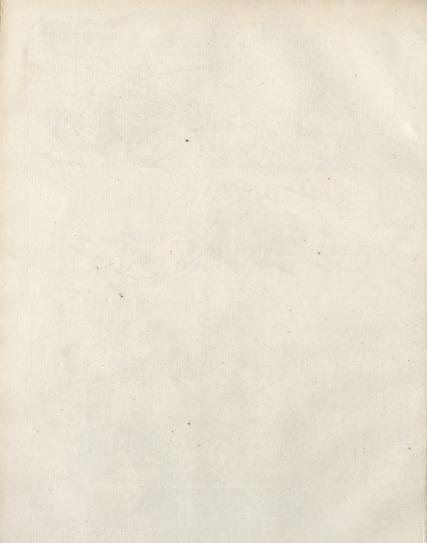

The veffel may be of tin, but the pipe at bottom fhould be glass, that its small aperture may not alter by use. It is to be observed, that the tube of one of these clocks is not to be graduated by another: for though the veffel be of the same diameter at top, it may not be perfectly cylindrical throughout; nor is it easy to make the hole at the bottom of one veffel exactly of the fame dimension with that of another.

5. The Hon. Mr Charles Hamilton has described Clepfydras a curious clepfydra or water-clock of new conftruc- fig. 7-

tion. An open canal ee, supplied with a constant and equal fiream by the fyphon d, has at each end run through the pipe C .- So that, after a few trials, ff, open pipes of exactly equal bores, which deliver the water that runs along the canal e, alternately into the veffels g 1, g 2, in fuch a quantity as to raife the water from the mouth of the tantalus t, exactly inan hour. The canal ee is equally poifed by the two pipes f 1, f 2, upon a centre r, the ends of the canal e are raifed alternately, as the cups z z are depreffed, to which they are connected by lines running over the pullies / l. The cups z z are fixed at each end of the balance m m, which moves up and down upon its centre v. n 1, n 2, Are the edges of two wheels or pullies, moving different ways alternately, and fitted to the cylinder o by oblique teeth both in the cavity of the wheel and upon the cylinder, which, when the wheel n moves one way, that is, in the direction of the minute hand, meet the teeth of the cylinder and carry the cylinder with it, and, when n moves the contrary way, flip over those of the cylinder, the teeth not meeting, but receding from each other. One or other of these wheels n n continually moves o in the same direction, with an equable and uninterrupted motion. A fine chain goes twice round each wheel, having at one end a weight a, always out of water, which equiponderates with y at the other end, when kept floating on the furface of the water in the veffel g, which y must always be; the two cups z, z, one at each end of the balance, keep it in equilibrio, till one of them is forced

Hyerefcope, or water clock. CCXLIV. fig. 4

ments

Entertain- down by the weight and impulse of the water, which ing experi- it receives from the tantalus tti: each of these cups z, z, has likewise a tantalus of its own b, b, which empties it after the water has done running from g, and leaves the two cups again in equilibrio: q is a drain to carry off the water. The dial-plate, &c. needs no description. The motion of the clepsydra is effected thus: As the end of the canal ee, fixed to the pipe f 1, is, in the figure, the lowest, all the water supplied by the typhon runs through the pipe f 1, into the veffel g 1, till it runs over the top of the tantalus t; when it immediately runs out at i into the cup z, at the end of the balance m, and forces it down; the balance moving on its centre v. When one fide of m is brought down, the string which connects it to f 1, running over the pulley I, raifes the end f 1, of the canal e, which turns upon its centre r, higher than f 2; consequently, all the water which runs through the fyphon d paffes through f 2 into g 2, till the fame operation is performed in that vessel, and so on alternately. As the height the water rifes in g in an hour, viz. from s to t, is equal to the circumference of n, the float y rifing through that height along with the water, lets the weight & act upon the pulley n, which carries with it the cylinder o; and this, making a revolution, causes the index k to describe an hour on the dial plate. This revolution is performed by the pulley n f; the next is performed by n z, whilst n 1 goes bick, as the water in g I runs out through the tantalus; for y must follow the water, as its weight increases, out of it. The axis o always keeps moving the fame way; the index p describes the minutes; each tantalus must be wider than the typhon, that the veffels gg may be empired as low as s, before the water returns to them.

A fountain

6. To the tube wherein the water is to rife, fit a fpherical or lenticular head, AB, made of a plate of metal, and perforated at top with a great number of little of a flower, holes. The water rifing with vehemence towards AB, will be there divided into innumerable little threads, and afterwards broke, and dispersed into the finest drops.

A fountain 7. To the tube AB, folder two fpherical fegments C and D, almost touching each other; with a screw E, fpreads the to contract or amplify the interffice or chink at pleafure. Others choose to make a smooth, even cleft, in table cloth, a fpherical or lenticular head, fitted upon the tube. The water spouting through the chink, or cleft, will

expand itself in manner of a cloth.

The globu-8. Make a hollow globe A, of copper or lead, and of lar fountain a fize adapted to the quantity of water that comes from the pipe to which it is to be placed. Pierce a CCXLIII. number of small holes thro' this globe, that all tend towards its centre; observing, however, that the diameters of all these holes, taken together, mult not exceed that of the pipe at the part from whence the. water flows. Annex to it a pipe B, of fuch height as you think convenient; and let it be screwed at C, to the pipe from whence the jet flows. The water that comes from the jet rushing with violence into the globe, will be forced out at the holes, with the direction in which they are made, and will produce a very pleafing fphere of water.

9. Procure a little figure made of cork, as AB, which you may paint, or dress in a light stuff, after your own fancy. In this figure you are to place the finall hollow cone C, made of thin leaf-brais. When

the figure is placed on the jet-d'eau that plays in a Entertainperpendicular direction, it will remain fulpended on ing experithe top of the water, and perform a great variety of

If a hollow ball of copper, of an inch diameter, and very light, be placed on a fimilar jet, it will in like manner, remain suspended, revolving on its centre, and spreading the water all round it, in the manner reprefented by fig. 6. or Plate CCXLIV. fig. 1 .- But note, that as it is necessary the ball, &c. when on the defcent, thould keep the fame precise perpendicular wherein it rose (fince otherwise it would miss the stream and fall downright), fuch a fountain should only be played

in a place free from wind.

10. Make a hollow leaden cone A, whose axis is one- The hemithird of the diameter of its base. The circle C, that sherical forms its base, must be in proportion to the surface of pla water that flows from the jet on which it is to be pla-CCXLV. ced, that it may flow from it equally on all fides. To fig. 1. the cone join the pipe B, which ferves not only as a fupport, but is to be pierced with a number of holes, that it may supply the cone with a sufficient quantity of water. Screw the tube just mentioned to the top of that from whence the jet proceeds .- The water that rushes into the cone from the pipe, will run over its circumference, and form a hemispherical cascade. If this piece be so constructed that it may be placed in a reverled position, it will produce a fountain in the form of a vale, (see fig. 2); and if there be a sufficient quantity of water, both these pieces may be placed on the same pipe, the fountain at top and the cascade underneath, which by their variety will produce a very pleating appearance.

11. Let there be two portions of a hollow fphere, that The waterare very shallow: and let them be so joined together, funthat the circular space between them may be very nar- CCXLIV. row. Fix them vertically to a pipe from whence a jet fig. 5. proceeds. In that part by which the portions of the fphere are joined, there must be made a number of holes; then the water ruthing into the narrow cavity will be forced out from the holes, and produce a regular figure of the fun, as in the plate. This piece requires a large quantity and force of water to make it

appear to advantage.

Several pieces of this fort may be placed over each other, in a horizontal direction, and so that the same pipe may fupply them all with water (fee fig. 6. of plate CCXLV.) It is proper to observe, that the diameter of these pieces must continually diminish, in pro-

portion to their distance from the bottom. 12. Make a hollow circle A, the fides of which are to The revolbe pierced with 12 or 15 holes, made in an inclined ving waterdirection: or you may place the like number of fmall Plate tubes round the circle. Fix this circle on the top. of a jet, in such manner that it may turn freely round, fig. 8. The water rushing violently into the hollow circle will keep it it continual motion; and at the fame time forcing out of the holes or fmall tobes, will form a revolving figure with rays in different directions, as in the plate.

13. Provide a strong copper vessel A, of such figure as The comyou think convenient; in which folder a pipe BE, ofp effed jet the fame metal. Let there be a cock at H, which must fig. 12. be made fo tight that no air can pass by it. . The pipe BE must go very near the bottom of the vessel, but

The hydancer, fig. 5.

DO:

ing experi- extremity G there is a very fmall hole: this pipe must _, be fcrewed into the former.

The veilel being thus disposed, take a good fyringe; and placing the end of it in the hole at G, open the cock, and force the air into the veffel; then turn the cock and take ont the fyringe. Repeat this operation feveral times, till the air in the veffel be ftrongly condenfed. Then fill the fyringe with water, and force it into the veffel, in the fame manner as you did the air; and repeat this operation till you can force no more water into the vellel; then shut the cock. This vessel will be always ready to perform an extempore jet d'eau: for, on turning the cock, the fpring of the compressed air will force out the water with great violence, and the jet will continue, though constantly decreasing in force, till the water is all exhausted, or the air within the veffel is come to the fame denfity with that

The marfel, fig. 14.

inverted,

fpilt,

Plate

fig. 4.

CCXLV.

fig. 13.

14. Let there be made a tin veffel, about fix inches vellous vef high, and three inches in diameter. The mouth of this vessel must be only one quarter of an inch wide; and in its bottom make a great number of fmall holes about the fize of a common fewing needle. Plunge this vessel in water, with its mouth open; and when it is full, cork it up and take it out of the water. So long as the veffel remains corked, no water whatever will come out; but as foon as it is uncorked, the water will iffue out from the fmall holes at its bottom. You must observe, that if the holes at its bottom of the vessel be more than one fixth of an inch diameter, or if they be in too great number, the water will run out though the veffel be corked; for then the preffure of the air against the bottom of the vessel will not be fufficient to confine the water.

A glass full An experiment fimilar to this is made with a glass filled with water, over which a piece of paper is placed. and the wa- The glass is then inverted; and the water, by the pressure of the air under it, will remain in the glass. That the paper, though the feeming, is not the real,

fupport of the water, will appear from no 25.

15. In this fountain, the air being compressed by The circulating foun- the concealed fall of water, makes a jet, which, after

fome continuance, is confidered by the ignorant as a perpetual motion; because they imagine that the same water which fell from the jet arises again. The boxes CE and DYX being close, we see only the bason ABW, with a hole at W, into which the water fpouting at B falls; but that water does not come up again; for it runs down through the pipe WX into the box DYX, from whence it drives out the air through the ascending pipe YZ, into the cavity of the box CE, where, pressing upon the water that is in it, it forces it out through the fpouting pipe OB, as long as there is any water in CE; fo that this whole play is only whilit the water contained in CE, having fpouted out, falls down through the pipe WX into the cavity DYX. The force of the jet is proportionable to the height of the pipe WX, or of the boxes CE and DY above one another: the height of the water, measured from the bason ABW to the surface of the water in the lower box DYX, is always equal to the height measured

from the top of the jet to the furface of the water in

the middle cavity at CE. Now, fince the furface CE

is always falling, and the water in DY always rifing,

Entertain- not touch it. There must be another pipe F, at whose the height of the jet must continually decrease, till it Entertainis shorter by the height of the depth of the cavity CE, ing experi-

which is emptying, added to the depth of the cavity DY, which is always filling; and when the jet is fallen fo low, it immediately ceases. The air is reprefented by the points in this figure. To prepare this fountain for playing, which should be done unobserved, pour in water at W, till the cavity DXY is filled; then invert the fountain, and the water will run from the cavity DXY into the cavity CE, which may be known to be full, when the water runs out at B held down. Set the fountain up again, and, in order to make it play, pour in about a pint of water into the bason ABW; and as soon as it has filled the pipe WX, it will begin to play, and continue as long as there is any water in CE. You may then pour back the water left in the bason ABW, into any vessel, and invert the fountain, which, being fet upright again, will be made to play, by putting back the water

poured out into ABW; and fo on as often as you

pleafe.

The fountain fig. 3. is of the fame kind; but liaving double the number of pipes and concealed cavities, it plays as high again. In order to understand its structure, see fig. 7. The bason is A, the four cavities are B, C, D, and E, from which the water through the pipe f G spouts up to double the height of the fountain, the air at E, which drives it, being doubly condensed. The water going down the pipe I (e. gr. three feet long), condenses the air that goes up into the cavity C through the pipe z, so as to make it To ftronger than the common air; then the water, which falling in the pipe 3 from C to D, is capable, by the height of its fall, of condenfing the air at E, fo as to make it To stronger, being pushed at C by air already condensed into 1 to less space, causes the air at E to be condensed twice as much; that is, to be ! ftronger than common air; and therefore it will make the water at G foout out with twice the force, and rife twice as high as it would do if the fountain had been of the same structure with the former. In playing this fountain turn it upfide down, and taking out the plugs g, b, fill the two cavities C and E, and having thut the holes again, fet the fountain npright, and pour some water into the bason A, and the jet will play out at G; but the fountain will begin to flay too foon, and therefore the best way is to have a cock in the pipe 3, which, being open, whilit the cavities C and E are filled, and thut again before the fountain is fet up, will keep the water thrown into the bafon from going down the pipe I, and that of the cavity C from going down the pipe 3, by which means the fountain will not play before its time, which will be as foon as the cock is

16. Procure a tin vessel ABC, five inches high and The magifour in diameter; and let it be closed at top. To the cal cascade, bottom of this veffel let there be foldered the pipe DE, fig. 5. of ten inches length, and half an inch in diameter: this pipe must be open at each end, and the upper end must be above the water in the veffel. To the bottom also fix five or fix fmall tubes F, about one-eighth of an inch diameter. By these pipes the water contained in

the veffel is to run flowly out. Place this machine on a fort of tin bafon GH, in the middle of which is a hole of one quarter of an inch diameter.

Entertain- diameter. To this tube DE, fix fome pieces that may

ing experi- fupport the veffel over the bason; and observe that the end D, of the tube DE, must be little more than one quarter of an inch from the bason. There must be also another veffel placed under the bason, to receive the

water that runs from it.

Now, the fmall pipes discharging more water into the bason than can run out at the hole in its centre, the water will rife in the bason, above the lower end of the pipe DE, and prevent the air from getting into the veffel AB; and confequently the water will ceafe to flow from the fmall pipes. But the water continuing to flow from the bason, the air will have liberty again to enter the veffel AB, by the tube DE, and the water will again flow from the fmall pipes. Thus they will alternately stop and slow as long as any water remains in the veffel AB.

As you will eafily know, by observing the rife of the water, when the pipes will ceafe to flow, and by the fall of it, when they will begin to run again, you may fafely predict the change; or you may command them to run or ftop, and they will feem to obey your

The illumifig. 9.

17. This fountain begins to play when certain cannated foun dles placed round it are lighted, and stops when those candles are extinguished. It is constructed as follows. Provide two cylindrical veffels, AB and CD. Connect them by tubes open at both ends, as HL, FB, &c. fo that the air may descend out of the higher into the lower veffel. To these tubes fix candlesticks H, &c. and to the hollow cover CF, of the lower veffel, fit a fmall tube EF, furnished with a cock G, and reaching almost to the bottom of the vessel. In G let there be an aperture with a ferew, whereby water may be poured

> Now, the candles at H, &c. being lighted, the air in the contiguous pipes will be thereby rarified, and the jet from the fmall tube EF will begin to play: as the air becomes more rarified, the force of the jet will increase, and it will continue to play till the water in the lower veffel is exhausted. It is evident, that as the motion of the jet is caused by the heat of the candles, if they be extinguished, the fountain must prefently

The folar

18. This fountain is contrived to play by the fpring of the air, increased by the heat of the fun, and serves also for a dial at the same time. GNS is a hollow globe of thin copper, eighteen inches in diameter, fupported by a fmall inverted bason, resting on a frame ABC, with four legs, between which there is a large bason of two feet diameter. In the leg C there is a concealed pipe, proceeding from G, the bottom of the infide of the globe, along HV, and joining an upright pipe u I, for making a jet at I. The fhort pipe I u, going to the bottom of the bason, has a valve at u under the horizontal part HV, and another valve at V

above it, and under the cock, &. At the north pole Entertain-N, there is a fcrew for opening a hole, through which ing experithe globe is supplied with water. When the globe is half filled, let the machine be fet in a garden, and as the fun heats the copper and rarifies the included air, the air will press upon the water, which, descending through the pipe GCHV, will lift up the valve V, and flut the valve u, and the cock being open, fpout out at I, and continue to do fo for a long time if the fun shines, and the adjutage be small. At night, as the air condenses again by the cold, the outward air pressing into the adjutage I, will shut the valve V, but by its pressure on the bason DuH, push up the water which has been played in the day-time through the valve u, and the pipe "HG into the globe, fo as to fill it up again to the same height which it had at first, and the next fun-shine will cause the fountain to play again, &c. The use of the cock is to keep the fountain from

If the globe be fet to the latitude of the place, and rectified before it be fixed, with the hour-lines or meridians drawn upon it, the hours marked, and the countries painted, as on the common globe, it will form a good dial: the fun then shining upon the same places in this globe as it does on the earth itself. This

playing till you think proper: a fmall jet will play fix

fountain was invented by Dr Defaguliers.

or eight hours.

19. There is a pretty contrivance, by which the fpe. The hycinc gravity of the body is fo altered, that it rifes and draulic difinks in water at our pleasure. Let little images of men, about an inch high, of coloured glass, be bespoke at a glass-house; and let them be made so as to be hollow within, but fo as to have a fmall opening into this hollow, either at the fole of the foot or elfewhere. Let them be fet afloat in a clear glass phial of water, filled within about an inch of the mouth of the bottle; then let the bottle have its mouth closed with a bladder. closely tied round its neck, so as to let no air escape one way or the other. The images themselves are nearly of the same specific gravity with water, or rather a little more light, and confequently float near the furface. Now when we press down the bladder, tied on at the top, into the mouth of the bottle, and thus press the air upon the surface of the water in the bottle: the water being preffed will force into the hollow of the image through the little opening: thus the air within the images will be prefled more closely together, and being also more filled with water now than before, the images will become more heavy, and will confequently descend to the bottom; but, upon taking off the preflure from above, the air within them will again drive out the water, and they will rife to the same heights as before. If the cavities in some of the images be greater than those in others, they will rife and fall differently, which makes the experiment more

HYGEIA, in mythology. See HEALTH.

HYGIEINE, Tyun, formed of vying, " found, healthy," that branch of medicine which confiders health, and discovers proper means and remedies, with their use, in the preservation of that state.

The objects of this branch of medicine are, the non-

naturals. See DIET, EXERCISE, &c.

HYGIEINE, more largely taken, is divided into three parts; prophylactice, which foresees and prevents difeases; synteritice, employed in preserving health; and analeptice, whose office is to cure diseases, and restore health.

HYGINUS (Caius Julius), a grammarian, the freedman of Augustus, and the friend of Ovid, was born in Spain, or, according to others, in Alexandria. He wrote many books which are mentioned by ancient authors; all of which are loft, except fome fables, and a work entitled Astronomicon Poeticon; and even these are come down to us very imperfect. The best edition of these remains is that of Munker, published with fome other pieces of antiquity in 2 vols 8vo, 1681, under the title of Mythographi Latini.

HYGROMETER, an instrument for measuring the degrees of dryness or moisture of the atmosphere, in like manner as the barometer and thermometer meafure its different degrees of gravity or warmth.

Though every fubstance which swells in moift, and fhrinks in dry weather, is capable of becoming an hygrometer; yet this kind of instrument is far from being as yet arrived at fuch a degree of perfection as the barometers and thermometers. There are three general principles on which hygrometers have been conflructed. 1. The lengthening and shortening of strings by dryness and moisture, or their twilling and untwisting by the fame. 2. The fwelling and fhrinking of folid fubstances by moisture or dryness; and, 3. By the increase or decrease of the weight of particular bodies whose nature is to absorb the humidity of the atmosphere.

I. On the first of these principles Mr Smeaton hath constructed an hygrometer greatly superior to any that had appeared before; and of which the following account is given in the 62d volume of the Philosophical

" Having fome years ago attempted to make an accurate and fensible hygrometer by means of a hempen cord of a confiderable length, I quickly found, that, though it was more than fufficiently fufceptible of every change in the humidity of the atmosphere, yet the cord was upon the whole in a continual state of lengthening. Though this change was the greatest at first, yet it did not appear probable that any given time would bring it to a certainty; and, furthermore, it feemed, that as the cord grew more determinate in mean length, the alteration by certain differences of moisture grew less. Now, as on considering wood, catgut, paper, &c. there did not appear to be a likelihood of finding any fubstance sufficiently sensible of differences of moitture that would be unalterable under Nº 161.

Hygeia ders who had been guilty of fuch enormities, that they construction which would readily admit of an adjust- Hygromeis actuated may be variable in itfelf, both as to abfolute length, and difference of length under given degrees of moisture, yet that, on supposition of a material departure from its original scale, it might be redily restored thereto; and, in confequence, that any number of hygrometers fimilarly constructed, might, like thermometers, be capable of speaking the same language.

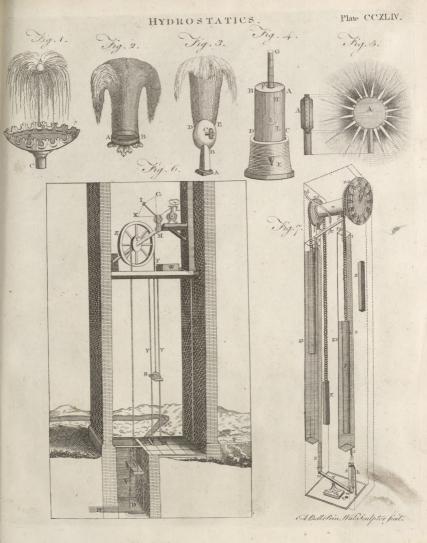

"The two points of heat the more readily determinable in a thermometer, are the points of freezing and boiling water. In like manner, to construct hygrometers which shall be capable of agreement, it is necessary to establish two different degrees of a moifture which shall be as fixed in themselves, and to which we can have recourse as readily and as often as possible.

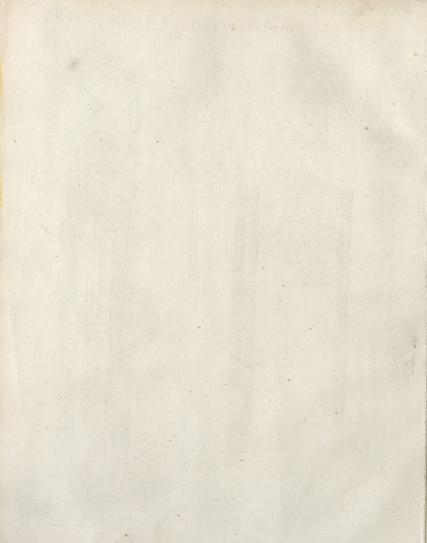

" One point is given by making the fubstance perfeetly wet, which feems fufficiently determinable; the other is that of perfect dry, which I do not apprehend to be attainable with the fame precision. A readiness to imbibe wet, fo that the fubstance may be foon and fully faturated, and also a facility of parting with its moisture on being exposed to the fire to dry; at the fame time, that neither immersion, nor a moderate exposition to the warmth of the fire, shall injure its texture ; are properties requisite to the first mover of such an hygrometer, that in a manner exclude all fubflances that I am acquainted with, besides hempen and flaxen threads and cords, or fubftances compounded of them.

" Upon these ideas, in the year 1758, I constructed two hygrometers as nearly alike as possible, in order that I might have the means of examining their agreement or difagreement on fimilar or difficular treatment. The interval or fcale between dry and wet I divided into 100 equal parts, which I call the degrees of this hygrometer. The point of o denotes perfect dry; and the numbers increase with the degrees of

moisture to 100, which denotes perfect wet.

" On comparing them for some time, when hung up together in a passage or staircase, where they would be very little affected by fire, and where they would be exposed to as free an air as possible in the inside of the house, I found that they were generally within one degree, and very rarely differed two degrees; but as these comparisons necessarily took up some time, and were frequently interrupted by long avocations from home, it was fome years before I could form a tolerable judgment of them. One thing I foon observed, not altogether to my liking, which was, that the flaxen cords made use of seemed to make so much resistance to the entry of small degrees of moisture (such as is commonly experienced within doors in the fituation above mentioned), that all the changes were comprifed within the first 300 of the scale; but yet, on exposing them to the warm fleam of a wash-house, the index quickly mounted to 100. I was therefore defirous of impregnating the cords with fomething of a faline nature, which should dispose them more forcibly to attract moisture; in order that the index might, with the ordinary changes of the moisture in the atmosphere, travel over a greater part of the scale of 100. How to do this in a regular and fixed quantity, was the fubject of many experiments, and feveral years interrupted inquiry. the fame degrees thereof; this led me to confider of a AtlaftI tried the one hereafter described, which seemed

upon the whole it does not appear probable that ever this inftrument will be made capable of fuch an accurate agreement as the mercurial thermometers are, yet if we can reduce all the difagreements of an hygrometer within 10th part of the whole feale, it will probably be of use in some philosophical inquiries, in lieu of inftruments which have not yet been reduced to any common scale at all.

"Fig. 1. and 2. ABC is an orthographic delinea-CCXLVI. tion of the whole inftrument feen in front in its true CCXLVII. proportion. DE is that of the profile, or inftrument feen edgewise. FG in both represents a flaxen cord about 35 inches long, fulpended by a turning per F, and attached to a loop of brass wire at A, which goes down into the box cover H, and defends the index, &c. from injury; and by a glass exposes the scale to view.

" Fig. 3. shows the instrument to a larger scale, the upright part being shortened, and the box-cover removed; in which the fame letters represent the fame parts as in the preceding figures; GI are two loops or long links of brass-wire, which lay hold of the index KI., moveable upon a fmall flud or centre K. The cord FG is kept moderately strained by a weight M of about half a pound avoirdupois. - It is obvious, that, as the cord lengthens and shortens, the extreme end of the index rifes and falls, and fucceffively paffes over N 2 the scale disposed in the arch of a circle, and containing 100 equal divisions. This scale is attached to the brass sliding ruler QP, which moves upon the directing piece RR, fixed by ferews to the board, which makes the frame or base of the whole; and the scale and ruler NOP is retained in any place nearer to or further from the centre K, as may be required by the

" Fig. 4. represents in profile the sliding piece and flud I (fig. 3.), which traverses upon that part of the index next the centre K; and which can, by the two fcrews of the flud, be retained upon any part of the index that is made parallel; and which is done for three or four inohes from the centre, for that purpose. The flud is filed to the edges, like the fulcium of a feale-beam; one being formed on the under fide, the other on the upper, and as near as may be to one another. An hook formed at the lower end of the wire-loops CI, retains the index, by the lowermost edge of the flud; while the weight M hangs by a small hook upon the upper edge : by these means the index is kept fleady, and the cords strained by the weight, with very little friction or burthen upon the central

" Fig. 5. is a parallelogram of plate-brafs, to keep out dust, which is attached to the upper edge of the box-cover H; and ferves to flut the part of the boxcover necessarily cut away, to give leave for the wire GI to traverse with the sliding flud nearer to or further from the centre of the index K; and where, in fig. 5. a is an hole of about an inch diameter, for the wire GI to pass through in the rifing and falling of the index freely without touching; b is a flit of a leffer fize, fufficient to pass the wire, and admit the cover to come off without deranging the cord or index ; cc are two fmall ferews applied to two flits, by which the plate flides lengthways, in order to adapt the hole a Vol. IX. Part I.

Hygrome to answer my intention in a great measure; and tho' to the wire GI, at any place of the slud I upon the Hygromeindex KL.

" 1. In this construction, the index KL being 12 inches long, 4 inches from the extreme end are filed fo narrow in the direction in which it is feen by the eye, that any part of these four inches lying over the divifions of the scale, becomes an index thereto. The scale itself slides four inches, so as to be brought under any part of the four inches of the index attenuated as abovementioned.

" 2. The position of the directing piece RR is fo determined as to be parallel to a right line drawn thro' o upon the scale, and the centre K of the index; confequently, as the attenuated part of the index forms a part of a radius or right line from the fame centre, it follows, that whenever the index points to o upon the feale, though the scale is moved nearer to or further from the centre of the index, yet it produces no change

in the place to which the index points.

" 3. When the divided arch of the scale is at 10 inches from the centre (that is, at its mean diffance); then the centre of the arch and the centre of the index are coincident. At other distances, the extremes of which are eight or twelve inches, the centre of the divisions, and the centre of the index pointing thereto, not being coincident, the index cannot move over the spaces geometrically proportionable to one another in all fituations of the fcale; yet the whole fcale not exceeding 30° of a circle, it will be found on computation, that the error can never be fo great as 100 part of the fcale, or 1° of the hygrometer; which in this inftrument being confidered as indivisible, the mechanical error will not be fenfible.

"The cord here made use of is flax, and between Toth and toth of an inch in diameter; which can be readily afcertained by measuring a number of turns made round a pencil or small stick. It is a fort of cord used in London for making nets, and is of that particular kind called by net-makers flaxen three-threads laid. A competent quantity of this cord was boiled in one pound avoirdupois of water, in which was put two pennyweights troy of common falt; the whole was reduced by boiling to fix ounces avoirdupois, which was done in about half an hour. As this afcertains a given strength of the brine, on taking out the cord, it may be supposed that every fibre of the cord is equally impregnated with falt. The cord being dried, it will be proper to stretch it; which may be done fo as to prevent it from untwifting, by tying three or four yards to two nails against a wall, in an horizontal position, and hanging a weight of a pound or two to the middle, fo as to make it form an obtuse angle. This done for a week or more in a room, will lay the fibres of the cord close together, and prevent its firetching fo fast after being applied to the instrument as it would otherwise be apt to do.

"The hygrometer is to be adjusted in the following manner. The box-cover being taken off to prevent its being spoiled by the fire, and choosing a day naturally dry, fet the inftrument nearly upright, about a yard from a moderate fire; fo that the cord may become dry, and the instrument warm, but not so near as would spoil the finest linen by too much heat, and yet fully evaporate the moiflure; there let the inftrument flay till the index is got as low as it will go: Hygrome- now and then stroaking the cord betwixt the thumb the card F have passed the line E, the lower card G will Hygromeof close together; and thereby causing it to lengthen as much as possible. When the index is thus become stationary, which will generally happen in about an hour, more or lefs as the air is naturally more or lefs dry, by means of the peg at top raise or depress the index, till it lies over the point o. This done, remove the instrument from the fire; and having ready fome warm water in a tea cup, take a middling camel's hair pencil, and, dipping it in the water, gently anoint the cord till it will drink up no more, and till the index becomes flationary and water will have no more effect upon it, which will also generally happen in about an hour. If in this flate the index lies over the degree marked 100, all is right : if not, flack the ferew S, and flide the scale nearer to or further from the centre, till the point 100 comes under the index, and then the instrument is adjusted for use: but if the compass of the flide is not fufficient to effect this, as may probably happen on the first adjustment, flack the proper screws, and move the sliding stud I nearer to or further from the centre of the index, according as the angle formed by the index between the two points of dry or wet happens to be too small or too large for the fcale."

On this principle, a fimple hygrometer has been made by Mr Coventry of Southwark, London. It is not upon the most accurate construction, yet will act very fenfibly in the common changes of the air. Fig. 6. represents the hygrometer as applied to a wall or board. A is a ftring of whip-cord, catgut, &c. of any length at pleafure : it is fuspended on a bracket B, and kept extended by a weight at the bottom C. DD is a flip of wood, which with the bracket is fixed perpendicularly to a wall or fide of a room. It has a ftraight line E drawn down in the middle of the board, ferving to point out the divisions upon the edges of the two thin circular cards F and G. At the centre of the bottom of each of these cards is glued a piece of cork, through which the ftring A is drawn: These cork-pieces ferve to preferve the horizontal position of the cards. The upper card F is divided into 10 equal parts or divisions, and the under card G into 100 equal parts; the string A being measured into 10 equal parts, from the point of suspension H to the surface of the lower card I. The card F is hung at the first part from H, and the card G at the 10th part from the fame point : confequently, from the twifting and untwisting of the string A by the different changes of the air, the lower card G, from the mechanical principles of motion, will describe to revolutions for one of the upper card F; or, when the lower card G has made one revolution, the upper card F will have defcribed but the 10th part, or one of its divisions. From whence it appears, that by the affiftance of the upper card F, an index is thereby obtained of the number of revolutions the lower eard G performs, which are reckoned by the line E on the flip of wood.

Example. It must first be observed what division of the card F the line E is against, suppose 3 and also what division of the lower card G is cut by the same line, suppose 10: it then appears, that the flate of the hygrometer is thus, 3 degrees and 10

and finger downwards, in order to lay the fibres there- have revolved 10 times, or 10 hundred parts, equal to 1000; the accuracy to which the principle of this fimple contrivance answers. Before use, the hygromoter should be adjusted; to do which, the cards F and G are first set to the line E at the o of each, or commencement of the graduations; whatever direction the cards afterwards take, it must evidently be from the change to greater moisture or dryness in the air: and they will accordingly point it out.

On this principle, but with a degree of ingenuity and pains perhaps never before employed, an hygrometer has been constructed by M. de Saussure, professor of philosophy at Geneva. In his Estais fur P Hygrometrie, in 4to, 1783, is an important detail on the subject of hygrometry; from which the following description of his hygrometer is taken. The author found by repeated experiments, that the difference between the greatest extension and contraction of a hair, properly prepared, and that has a weight of about three grains suspended to it, is nearly $\frac{1}{450}$ of its whole length; that is, $3\frac{1}{2}$, or $3\frac{2}{3}$ lines in a foot. This circumflance fuggefted the idea of a new hygrometer: And, in order to render those small variations perceptible and ufeful, the following apparatus was constructed.

Fig. 7. is a representation of the whole instrument, with the hair and other appendages complete. The lower extremity of the hair ab is held by the chaps of the fcrew pincers b. These pincers are represented aside at B: by a screw at its end, it sastens into the nut of the bottom plate C. This nut of the plate turns independently of the piece that supports it, and ferves to raife or depress the pincers B at pleasure.

The upper extremity a of the hair is held by the under chaps of the double pincers a, represented aside at A. These pincers fasten the hair below, and above fastens a very fine narrow slip of filver, carefully annealed, which rolls round the arbor or cylinder d, a feparate figure of which is shown at DF. This arbor, which carries the needle or index ee, or E in the feparate figure, is cut in the shape of a screw; and the intervals of the threads of this fcrew have their bases flat, and are cut squarely so as to receive the slip of filver that is fastened to the pincers a, and joined in this manner with the hair. M. Saussure observes, that hair alone fixed immediately to the arbor would not do; for it curled upon it, and acquired a stiffness that the counterpoife was not able to furmount. The arbor was cut in a fcrew form, in order that the flip of filver in winding upon it should not increase the diameter of the arbor, and never take a fituation too oblique and variable. The flip is fixed to the arbor by a fmall pin F. The other extremity of the arbor D is shaped like a pulley, flat at the bottom fo as to receive a fine fupple. filken string, to which is suspended the counterpoise g in the large figure, and G in the fide one. This counterpoife is applied to diftend the hair; and acts in a contrary direction to that of the hair, and the moveable pincers to which the hair is fixed. If then the hair should be loaded with the weight of four grains, the counterpoife must weigh four grains more than the pincers. The arbor at one end paffes through the centre of the dial, and turns therein, in a very fine hole, on a pivot made very cylindrical and well polished: at hundredths of another. If the whole 10 divisions of the other end is also a similar pivot, which turns in an

HI. This cock is fixed behind the dial by means of the fcrew I.

The dial keek, divided into 360 degrees, is supported by two arms 11; these are soldered to two tubes, which inclose the cylindrical columns mmm. The fetting fcrews nn move upon these tubes, and serve thereby to fix the dial and arbor to any height required. The two columns which support the dial are firmly fastened to the case of the hygrometer, which rest upon the four screws oooo; by the assistance of these screws, the instrument is adjusted, and placed in a vertical fituation.

The square column p p, which rests upon the base of the hygrometer, carries a box q, to which is fixed a kind of port-crayon r, the aperture of which is equal to the diameter of the counterpoife g. When the hygrometer is to be moved from one place to another; to prevent a derangement of the inftrument from the oscillations of the counterpoise, the box q, and the port-crayon r, must be raised up so as the counterpoise may fall into and be fixed in it, by tightening the ferew s and the box and counterpoife together by the ferew t. When the hygrometer is intended for use, the counterpoife must be disengaged by lowering the box, as may be conceived from the figure.

Laftly, at the top of the inflrument is a curved piece of metal x, y, z, which is fastened to the three columns just described, and keeps them together. It has a fquare hole at y, which ferves to hang up the hygro-

meter by when required

The variations of which this hygrometer is capable, are (all things befides equal) as much greater as the arbor round which the flip of filver winds is than a fmaller diameter, and as the inftrument is capable of receiving a longer hair. M. Sauffure has had hygrometers made with hairs 14 inches long, but he finds one foot fufficient. The arbor is three-fourths of a line in diameter at the base between the threads of the ferew or the part on which the flip winds. The variations, when a hair properly prepared is applied to it, are more than an entire circumference, the index describing about 400 degrees in moving from extreme dryness to extreme humidity. M. Saussure mentions arbor round which it winds. But this weight cannot be fenfibly increased without still greater inconveniences: he therefore observes, that this hygrometer is well calculated for a fixed fituation in an observatory, and for various hygrometrical experiments; fince, inflead of the hair, there may be substituted any other subflance of which a trial may be wanted; and it may be kept extended by a counterpoise more or less heavy as they may require: but the inftrument will not admit of being moved, nor ferve even for experiments which may subject it to agitation.

To obviate the objection above mentioned, M. Sauffure has contrived another apparatus more portable and convenient, and which, if not fo extensive in its va-

Hygrome hole made in the end of the arm h of the cock hi, representation of this hygrometer, which he calls the Hygromeportable bygrometer, in diffinction from the preceding,

which he calls the great hygrometer or the hygrometer with the arbor. The material part of this instrument is its index abce; an horizontal view of which, and the arm that carries it, is feen in the feparate figure GBDEF. This index carries in its centre D a thin tube hollow throughout, and projects out on each fide of the needle. The axis which paffes through it, and round which the index turns, is made thin in the middle of its length and thick at the ends; fo that the cylindrical tube which it paffes through touches it only at two points, and acts upon it only at its extre-

The part de DE of the index ferves to point out and mark on the dial the degrees of moilture and diyness; the opposite part db DB serves to fix both the hair and counterpoife. This part, which terminates in a portion of a circle, and is about a line in thickness, is cut on its edge in a double vertical groove, which makes this part fimilar to the fegment of a pulley with a double neck. These two grooves, which are portions of a circle of two lines radius, and have the fame centre with that of the index d, ferve in one of them to contain the hair, and in the other the filk, to the end of which the counterpoife is suspended. The fame index carries vertically above and below its centre two fmall fcrew-pincers, fituated opposite to the two grooves: that above at a, opposite to the hindmost groove, ferves to fix the filk to which the counterpoife is fuspended; and that below at b, opposite to the hithermost groove, ferves to hold one of the ends of the hair. Each of these grooves has its partitions cut, as feen in the fection B, and its bottom made flat, in order that the hair and filk may have the greatest freedom possible. The axis of the needle DD goes thro' the arm gf GF, and it is fixed to this arm by the tightening fcrew fF. All the parts of the index should be in perfect equilibrium about its centre; fo that when it is on its pivot without the counterpoife, it will reft indifferently in any position it may be placed in.

It must be understood, that when the hair is fixed by one of its extremities in the pincers e, and by the other end on the pincers y at top of the inftrument, an inconvenience attending this hygrometer, viz. its it passes in one of the necks of the double pulley not returning to the same point when moved from one b, whilft the counterpoise to which the filk is fixed in place to another; because the weight of three grains a passes in the other neck of the same pulley: the counthat keeps the filver flip extended, cannot play to ex- terpoife ferves to keep the hair extended, and acts alactly as to act always with the same precision against the ways in the same direction and with the same force. whatever the fituation of the index may be. When therefore the dryness contracts the hair, it overpowers the gravity of the counterpoife, and the index defcends: when, on the contrary, the humidity relaxes the hair, it gives way to the counterpoife, and the index afcendy The counterpoise should weigh but three grains; for that the index should be made very light and very easy in its motion, in order that the least poslible force may move it and bring it back again to its point when drawn aside.

The dial beb is a circular arch, the centre of which is the fame with that of the index. This arch is divided into degrees of the fame circle, or into the hundredths of the interval which is found between the liriations, is in fact very firm, and not in the least liable mits of extreme dryness and extreme humidity. The to be deranged by carriage and agitation. Fig. 8. is a interior edge of the dial carries at the distance hi a

Portable

curved to the arch, and fixed in the points ii. Thisbridle retains and guards the index, at the same time leaving it to play with the requifite freedom. The forew pincers y, in which is faltened the upper extremity of the hair, is carried by a moveable arm, which afcends and descends at pleasure the length of the frame KK. This frame is cylindrical every where elfe, except its being here flattened at the hinder part to about half its thickness, in order that the piece with the forew which carries the arm should not project out underneath, and that the arm may not turn. The aim may be flopped at any defired height by means of the prefling forew x. But as it is of use fometimes to be able to give the inftrument a very small and accurate motion, fo as to bring the index exactly to the part that may be wanted, the flide piece I, which carries the pincers y, to which the hair is fixed, is to be moved by the adjusting screw m.

At the base of the instrument is a great lever nopq; which ferves to fix the index and its counterpoife when the livgrometer is to be moved. The lever turns an axis n, terminated by a screw which goes into the frame; in tightening this forew, the lever is fixed in the defired position. When the motion of the index is to be stopped, the intended position is given to this lever, as reprefented in the dotted lines of the figure. The long neck p of the lever lays hold of the double pulley b of the index, and the short neck o of the counterpoise: the tightening screw q fastens the two necks at once. In confining the index, it must be so placed. that the hair be very flack; fo that, if whilft it is moved the hair should get dry, it may have room to contract itself. Afterwards, when the instrument is placed for use, the first thing to be done is to relax the fcrew n, and turn back the double lever with great care, taking equal caution at the fame time not to ftrain the hair. It is better to apply one hand to the index near its centre, whilft the other hand is difengaging the pulley and the counterpoise from the lever that holds them fleady. The hook r ferves to fulpend a thermometer upon; it should be a mercurial one, with a very small naked bulb or ball, so as to show in the most fensible manner the changes of the air: it should be mounted in metal, and guarded in such a manner as not to vibrate fo as to break the bair. Lastly, a notch is made under the top of the frame s, to mark the point of suspension, about which the instrument is in equilibrium, and keeps a vertical fituation.

All the instrument should be made of brass : though the axis of the index and its tube work more pleafantly together if made of bell metal.

The extent of this hygrometer's variations is not more than the fourth or fifth part of the hygrometer with the arbor. It may be augmented by making the fegment of the pulley to which the hair is fixed of a fmaller diameter; but then the hair, in moving about it, would fret and contract a stiffness, which would cause it to adhere to the bottom of the neck. M. Sauffure is of opinion, that the radius of this pulley should not be lefs than two lines, at least that there should be adapted a plate of filver or fome other contrivance; but then the hygrometer would be too difficult to conftruct, and it would require too much attention and care on the part of those who use it : his object was.

Hygrome kind of projecting bridle or flay ii, made of brass wire, to make an instrument generally useful, and easy Hygrome and convenient in its use. The hygrometer with the arbor may be used for observations which require an extreme fenfibility.

The variations of this inftrument may be augmented by making it higher, because in that case longer hairs might be adapted; but it would be then less portable. Besides, if the hair is too long when observations are made in the open air, the wind has too great an effect: upon it, and thus communicates to the index inconvenient vibrations. It is not proper therefore to make it more than a foot in height. When it is of this dimension, an hair properly prepared can be applied to it, and its variations from extreme drynels toextreme humidity are 80 or even 100 degrees; which . on a circle of 3 inches radius forms an extent sufficient for observations of this kind. M. Saussure has even made fmaller instruments that may be carried conveniently in the pocket, and to make experiments with under small receivers: they were but seven inches high by two inches of breadth; which, not withstanding their variations, were very fenfible.

Thus much for the construction of the various parts of the inftrument. The limits of this work will not admit of our inferting the whole of M. Sauffure's fubfequent account of the preparation of the hair, the manner of determining the limits of extreme humidity and of extreme drynefs, the pyrometrical variations of the hair, and the graduation of the hygrometer. The following abstract must therefore fuffice.

In the preparation of the hair, it was found neceffary to free it of a certain unctuofity it always has in its natural state, which in a great measure deprives it of its hygrometrical fenfibility A number of hairs are boiled in a lye of vegetable alkali; and among these are to be chosen for use such as are most transparent, bright, and fost: particular precautions are necessary for preventing the straining of the bair, which renders it unfit for the intended purpose.

The two fixed points of the hygrometer are the extremes both of moisture and dryness. The former is obtained by exposing the instrument to air completely : faturated with water; and this is effected by placing it in a glass receiver standing in water, the sides of which are kept continually moistened. The point on the dial, at which the hand after a certain interval remains stationary, is marked 100. The point of extreme dryness, not absolute dryness, for that does not exift, but the greatest degree of it that can be obtained, is produced by introducing repeatedly into the same receiver containing the instrument, and standing now upon quickfilver, certain quantities of deliquescent alkaline falts, which absorb the moisture of the air. The highest point to which the hand can be brought by this operation, not only when it will rife no higher, but when it becomes retrograde from the dilatation occasioned by heat, is called o; and the arch between these two points is divided into 100 equal parts, being degrees of the hygrometer. The arch pp, upon which the scale is marked in the instrument (represented in fig. 2.) being part of a circle of three inches diameter; hence every degree measures about i of a line. In the flationary hygrometer, fig. 1. the scale upon the complete circular dial is fo much larger, that every

Nyerome. degree measures about five lines : but this M. Saussure confiders as far from being a perfection, that it is rather an inconvenience; fince the instrument becomes thereby fo very fusceptible of the least impression, that there is even no approaching it without a fensible variation. The thermometer, adapted as before mentioned, serves to correct the changes of temperature: towards the extreme drynefs, 10 of the thermometer produces on the hair an effect of t deg. of the hygrometer; but towards the extreme of moilture, the fame difference of temperature causes an effect no less than 3° on the hygrometer. He constructed two tables, that gave the intermediate hygrometrical variations for fingle degrees of the thermometer at different parts of the fcale.

The whole range of the atmospherical variations takes in about 750 of this scale; a dryness of more than 250 being always the effect of art. The fensibility of this infirument is fo very great, that being ex. posed to the dew, he mentions that it varies above 400 in about 20 minutes of time. Being removed from a very moist into a very dry air, it varied in one instance no less than 350 in three minutes. He fays that its variations were always found uniform in different inftruments fuspended in different parts of the fame atmosphere. This hygrometer is considered by the author as possessed of all the properties requisite in fuch an instrument. These are, 1. That the degrees in the scale be sufficiently large, and to point out even the least variation in the dryness or moisture of the atmosphere. 2. That it be quick in its indications. 3. That it be at all times confident with itself; viz. that in the same state of the hair it always points to the same degree. 4. That several of them agree with one another. 5. That it be affected only by the aqueous vapours. 6 That its variations be ever proportionate to the changes in the air.

Not many of these hygrometers have yet been made in London. A confiderable degree of trouble and delicacy is requifite in the preparation of the hair, and it is very fragile; circumstances which may prevent it from coming into general use among common observers, although probably it may be the best in principle

of any yet made.

II. On the fecond general principle, namely, that of the swelling of folid bodies by moisture, and their contraction by dryness, M. De Luc's instrument is the best. He makes choice of ivory for the construction of his hygrometer, because he finds, that, being once wetted, ivory regularly fwells by moisture, and returns exactly to the fame dimensions when the moisture is evaporated, which other bodies do not. This hygrometer is represented in fig. 9. where a ab is an ivory tube open at the end a a, and close at b. It is made of a piece of ivory taken at the dittance of fome inches from the top they may be feen through the ivory pipe, which is thin of a pretty large elephant's tooth, and likewife at the enough to have fome transparency. These being colfame distance from its surface, and from the canal which reaches to that point. (This particular direction is given, that the texture of the ivory in all different hygrometers may be the fame, which is of great importance.) This piece is to be bored exactly in the direction of its fibres; the hole must be very straight, its dimensions 21 lines in diameter, and 2 inches 8 lines in depth from a a to c. Its bore is then to be exactly filled with a brass cylinder, which, however, must pro-

ject fomewhat beyond the ivory tube; and thus it is to Hygromebe turned on a proper machine, till the thickness of the ivory is exactly to of a line, except at the two extremities. At the bottom b the tube ends in a point; and at the top a a it must for about two lines be left a little thicker, to enable it to bear the pressure of another piece put into it. Thus the thin or hygrometrical part of the tube will be reduced to 21 French inches, including the concavity of the bottom. Before this piece is used, it must be put into water, so that the external part alone may be wetted by it; and here it is to remain till the water penetrates to the infide, and appears in the form of dew, which will happen in a few hours. The reason of this is, that the ivory tube remains fomewhat larger ever after it is wetted the first time.

For this hygrometer, a glass tube must be provided about 14 inches long, the lower end of which is shown in d d e e. Its internal diameter is about a of a line. If now the ivory tube is exactly filled with mercury, and the glass one affixed to it, as the capacity of the former decreases by being dried, the mercury will be

forced up into the glass one.

The piece ffgg is intended to join the ivory with the glass tube. It is of brass, shaped as in the figure. A cylindrical hole is bored through it, which holds the glass tube as tight as possible without danger of breaking it; and its lower part is to enter with fome degree of difficulty into the ivory pipe. To hinder that part of the tube which incloses the brass piece from being affected by the variations of the moisture, it is covered with a brass verrel represented in b bii. The pieces must be united together with gum-lac or

The introduction of the mercury is the next operation. For this purpose, a slip of paper three inches wide is first to be rolled over the glass tube, and tied fast to the extremity nearest the ivory pipe. A horsehair is then to be introduced into the tube, long enough to enter the ivory pipe by an inch, and to reach three or four inches beyond the extremity of the glass one. The paper which has been shaped round the tube must now be raifed, and used as a funnel to pour the mercury into the inftrument, which is held upright. The purest quickfilver is to be used for this purpose, and it will therefore be proper to use that revived from cinnabar. It eafily runs into the tube; and the air escapes by means of the horfe-hair, affifted with fome gentle shakes. Fresh mercury must from time to time be fupplied, to prevent the mercurial tube from being totally emptied; in which case, the mercurial pellicle which always forms by the contact of the air would run in along with it.

Some air-bubbles generally remain in the tube: lected together by shaking, must be brought to the top of the tube, and expelled by means of the horfehair. To facilitate this operation, fome part of the mercury must be taken out of the tabe, in order that the air may be less obstructed in getting out, and the horse-hair have a free motion to affilt it. Air, however, cannot be entirely driven out in this manner. It is the weight of the mercury with which the tube is for that reason to be filled, which in time completes Typermie: its expulsion, by making it pass through the pores of verter theory. To hasten this, the hygrometers are put into a proper box. This is fixed nearly in a vertical wind direction to the faddle of a horfe, which is fet a trotting for a few hours. The flakes fometimes divide the column of mercury in the glafs tube, but it is cally reunited with the horfe-hair. When, upon flaking the hygrometer vertically, no fmall tremulous motioned in is any longer perceived in the upper part of the co-Sauff

lumn, one may be fure that all the air is gone out. The scale of this hygrometer may be adjusted, as foon as the air is gone out, in the following manner. The instrument is to be suspended in a vessel of water cooled with ice, fresh quantities of which are to be added as the former melts. Here it is to remain till it has funk as low as it will fink by the enlargement of the capacity of the ivory tube, owing to the moisture it has imbibed. This usually happens in seven or eight hours, and is to be carefully noted. In two or three hours the mercury begins to afcend, because the moiflure passes into the cavity, and forces it up. The lowest station of the mercury is then to be marked o; and for the more accurate marking the degrees on the fcale, M. De Luc always chofe to have his hygrometrical tube made of one which had formerly belonged to a thermometer. The reason of this is, that in the thermometer the expansion of the mercury by heat had been already determined. The distance between the thermometrical points of melting ice and boiling water at 27 French inches of the barometer was found to be 1937 parts. The bulb of this preparatory thermometer was broke in a bason, in order to receive carefully all the mercury that it contained. This being weighed in nice fcales amounted to 1428 grains. The hygrometer contained 460 grains of the same mercury. Now it is plain, that the extent of the degrees on the hygrometer, ought to be to that of the degrees on the preparatory thermometer as the different weights of the mercury contained in each; confequently 1428: 460: 1937: 624 nearly; and therefore the corresponding intervals ought to follow the same proportion: and thus the length of a scale was obtained, which might be divided into as many parts as he pleafed.

Fig. 10. is a reprefentation of De Luc's hygrometer when fully confruided. In elegance it far exceeds Smeaton's or any other, and probably also in accuracy; for by means of a small thermometer fixed on the board along with it, the expansion of the mercury by heat may be known with great accuracy, and of confequence how much of the height of the mercury in the hygrometer is owing to that cause, and how much to the mer moisture of the atmosphere.

M. De Luc having continued his inquiries further into the modifications of the atmosphere, mentions in his
Helf-put McGievologistanother hygrometer, which hefinds
to be the beft adapted to the medjure of local humidity.
Of all the hygrofocpic fubblances which the tried for this
purpole, that which answers the beft is a flip of whalebone
cut transverley to the direction of the fibres, and made
extremely thin; for on this depends its fensibility. A
flip of 12 inches in length and a line in breadth, he has
made for thin as to weigh only half a grain; and it may
be made fill thinner, but is then of too great fensibitity, being affected even by the approach of the obfer-

ver. This flip is kept extended by a small spring, Hygron and the variations in its length are measured by a ter-vernier division, or by, which is perhaps better, an index on a dial plate: the whole variation from extreme dry-ness to extreme mositure is about \(\frac{1}{2} \) of its length.

These hygrometers are made by Mr Adams, and Mr W. Jones, London. The slip of whalebone is mounted in a frame very similar to that belonging to M. Saussure's hygrometer before described (see ig. 7-.) The only material difference is, that a small concentric wire spring is used, instead of a counterposite, to keep the slip of whalebone extended. M. Saussure had tried such a spring applied to his hairs; but the weakest spring he found too strong for the hair; and he was further apprehensive, that the variations which the cold, heat, and the weather infallibly make, would

fuffer from the force of the springs.

M. de Luc, in the hygrometers he formerly made, as before described (made of ivory), had graduated them from one fixed point only, that of extreme moisture, which is obtained by foaking them in water. He has now very ingeniously contrived to fix the other extreme, that of dryness: but this being producible only by means of throng fires, fuch as hygrometers cannot fupport, he uses an intermediate body, quicklime; which after having been deprived, by force of fire, of all its own humidity, has the property of flowly imbibing humidity again from the bodies in its neighbourhood; and whose capacity is such, that all the vapour that can be contained in a quantity of air equal to its own bulk, can give it no fenfible humidity. Thefe hygrometers, inclosed with a large quantity of fresh burnt lime in lumps, acquire in three weeks the fame degree of dryness with the lime, which cannot differ fentibly from extreme drynefs.

M. de Sauffure makes choice of hairs, prepared by maceration in alkaline lye. M. de Luc shows that hairs, and all other animal or vegetable substances, taken lengthous, or in the direction of their fibres, undergo contrary changes from different variations of humidity; it hat, when immerfed in water, they lengthen at first, and afterwards shorten; that when they are near the greatest degree of humidity; if the moisture is increased, they shorten themselves; if it is diminished, they lengthen themselves first before they contract again. These irregularities, which obviously render them incapable of being true measures of humidity, the shows to be the necessary confequence of their organic reticular structure.

M. de Sauffure takes his point of extreme moifture from the vapours of water under a glass bell, keeping the fides of the bell continually moistened: and affirms, that the humidity is there constantly the same in all temperatures; the vapours even of boiling water having no more effect than those of cold. M. de Luc shows, on the contrary, that the differences of humidity under the bell are very great, though M. Sauffure's hygrometer was incapable of discovering them; and that the real undecomposed vapour of boiling water has the directly opposite effect to that of cold, the effect of extreme dryness: and on this point he mentions an interesting fact, communicated to him by Mr Watt, viz. that wood cannot be employed in the iteam engine for any of those parts where the vapour of the boiling water is confined, because it dries

related, in which the imperfection of M. Sauffure's, hygrometer led him into falle conclusions respecting phanomena, and into erroncous theories to account for them.

III. On the third principle, namely, the alteration of the weight of certain substances by their attracting the moisture of the air, few attempts have been made, nor do they feem to have been attended with much fuccefs. Sponges dipped in a folution of alkaline falts, and fome kinds of paper, have been tried. These are sufpended to one end of a very accurate balance, and counterpoifed by weights at the other, and flow the degrees of moifture or dryness by the ascent or descent of one of the ends. But, befides that fuch kinds of hygrometers are deftitute of any fixed point from whence to begin their scale, they have another inconvenience (from which indeed Smeaton's is not free, and which has been found to render it erroneous), namely, that all faline fubftances are deftroyed by long continued exposure to the air in very small quantities, and therefore can only imbibe the moisture for a certain time. Oil of vitriol has therefore been recommended in preference to the alkaline or neutral falts (fee CHEMISTRY, nº 614.); and, indeed, for fuch as do not chuse to be at the trouble of constructing a hygrometer on the principles of Mr Smeaton or De Luc, this will probably be found the most easy and accurate. Fig. 11. represents an hygrometer of this kind. A is a fmall glass cup containing a small quantity of oil of vitriol, B an index counterpoifing it, and C the fcale; where it is plain, that as the oil of vitriol attracts the moisture of the air, the scale will descend, which will raife the index, and vice verfa. This liquid is exceedingly fenfible of the increase or decrease of moisture. A fingle grain, after its full increase, has varied its equilibrium fo fenfibly, that the tongue of a balance, only an inch and a half long, has described an arch one third of an inch in compass (which arch would have been almost three inches if the tongue had been one foot), even with fo small a quantity of liquor; confequently, if more liquor, expanded under a large furface, were used, a pair of scales might afford as nice an hygrometer as any kind yet invented .- A great inconvenience, however, is, that as the air must have full access to the liquid, it is impossible to keep out the duft, which, by continually adding its weight, must render the hygrometer false; add to this, that even oil of vitriol itself is by time destroyed, and changes its nature, if a small quantity of it is continually exposed to the air.

The best hygrometer upon this principle, and for afcertaining the quantity as well as the degree of moisture in the variation of the hygrometer, is of the contrivance of Mr Coventry, Southwark, London. The account he has favoured us with is as follows. " Take two sheets of fine tiffue paper, such as is used by hatters; dry them carefully at about two feet diffance from a tolerably good fire, till after repeatedly weighing them in a good pair of scales no moisture remains. When the sheets are in this perfectly dry state, reduce them to exactly 50 grains; the hygrometer is then fit for use. The sheets must be kept free from dust, and

Hygrome- to as to crack, just as if exposed to the fire. In M. de exposed a few minutes in the open air; after which it Hygrome-Luc's work above mentioned there are firiking inflances may be always known by weighing them the exact, quantity of moisture they have imbibed.

" For many years the hygrometer has (fays Mr Coventry) engroffed a confiderable share of my attention; and every advantage proposed by others, either as it respected the substances of which the instrument was composed, or the manner in which its operations were to be difcerned, has been impartially examined. But (adds he) I have never feen an hygrometer fo fimple in itself, or that would act with such certainty or fo equally alike, as the one I have now defcribed. The materials of which it is composed being thin, are easily deprived wholly of their moisture; which is a circumstance effentially necessary in fixing a datum from which to reckon, and which, I think, cannot be faid of any substance hitherto employed in the conflruction of hygrometers: with equal facility they imbibe or impart the bumidity of the atmosphere, and show with the greatest exactness when the least alteration takes place."

When the paper is prepared, as already described, it will ferve, without the trouble of drying, as a flandard for any number of sheets intended for the same purpofe. But then the sheets must be kept together in the open air for a few hours; because whatever alteration may take place by this exposure, the paper already weighed must have undergone the same; being confequently in the same state, they must be cut to the fame weight.

For easier weighing the paper, take a piece of round tin or brass the fize of a crown-piece, through the centre of which drill a hole, and also three others round it at equal diffances: then cut about one hundred papers; and after putting them under the tin or brafs, drive through each hole a strong pin into a board, in order to round them to the shape of the plate: the papers must be then separated and exposed to the air a few hours with that already weighed, and fo many of them taken as are equal to the weight already specified. This done, threadle them together through those holes made by the pins, putting between every paper on each thread a fmall bead, in order to prevent the papers from touching each other, and also that the air may be more readily admitted. The top of the hygrometer is covered with a card cut to the fame fize; and which, by reason of its stiffness, supports all the papers, and keeps them in proper shape. Before the papers are threaded, the beads, filk, card, and a thin piece of brass about the fize of a fixpence, which must be placed at the bottom, and through which the centre string passes, must be weighed with the greatest exactness, in order to bring them to a certain weight, suppose 50 grains; now the paper in its drieft flate being of equal weight, they will weigh together 100 grains, confequently what they weigh more at any time is moisture.

To obviate the trouble and difficulty of trying experiments with weights and scales, Mr Coventry contrived a machine or scale by which to determine at one view the humidity or dryness of the atmosphere. This, with its case, is represented by fig. 12. The front and back of the case are glass; the fides fine. gauze, which excludes the dust and admits the air : Hygrome the case is about 10 inches high, 8 inches broad, and , 4 inches deep. A, a brass bracket in front, behind TER. which, at about 3 inches distance, is another; these

and another which supports the stem B, to which the sufpended in the usual manner to the end of a beam the Rhyndaeus, which runs north-west into the Pro-D, and weighing exactly 100 grains. This seale is an pontis. exact counterpoise to the papers I and the different axis of the beam g, which is made of brass, instead of beloved. hanging on pivots as in common fcales, turns with B may always be in a perpendicular fituation.

follows: To the end of the beam where the hygrometer is suspended, hang a weight of 100 grains, which is equal to the weight of the scale; then move the fliding weight F up or down the index E, till one also Physicus, (Cicero, De Nat. Deor. lib. i. cap. 13.) grain will cause the index to traverse neither more nor grain to the fcale, in order to bring the index to o; and the instrument, after taking off the 100 grain sophers were Hylopathians, or ANAXIMANDRIANS, deweight and hanging on the papers, is fit for use; then put grain weights in the fcale till the index is brought within compass of the scale of divisions. Example: H is 3 grains on the brass scale, and the index points tical system, who ascribe the production of the universe at 10; confequently there is 3 grains and 10 hun- to atoms and figures. See on this subject Cudworth's dredths of a grain of moisture in the papers. If four Intellectual System, book i chap. 3. grain-weights are kept, viz. 1, 2, 4, and 5, they will make any number from 1 to 9, which are as many as will be wanted. Sometimes the index will continue traverfing within the scale of divisions for many days without shifting the weights; but if otherwise, they

must be changed as occasion may require. "One great advantage of this hygrometer above all others that have attracted my notice is (fays Mr Coventry), that it acts from a certain datum, namely, the dry-extreme; from which all the variations towards moift are calculated with certainty; and if constructed with that precision represented by the drawing, it will afford pleasure to the curious in observing the almost perpetual alteration of the atmosphere, even in the most fettled weather. In winter it will be constantly traverling from about eight in the morning till four or five in the afternoon, towards dry; and in fummer, from about four in the morning till fix or feven in the Christians, during the first ages of the church, as apevening, when the weather is hot and gloomy, the hygrometer discovers a very great change towards Coronant & nupta sponfos .- S. Chrysostom likewise moisture; and when clear and frosty, that it contains mentions these crowns of flowers; and to this day the a much greater quantity of moisture than is generally Greeks call marriage convex, in respect of this crown imagined."

Nº 161.

HYGROSCOPE. The same with HYGROME-Hygrony

HYLA (anc. geog.), a river of Mysia Minor, fafupport the axis of the index E, also of the beam D, mous for Hylas the favourite boy of Hercules, who was carried down the stream and drowned. It is faid ivory scale of divisions C is fixed. G, a brass scale to run by Prusa; whence it seems to be the same with

HYLAS, in fabulous history, fon of Theodamus, apparatus. The particular manner of fuspension in was ravished by the nymphs of a fountain as he was this balance is, from the construction, as follows: The taking out fome water for Hercules, by whom he was

HYLOZOISTS, formed of whn matter, You life, the two fleel edges k k, fixed in the extremities of the brafs name of a feet of atheifts among the ancient Greek axis: these edges are shaped like the edge of a knife, philosophers, who held matter to be animated; mainand act on two steel concave edges 11, in order to rentaining that matter had some natural perception, with-der the friction as small as possible. D is a fine scale out animal sensation, or reflection in itself considered; beam fixed at right angles with the axis g. E, the but that this imperfect life occasioned that organizafteel index fixed to the under fide of the fame axis. tion whence fenfation and reflection afterwards arofe. F, a brafs fliding weight: b is the axis that holds the Of thefe, fome held only one life, which they called a ftem B to which the scale of divisions C is fixed. AA, PLASTIC nature, presiding regularly and invariably over the brass brackets which support the whole by four the whole corporeal universe, which they represented as fcrews, two of which are feen at ii, that fcrew the a kind of large plant or vegetable; thefe were called the brackets to the top of the case. The axis of the cosmoplastic and stoical atheists, because the Stoics feale of divisions is hung on pivots, one of which is held such a nature, though many of them supposed it feen at m, that, should the case not stand level, the stem to be the instrument of the Deity. Others thought that every particle of matter was endued with life, and The hygrometer, before use, should be adjusted as made the mundane system to depend upon a certain mixture of chance and plastic or orderly nature united together. These were called the Stratonici, from Strato Lampfacenus, a disciple of Theophrastus, called who was first a celebrated Peripatetic, and afterwards less than the whole scale of divisions; then add half a formed this new system of atheism for himself. Besides these two forms of atheism, some of the ancient philoriving all things from dead and stupid matter, in the way of qualities and forms, generable and corruptible ; and others again adopted the ATOMICAL or Democri-

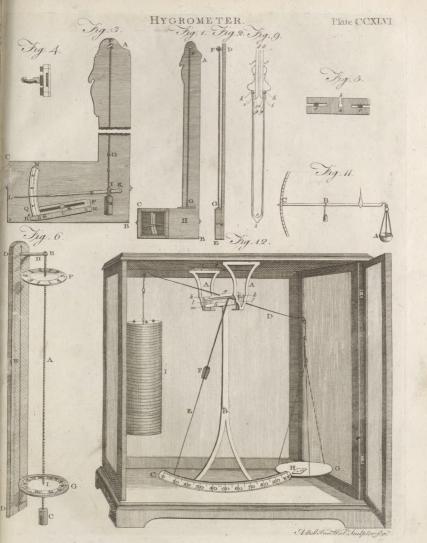

HYMEN, or HYMENÆUS, a fabulous divinity, the fon of Bacchus and Venas Urasia, was supposed by the ancients to prefide over marriages; and accordingly was invoked in epithalamiums, and other matrimonial ceremonies, under the formula, Hymen,

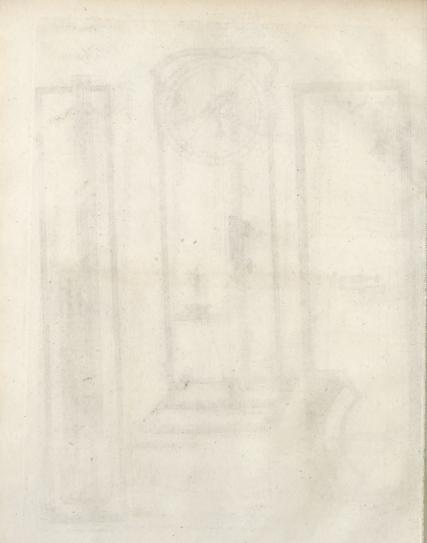

or Hymenæe!

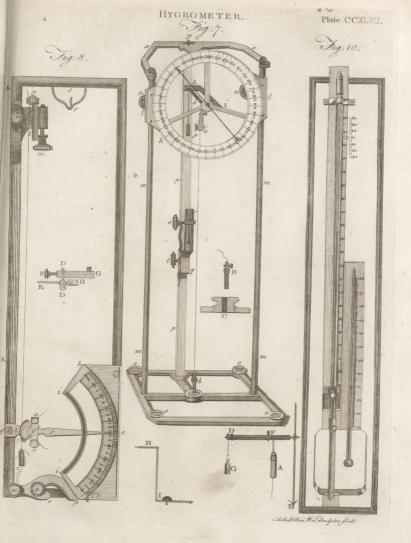

The poets generally crown this deity with a chaplet of rofes; and reprefent him, as it were, dissolved and enervated with pleasures; dressed in a yellow robe, and shoes of the same colour; with a torch in his hand .- Catullus, in one of his epigrams, addresses him thus :

Cinge tempora floribus, Sugveolentis amaraci.

It was for this reason, that the new-married couple bore garlands of flowers on the wedding-day: which cuftom also obtained among the Hebrews, and even among pears from Tertullian, De corona militari, where he fays, or garland. HYMEN,

fmooth, and fometimes semilunar, formed by the union of the internal membrane of the great canal with that on the infide of the alæ, refembling a piece of fine parchment. This membrane is supposed to be stretched in the neck of the womb of virgins, below the nymphæ, leaving in fome fubjects a very fmall opening, in others a larger, and in all rendering the external orifice narrower than the rest of the cavity, and to be broke when they are deflowered; an effusion of blood following the breach.

This membranous circle may likewife fuffer fome diforder by too great a flux of the menses, by impru-

dence, levity, and other particular accidents.

The hymen is generally looked upon as the test of virginity; and when broke, or withdrawn, shows that the person is not in a state of innocence. This notion is very ancient. Among the Hebrews, it was the cuffom for the parents to fave the blood shed on this occasion as a token of the virginity of their daughter, and to fend the sheets next day to the husband's relations. And the like is faid to be still practifed in Portugal, and fome other countries.

And yet authors are not agreed as to the existence of fuch a membrane. Nothing, Dr Drake observes, has employed the curiofity of anatomists, in diffecting the organs of generation in women, more than this part : they have differed not only as to its figure, fubstance, place, and perforation, but even its reality; fome politively affirming, and others flatly denying it.

De Graaf himfelf, the most accurate inquirer into the ftructure of these organs, confesses he always sought it in vain, though in the most unsuspected subjects and ages: all he could find was, a different degree of straitness or wideness, and different corrugations, which were greater or less according to the respective ages; the aperture being still the less, and the rugosities the greater, as the subject was younger and more un-

Dr Drake, on the other hand, declares, that in all the fubjects he had opportunity to examine, he does not remember to have miffed the hymen fo much as once, where he had reason to depend on finding it. The fairest view he ever had of it was in a maid who died at thirty years of age; in this he found it a membrane of fome strength, furnished with fleshy fibres, in figure round, and perforated in the middle with a small hole, capable of admitting the end of a woman's little finger, and ficuated a little above the orifice of the urinary paffage, at the entrance of the vagina of the womb.

In infants, it is a finethin membrane, not very confpicuous, because of the natural straitness of the passage itfelf, which does not admit of any great expansion in so little room; which might lead De Graaf into a notion

of its being no more than a corrugation.

This membrane, like most others, does probably grow more diffinet, as well as firm, by age. That it of fome deity .- The word is Greek, veve hymn, not only exists, but is sometimes very strong and im- formed of the verb vsw celebro, "I celebrate."-Isiopervious, may be collected from the history of a case dore, on this word, remarks, that hymn is properreported by Mi Cowper. In a married woman, twenty ly a fong of joy, full of the praifes of God : by years of age, whose hymen was found altogether imper- which, according to him, it is distinguished from vious, fo as to detain the menses, and to be driven out threna, which is a mourning song, full of lamentaby the preffure thereof beyond the labia of the puden- tion. dum, not unlike a prolapius of the uterus; on divi-

Vol. IX. Part. I.

HYMEN, TANN, in anatomy, a thin membrane or fkin, ding it, at least a gallon of grumous blood came forth. Hymenex fometimes circular, of different breadths, more or less It feems the husband, being denied a passage that way, had found another through the meatus urinarius; which was found very open, and its fides extruded like the anus of a cock.

Upon a rupture of the hymen, after the confummation of marriage, and especially delivery, its parts, fhrinking up, are supposed to form those little fleshy

knots, called CARUNCULE myrtiformes.

HYMENÆA, the BASTARD LOCUST TREE: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 33d order, Lomentacea. The calyx is quinquepartite; there are five petals, nearly equal; the ftyle is intorted; the legumen full of meally pulp. There is but one species, the courbaril, which is a large tree, growing naturally in the Spanish West Indies. The trunk is covered with a light ash-coloured bark, is often more than 60 feet high and three in diameter. The branches are furnished with dark green leaves, which fland by pairs on one common footflalk, diverging from their base in manner of a pair of shears when opened. The flowers come out in loofe spikes at the ends of the branches, and are yellow, firiped with purple. Each confifts of five petals, placed in a double calyx, the outer leaf of which is divided into five parts, and the inner one is cut into five teeth at its brim. In the centre are ten declining stamina, longer than the petals, furrounding an oblong germen, which becomes a thick, fleshy, brown pod, four or five inches long and one broad, with a future on both edges, and includes three or four purplish feeds. fomewhat of the shape of Windsor beans, but smaller, The feeds are covered with a light brown fugary fubflance, which the Indians fcrape off and eat with great avidity, and which is very pleafant and agreeable .-At the principal roots under ground, is found collected in large lumps a yellowish-red transparent gumwhich diffolved in rectified spirit of wine affords a most excellent varnish, and is the gum anime of the shops. HYMENÆAL, fomething belonging to marriage;

fo called from HYMEN.

HYMENOPTERA (derived from venv membrane, and wregov wing), in the Linnwan fystem of natural history, is an order of infects, having four membranaceous wings, and the tails of the females are furnished with ftings, which in fome are used for inftilling poifon, and in others for merely piercing the bark and leaves of trees, and the bodies of other animals, in which they deposit their eggs.

HYMETTUS (anc. geog.), a mountain of Attica near Athens, famous for its marble quarries, and for its excellent honey. Hymettius the epithet. Pliny fays that the orator Craffus was the first who had

marble columns from this place.

HYMN, a fong or ode in honour of God; or a poem, proper to be fung, composed in honour

St Hilary, bishop of Poictiers, is said to have been

Hyo-thy and was followed by St Ambrose. Most of those in the Roman Breviary were composed by Prudentius. They have been translated into French verse by Messieurs de Port Royal .- In the Greek Liturgy there are four kinds of hymns; but the word is not taken in the fense of a praise offered in verse, but fimply of a laud or praise. The angelic hymn, or Gloria in excelsis, makes the first kind; the trisagion the fecond; the Cherubic hymn, the third; and the hymn of victory and triumph called trivial, the last.

The hymns or odes of the ancients generally confifted of three forts of ftanzas; one of which, called Arophè, was fung by the band as they walked from east to west; another, called antistrophe, was performed as they returned from weft to east; the third part, or epode, was fung before the altar. The Jewish hymns were accompanied with trumpets, drums, and cymbals, to affift the voices of the Levites and people.

HYOBANCHE, in botany: A genus of the angiofpermia order, belonging to the didynamia class of plants. The calyx is heptaphyllous; the corolla ringent, with no under lip. The capfule bilocular, and polyspermous.

HYOIDES, in anatomy, a bone placed at the root of the tongue. See ANATOMY, no 28.

HYOSCYAMUS, HENBANE: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 28th order, Luride. The corolla is funnel-shaped and obtuse; the stamina inclining to one side; the capsule covered and bilocular. There are feveral species, one of which, viz. the niger, or common henbane, is a native of Britain. It grows on road-fides, and among rubbish. It is a biennial plant, with long fleshy roots which strike deep into the ground, fending out feveral large foft leaves, deeply flashed on their edges; the following fpring the stalks come up, which are about two feet high, garnished with flowers standing on one fide in a double row, fitting close to the stalks alternately. They are of a dark purplish colour, with a black bottom; and are fucceeded by roundish capfules which open with a lid at the top, and have two cells filled with fmall irregular feeds .- The feeds, leaves, and roots of this plant, as well as of all other fpecies of this genus, are poisonous: and many well attested inflances of their bad effects are recorded; madnefs, convultions, and death, being the common confequence. In a smaller dose, they occasion giddiness and stupor. It is said that the leaves scattered about a house will drive away mice .- The juice of the plant evaporated to an extract is prescribed in some cases as a narcotic; in which respect undoubtedly it may be a powerful medicine if properly managed. The dose is from half a scruple to half a dram. The roots are used for anodyne necklaces .- Goats are not fond of the plant; horses, cows, sheep, and swine, refuse it.

HYOSERIS, in botany : A genus of the polygamia æqualis order, belonging to the fyngenefia class of plants; and in the natural method ranking under the 49th order, Composita. The receptacle is naked, the calyx nearly equal; the pappus hairy, or scarce perceptible.

Hyobanche the first that composed hymns to be sung in churches, muscles belonging to the os hyoides. See Anaromy, Hypallage Table of the Muscles.

HYPALLAGE, among grammarians, a species of hyperbaton, confisting in a mutual permutation of one case for another. Thus Virgil says, Dare classibus austros, for dare classes austris; and again, Necdum illis labra admovi, for necdum illa labris admovi.

HYPANTE, or HYPERPANTE, a name given by the Greeks to the feast of the presentation of Jesus in the temple .- This word, which fignifies lowly or bumble meeting, was given to this feaft from the meeting of old Simeon and Anna the prophetess in the

temple when Jefus was brought thither.

HYPATIA, a learned and beautiful lady of antiquity, the daughter of Theon a celebrated philosopher and mathematician, and prefident of the famous Alexandrian school, was born at Alexandria about the end of the fourth century. Her father, encouraged by her extraordinary genius, had her not only educated in all the ordinary qualifications of her fex, but instructed in the most abstruse sciences. She made such great progress in philosophy, geometry, astronomy, and the mathematics, that she passed for the most learned person of her time. At length fhe was thought worthy to fucceed her father in that diftinguished and important employment, the government of the school of Alexandria; and to teach out of that chair where Ammonius, Hierocles, and many other great men, had taught before; and this at a time too when men of great learning abounded both at Alexandria and in many other parts of the Roman empire. Her fame was fo extensive, and her worth fo univerfally acknowledged, that we cannot wonder if she had a crowded auditory. " She explained to her hearers (fays Socrates) the feveral fciences that go under the general name of philosophy; for which reason there was a confluence to her, from all parts, of those who made philosophy their delight and fludy." One cannot represent to himself without pleafure, the flower of all the youth of Europe, Afia, and Africa, fitting at the feet of a very beautiful lady (for fuch we are affured Hypatia was), all greedily fwallowing inftruction from her mouth, and many of them, doubtlefs, love from her eyes; though we are not fure that she ever listened to any folicitations, fince Suidas, who talks of her marriage with Isodorus, yet relates at the fame time that she died a maid.

Her fcholars were as eminent as they were numerous; one of whom was the celebrated Synchus, who. was afterwards bishop of Ptolemais. This ancient Christian Platonist every where bears the strongest, as well as the most grateful, testimony of the virtue of his tutoress; and never mentions her without the most profound respect, and sometimes in terms of affection coming little fhort of adoration. But it was not Synefius only, and the disciples of the Alexandrian school, who admired Hypatia for her virtue and learning; never was woman more careffed by the public, and yet never woman had a more unspotted character. She was held as an oracle for her wisdom, which made her confulted by the magistrates in all important cases; and this frequently drew her among the greatest concourse of men, without the least censure of her manners. In a word, when Nicephorus intended to pass the HYO-THYROIDES, in anatomy, one of the highest compliment on the princess Eudocia, he

though

Hypatia thought he could not do it better than by calling her another Hypatia.

Hyper-

baton.

While Hypatia thus reigned the brightest ornament of Alexandria, Orestes was governor of the fame place for the emperor Theodofius, and Cyril was bishop or patriarch. Orestes having had a liberal education, could not but admire Hypatia; and as a wife governor frequently confulted her. This, together with an aversion which Cyril had against Orestes, proved fatal to the lady. About 500 monks affembling, attacked the governor one day, and would have killed him, had he not been refcued by the townsmen; and the respect which Orestes had for Hypatia caufing her to be traduced among the Christian multitude, they dragged her from her chair, tore her to pieces, and burned her limbs. Cyril is not clear from a fufpicion of fomenting this tragedy. Cave indeed endeavours to remove the imputation of fuch an horrid action from the patriarch; and lays it upon the Alexandrian mob in general, whom he calls levissimum hominum genus, " a very trifling inconstant people." But though Cyril should be allowed neither to have been the perpetrator, nor even the contriver of it, yet it is much to be suspected that he did not discountenance it in the manner he ought to have done: which fuspicion must needs be greatly confirmed by reflecting, that he was fo far from blaming the outrage committed by the monks upon Orestes, that he afterwards received the dead body of Ammonius, one of the most forward in that outrage, who had grievously wounded the governor, and who was justly punished with death. Upon this riotous rushan Cyril made a panegyric in the church where he was laid, in which he extolled his courage and conftancy, as one that had contended for the truth; and changing his name to Thaumasius, or the "Admirable," ordered him to be confidered as a martyr. " However, (continues Socrates), the wifeft part of Christians did not approve the zeal which Cyril showed on this man's behalf, being convinced that Ammonius had juftly fuffered for his desperate attempt."

HYPECOUM, WILD CUMIN: A genus of the digynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 24th order, Corydales. The calyx is diphyllous; the petals four; the exterior two larger and trifid; the fruit a pod. There are four species, all of them low herbace-ous planes with yellow flowers. The juice of these plants is of a yellow colour, refembling that of celandine, and is affirmed by fome eminent phyficians to be as narcotic as opium. From the nectarium of the bloffom the bees collect great quantities of honey. All the species are easily propagated by seeds.

HYPER, a Greek preposition frequently used in composition, where it denotes excess; its literal fignisi-

cation being above, or beyond.

HYPERBATON, in grammar, a figurative construction inverting the natural and proper order of words and fentences. The feveral species of the hyperbaton are, the anastrophe, the hysteron-proteron, the hypallage, fynchyfis, tmefis, parenthefis, and the hyperbaton firictly fo called. See ANASTROPHE, &c.

HYPERBATON, firictly to called, is a long retention

of the verb which completes the fentence, as in the fol- Hyperbola. Hyperbole. lowing example from Virgil:

Interea Reges : ingenti mole Latinus Quadrijugo vehitur curru, cui tempora circum Aurati bis fex radii fulgentia cingunt, Solis avi Specimen : bigis it Turnus in albis, Bina manu lato crispans hastilia ferro: Hinc Pater Æneas, Romana stirpis origo, Sidereo flagrans clypeo et celestibus armis ; Et juxta Ascanius, magna spes altera Rome : Procedunt castris.

HYPERBOLA, a curve formed by cutting a cone in a direction parallel to its axis. See Conic-

HYPERBOLE, in rhetoric, a figure, whereby the truth and reality of things are exceffively either enlarged or diminished. See ORATORY, nº 58.

An object uncommon with respect to fize, either Elements of very great of its kind or very little, ftrikes us with Critici/mfurprise; and this emotion forces upon the mind a momentary conviction that the object is greater or less than it is in reality: the same effect, precisely, attends figurative grandeur or littleness; and hence the hyperbole, which expresses this momentary conviction. A writer, taking advantage of this natural delufion, enriches his description greatly by the hyperbole : and the reader, even in his coolest moments, relishes this figure, being fensible that it is the operation of nature upon a warm fancy.

It cannot have escaped observation that a writer is generally more fuccefsful in magnifying by a hyperbole than in diminishing. The reason is, that a minute object contracts the mind, and fetters its powers of imagination; but that the mind, dilated and inflamed with a grand object, moulds objects for its gratification with great facility. Longinus, with respect to a diminishing hyperbole, cites the following ludicrous thought from a comic poet: "He was owner of a bit of ground not larger than a Lacedemonian letter." But, for the reason now given, the hyperbole has by far the greater force in magnifying objects; of which take the following examples:

For all the land which thou feeft, to thee will I give it, and to thy feed for ever. And I will make thy feed as the dust of the earth : fo that if a man can number the dust of the earth, then shall thy feed also be numbered. Gen. xiii, 15. 16.

Illa vel intactæ fegetis per fumma volaret Gramina: nec teneras curfu læfiffet ariftas. Æneid. vii. 808.

-Atque imo barathri ter gurgite vastos Sorbet in abruptum fluctus, rursusque sub auras Erigit alternos, et fidera verberat unda. Æneid. iii. 421.

-Horrificis juxta tonat Ætna ruinis, Interdumque atram prorumpit ad æthera nubem, Turbine fumantem piceo et candente favilla: Attollitque globos flammarum, et sidera lambit. Eneid. iii. 571.

Speaking of Polyphemus,

--- Ipfe arduus, altaque pulfat Eneid. iii. 619. -When Hyperbole.

The air, a charter'd libertine, is still.

Henry V. act 1. sc. 1.

Now fhield with fhield, with helmet helmet clos'd, To armour armour, lauce to lance oppos'd, Hoft against hoft with fhadowy fquadrons drew, The founding darts in iron tempells flew, Victors and vanquin'd join promiteuous cries, And fhrilling fhouts and dying groans arife; With streaming blood the slipp'ry fields are dy'd, And flaughter'd heroes swell the dreasful tide.

Iliad iv. 508.

Quintilian is fensible that this figure is natural: " For (fays he), not contented with truth, we naturally incline to augment or diminish beyond it; and for that reason the hyperbole is familiar even among the vulgar and illiterate :" and he adds, very juftly, "That the hyperbole is then proper, when the object of itself exceeds the common measure." From these premises, one would not expect the following inference, the only reason he can find for justifying this figure of speech, "Conceditur enim amplius dicere, quia dici quantum eft, non potest : meliusque ultra quam citra stat oratio." (We are indulged to say more than enough, because we cannot fay enough; and it is better to be above than under.) In the name of wonder, why this flight and childish reasoning, when immediately before he had observed, that the hyperbole is founded on human nature? We could not refift this personal flroke of criticism; intended not against our author, for no human creature is exempt from error; but against the blind veneration that is paid to the ancient classic writers, without distinguishing their blemishes from their beauties.

Having examined the nature of this figure, and the principle on which it is exceled; let us proceed to the rule by which it oughtto be governed. And, in the first place, it is a capital fault to introduce an hyperbole in the defeription of an ordinary object or event; for in fuch a cafe, it is altogether unnatural, being defluture of furprife, its only foundation. Take the following inflance, where the fubject is extremely familiar, viz. ferimining to gain the flore after a flip-familiar, viz. (wimming to gain the flore after a flip-

Jammai

I faw him beat the furges under him,
And ride upon their backs: he trod the water;
Whose enmity he flung aside, and breasted
'The furge most swoln that met him: his bold head
'Bove the contentious waves he kept, and oar'd
Himself with his good arms, in lusty strokes
To th' fbore, that o'er his wave-born basis bow'd,
As stooping to relieve him.

Tempes, ast 2. fc. 1.

In the next place, it may be gathered from what is faid, that an hyperbole can never fuit the tone of any dispiriting paffion: forrow in particular will never prompt such a figure, and for that reason the following hyperboles must be condemned as unnatural:

K. Rich. Aumerle, thou weep'st, my tenderhearted cousin!
We'll make foul weather with despised tears;
Our sighs, and they, shall lodge the summer-corn,
And make a dearth in this revolving land.

Richard II. att 3. fc. 6.

Draw them to Tyber's bank, and weep your tears
Into the channel, till the lowest stream
Do kiss the most exalted shores of all.

Julius Cafar, all 1. fc. 1.

Thirdly, A writer, if he wish to succeed, ought always to have the reader in his eye: he ought, in particular, never to venture a bold thought or expression, till the reader be warmed and prepared. For this reason, an hyperbole in the beginning of a work can never be in its place. Example:

Jam pauca aratro jugera regiæ
Moles relinquent. Horat. Carm. lib. 2. ode 15.

In the fourth place, The nicest point of all, is to afcertain the natural limits of an hyperbole, beyond which being overlirained, it has a bad effect. Longinus (chap. iii.), with great propriety of thought, enters a caveat against an hyperbole of this kind; he compares it to a bow-string, which relaxes by overstraining, and produceth an effect directly opposite to what is intended. To ascertain any precise boundary, would be difficult, if not impracticable. We shall therefore only give a specimen of what may be reckned overstrained hyperboles. No fault is more common among writers of inferior rank; and instances are sound even among those of the finest taste; witness the following hyperbole, too bold even for an Hotspur.

Hotfpur talking of Mortimer:

In fingle opposition hand to hand, He did confound the best part of an hour In changing hardiment with great Glendower. Three times they breath'd, and three times did they

drink,
Upon agreement, of fwift Severn's flood;
Who then affrighted with their bloody looks,
Ran fearfully among the trembling reeds,
And hid his crifp'd head in the hollow bank,
Blood-flained with thefe valiant combatants.

Frift Part Harry IV. 46 1 . fc. 4.

England ne'er had a King until his time.

Speaking of Henry V.

Virtue le had, deferving to command: His brandifu'd fword did blind men with its beams: His arms fpread wider than a dragon's wings: His fparkling eyes, replete with awful fire, More dazzled, and drove back his enemies, Than mid-day fun fierce bent againft their faces. What fhould I fay? his deede sexceed all fpeech:

He never lifted up his hand, but conquer'd.

First Part Henry VI. act 1. sc. 1.

Lastly, An hyperbole, after it is introduced with

Latty, Am hyperoote, atter it is introduced with all advantages, ought to be comprehended within the feweft words possible: as it cannot be relished but in the hurry and swelling of the mind, a leifurely view difficies the charm, and discovers the description to be extrawagant at least, and perhaps also ridiculous. This fault is palpable in a sonnet which passite h for one of the most complete in the French language: Phillis, inalong and shorld description, is made as far to outstine the fun as he outshine the sine as he outside the state.

Le filence regnoit fur la terre et fur l'onde, L'air devenoit ferain et l'Olimp vermeil, Hyper -

Et l'amourex Zephir affranchi du someil, Reffuscitoit les fleurs d'une haleine feconde.

L'Aurore deployoit l'or de sa tresse blonde, Eet semoit de rubis le chemin du soleil; Enfin ce Dieu venoit au plus grand appareil Qu'il foit jamais venu pour eclairer le monde :

Quand la jeune Philis au visage riant, Sortant de son palais plus clair que l'orient, Fit voir une lumiere et plus vive et plus belle.

Sacre Flambeau du jour, n'en foiez point jaloux, Vous parutes alors auffi peu devant elle, Que les feux de la nuit avoient fait devant vous. Malleville.

There is in Chaucer a thought expressed in a single line, which fets a young beauty in a more advantageous light than the whole of this much laboured poem:

Up rose the sun, and up rose Emelie.

HYPERBOREAN, in the ancient geography. The ancients denominated those people and places Hyperborean which were to the northward of the Scythians. They had but very little acquaintance with these Hyperborean regions; and all they tell us of them is very precarious, much of it false. Diodorus Siculus fays, the Hyperboreans were thus called by reason they dwelt beyond the wind Boreas; vare fignifying "above, or beyond," and Bopeas, Boreas, the "north wind." This etymology is very natural and plaufible; notwithstanding all that Rudbeck has faid against it, who would have the word to be Gothic, and to fignify nobility. Herodotus doubts whether or no there were any fuch nations as the Hyperborean. Strabo, who professes that he believes there are, does not take hyperborean to fignify beyond Boreas or the north, as Herodotus understood it: the prepofition unio, in this case, he supposes only to help to form a superlative; so that byperborean, on his principle, means no more than most northern: by which it appears the ancients fcarce knew themselves what the name meant .- Most of our modern geographers, as Hoffman, Cellarius, &c. have placed the Hyperboreans in the northern parts of the European continent, among the Siberians and Samoieds: according to them, the Hyperboreans of the ancients were those in general who lived farthest to the north. The Hyperboreans of our days are those Russians who inhabit between the Volga and the White fea. According to Cluvier, the name Celtes was fynonymous with that of Hy-

HYPERCATALECTIC, in the Greek and Latin poetry, is applied to a verse that has one or two fyllables too much, or beyond the regular and just measure ; as,

Musa sorores funt Minerva: Alfo.

Muse Sorores Palladis lugent.

HYPERCRITIC, an over-rigid cenfor or critic: one who will let nothing pass, but animadverts fe-

yond;" and xerlexo, of xerles, judex, of xerva, judico, Hyperdulia 44 I judge."

HYPERDULIA, in the Romish theology, is the worship rendered to the holy virgin. The word is -Greek, υπερδυλεια, composed of υπερ, above, and suλια, worship, service. The worship offered to faints is called dulia; and that to the mother of God, byperdulia, as being superior to the former.

HYPERIA (anc. geog.) the feat of the Phæacians near the Cyclops, (Homer): some commentators take it to be Camarina in Sicily; but, according to others, is supposed to be an adjoining island, which they take to be Melita, lying in fight of Sicily. And this feems to be confirmed by Apollonius Rhodius. Whence the Phæacians afterwards removed to Corcyra, called Scheria, Pheacia, and Macris; having been expelled by the Phænicians, who fettled in Melita for commerce, and for commodious harbours, before the war of Troy. (Diodorus Siculus.)

HYPERICUM, ST JOHN'S WORT: A genus of the polyandria order, belonging to the polyadelphia class of plants; and in the natural method ranking under the 20th order, Rotacea. The calyx is quinquepartite; the petals five; the filaments many, and coalited at the base into five pencils; the seed-vessel is a pencil.

Species. Of this genus there are 29 species, most of them hardy deciduous shrubs, and under-shrubby plants, adorned with oblong and oval fimple foliage, and pentapetalous yellow flowers in clusters. most remarkable are, 1. The bircinum, or stinking St John's wort. This rifes three or four feet high, with feveral shrubby two-edged stalks from the root, branching by pairs opposite at every joint; oblong, oval, clofe-fitting opposite leaves; and at the ends of all the young flouts, clusters of yellow flowers. Of this there are three varieties; one with ftrong stalks, fix or eight feet high, broad leaves, and large flowers; the other with strong stalks, broad leaves, and without any difagreeable odour; the third hath variegated leaves. All these varieties are shrubby; and slower in June and July in fuch numerous clusters, that the shrubs appear covered with them; and produce abundance of feed in autumn. 2. The canarien-fis hath shrubby stalks, dividing and branching fix or feven feet high; oblong, close-fitting leaves by pairs; and, at the ends of the branches, clusters of yellow flowers appearing in June and July. 3. The ascyron, or dwarf American St John's-wort, hath spreading roots, fending up numerous, flender, fquare ftalks, a foot long; oval, fpear-shaped, close-sitting, smooth leaves by pairs opposite; and, at the end of the stalks, large yellow flowers. 4. The androfamum, commonly called tutfan, or park-leaves, hath an upright undershrubby stalk, two feet high, branching by pairs opposite; and at the ends of the stalks, clusters of small yellow flowers appearing in July and August, and fucceeded by roundish berry-like black capfules. This grows naturally in many parts of Britain. 5. The balearicum, or wart-leaved St John's-wort, is a native of Majorca; and hath a fhrubby stalk, branching two feet high, with reddish scarified branches, small oval leaves warted underneath, and large yellow flowers appearing great part of the year. 6. The monogynum, verely on the flightest fault. See CRITICISM. The or one flyled China hypericum, hath a shrubby purplish word is compounded of vare fuper, " over, above, be- flalk, about two feet high; oblong, fmooth, fliff, clofe-

Hypericum fitting leaves, of a shining green above, and white underneath; clusters of fmall yellow flowers, with co-Hypnotiloured cups, and only one ftyle, flowering the greatest

part of the year.

Culture. The four first species are hardy, and will grow in any foil or fituation; the three last must be potted, in order to have shelter in the green-house in winter. The two first species propagate very fast by fuckers, which are every year fent up plentifully from the root; and in autumn or fpring may be readily flipped off from the old plants with roots to each, or the whole plant may be taken up and divided into as many parts as there are fuckers and flips with roots, planting the ftrongest where they are to remain, and the weakest in nurfery-rows, where they are to remain a year in order to acquire strength. They may also be propagated by feeds fown in autumn, in a bed of common earth, in drills an inch deep. The other two hardy forts are also propagated by flipping the roots in autumn, or early in the fpring; and may likewife be raifed in great plenty from feeds. The three other species are propagated by layers and cuttings, planted in pots, and plunged in a hot bed.

Properties. The tutfan hath long held a place in the medicinal catalogues; but its uses are very much undetermined. The leaves given in fubstance are faid to destroy worms. By distillation they yield an essential oil. The flowers tinge spirits and oils of a fine purple colour. Cows, goats, and sheep, eat the plant; horses and swine refuse it. The dried plant boiled in water with alum, dyes yarn of a yellow colour; and the Swedes give a fine purple tinge to their spirits with

the flowers.

HYPERIDES, an orator of Greece, was the difciple of Plato and Isocrates, and governed the republic of Athens. He defended with great zeal and courage the liberties of Greece; but was put to death by Antipater's order, 322 B. C. He composed many orations, of which only one now remains. He was one of the

ten celebrated Greek orators.

HYPERMNESTRA, in fabulous history, one of the 50 daughters of Danaus king of Argos. She alone refused to obey the cruel order Danaus had given to all his daughters, to murder their husbands the first night of their marriage; and therefore faved the life of Lynceus, after she had made him promise not to violate her virginity. Danaus, enraged at her difobedience, confined her closely in prison, whence Lynceus delivered her some time after.

HYPERSARCOSIS, in medicine and furgery, an excess of flesh, or rather a fleshy excrescence, such as those generally rising upon the lips of wounds, &c.

HYPHEN, an accent or character in grammar, implying that two words are to be joined, or connected into one compound word, and marked thus -; as pre-established, five-leaved, &c. Hyphens also serve to connect the syllables of such words as are divided by the end of the line.

HYPNOTIC, in the materia medica, fuch medicines as any way produce fleep, whether called nar-

cotics, bypnotics, opiates, or foporifics.

HYPNOTICUS SERPENS, the Sleep-fnake, in zoology, the name of an East-Indian species of serpent, called by the Ceylonese nintipolong, a word importing the fame fenfe. It is of a deep blackish brown, varie-

gated with spots of white, and is a very fatal kind in Hypnum and its poifon; its bite always bringing on a fleep which ends in death. HYPNUM, FEATHER-MOSS, in botany: A genus -

of the natural order of musci, belonging to the cryptogamia class of plants. The antheræ is operculated, or covered with a lid; the calyptra fmooth; the filament lateral, and rifing out of a perichætium, or tuft of leaflets different from the other leaves of the plant. There are 46 species, all of them natives of Great Britain; none of them, however, have any remarkable property, except the proliferum and parietinum. The first is of a very fingular structure, one shoot growing out from the centre of another; the veil is yellow and fhining; the lid with a kind of long bill; the leaves not shining; fometimes of a yellowish, and sometimes of a deep green. This moss covers the surface of the earth in the thickest shades, through which the fun never shines, and where no other plant can grow. The fecond hath fhoots nearly flat and winged, undivided for a confiderable length, and the leaves fhining; but the old shoots do not branch into new ones as in the preceding species. It grows in woods and shady places: and, as well as the former, is used for filling up the chinks in wooden houses.

HYPO, a Greek particle, retained in the composition of divers words borrowed from that language; literally denoting under, beneath .- In which fense it

flands opposed to unit fupra, " above."

HYPOBOLE, or SUBJECTION, (from vwo, and Balla, I cast), in rhetoric, a figure; fo called, when several things are mentioned, that feem to make for the contrary fide, and each of them refuted in order. This figure, when complete, confifts of three parts; a propofition, an enumeration of particulars with their answer, and a conclusion. Thus Cicero, upon his return from banishment, vindicates his conduct in withdrawing fo quietly, and not opposing the faction that ejected him, See ORATORY, nº 81.

HYPOCATHARSIS (compounded of uno under, and xasaipa I purge), in medicine, a too faint or feeble

purgation.

HYPOCAUSTUM, among the Greeks and Romans, a fubterraneous place, where was a furnace to heat the baths. The word is Greek, formed of the preposition uno under; and the verb xxia, to burn .-Another fort of hypocaustum was a kind of kiln to heat their winter parlours. The remains of a Roman hypocaustum, or sweating room, were discovered un-der ground at Lincoln in 1739. We have an account of these remains in the Philosophical Transactions. nº 461. 6 29 .- Among the moderns, the hypocauftum is that place where the fire is kept which warms a flove or hot-house.

HYPOCHÆRIS, HAWK'S-EYE, in botany : A genus of the polygamia æqualis order, belonging to the fyngenefia class of plants; and in the natural method ranking under the 49th order, Composita. The receptacle is paleaceous; the calyx a little imbricated; the pappus glumy. There are four species; none of which have any remarkable property, except the maculata, or spotted kawk's-eye. It is a native of Britain, and grows on high grounds. The leaves are oblong, eggfhaped, and toothed; the ftem almost naked, generally with a fingle branch; the bloffoms yellow, opening at Hypochon- fix in the morning, and clofing at four in the afternoon. The leaves are boiled and eaten like cabbage. Horses are fond of this plant when green, but not when Hypofcedry. Cows, goats, and swine eat it; sheep are not fond

of it. HYPOCHONDRIA, in anatomy, a space on each fide the epigastric region, or upper part of the abdo-

men. See ANATOMY, nº 88. HYPOCHONDRIAC PASSION, a difease in men, fimilar to the hyfteric affection in women. See (the

Index subjoined to) MEDICINE.

HYPOCISTIS, in the materia medica, an inspiffated juice obtained from the feffile afarum, much refembling the true Egyptian acacia. They gather the fruit while unripe, and express the juice, which they revaporate over a very gentle fire, to the confiftence of an extract, and then form into cakes, and expose them to the fun to dry. It is an aftringent of confiderable power; is good against diarrhœas and hæmorrhages of all kinds; and may be used in redellent gargarisms in the manner of the true acacia; but it is very rarely met with genuine in our shops, the German acacia being usually fold under its name.

HYPOCRISY, UMOXPIGIC, in ethics, denotes diffimulation with regard to the moral or religious character. In other words, it fignifies one who feigns to be what he is not; and is generally applied to those who assume the appearances of virtue or religion, without having

any thing in reality of either.

HYPOGÆUM, υπογιιον, formed of υπο under, and yaia earth, in the ancient architecture, is a name common to all the parts of a building that are under ground; as the cellar, butteries, and the like places. The term bypogeum was used by the Greeks and Romans for fubterraneous tombs in which they buried their

HYPOGEUM, Txolacov, in aftrology, is a name given to the celestial houses which are below the horizon: and especially the imum cali, or bottom of heaven.

HYPOGASTRIC, an appellation given to the in-

ternal branch of the iliac artery.

HYPOGASTRIUM, in anatomy, the middle part of the lower region of the belly. See ANATOMY,

HYPOGLOSSI, EXTERNI, OF MAJORES, in anatomy, the ninth pair of nerves, called also linguales & gustato-

rii. See Anatomy, p. 760. col. 1.

HYPOGLOTTIS, or Hypoglossis, (composed of υπο under, and γλωτία tongue), in anatomy, is a name given to two glands of the tongue. There are four large glands of the tongue; two of them called bypoglottides, fituated under it, near the venæ ranulares; one on each fide of the tongue. They ferve to filtrate a kind of ferous matter of the nature of faliva, which they discharge into the mouth by little ducts near the

HYPOGLOTTIS, or Hypogloffis, in medicine, denotes an inflammation or ulceration under the tongue; called

also ranula, HYPOPYON, in medicine, a collection of purulent

matter under the corner of the eye.

HYPOSCENIUM, in antiquity, a partition under the pulpit or logeum of the Greek theatre, appointed for the mulic.

HYPOSTASIS, a Greek term, literally fignifying Hypoftafa fubflance, or fubfiflence; used in theology for perfon.

The word is Greek, v*vocaous; compounded of *** fub, " under ;" and ssnus, Ao, existo; " I stand, I exist;" q. d. fub fifentia. Thus we hold, that there is but one nature or effence in God, but three hypoftafes or

The term bypostasis is of a very ancient standing in the church. St Cyril repeats it feveral times, as also the phrase union according to hypoflasis. The first time it occurs is in a letter from that father to Nestorius, where he uses it instead of προσωπον, the word we commonly render perfon, which did not feem expressive enough. "The philosophers (fays St Cyril) have allowed three hypoftafes: They have extended the Divinity to three hypoflafes: They have even fometimes used the word trinity: And nothing was wanting but to have admitted the confubfiantiality of the three bypoflafes, to flow the unity of the divine nature, exclufive of all triplicity in respect of distinction of nature, and not to hold it necessary to conceive any respective inferiority of bypoftafes."

This term occasioned great diffentions in the ancient church; first a mong the Greeks, and afterwards alfo among the Latins. In the council of Nice, hypoflafis was defined to denote the same with effence or subflance; fo that it was herefy to fay that Jesus Christ was of a different byposlasis from the Father; but custom altered its meaning. In the necessity they were under of expreffing themselves strongly against the Sabellians, the Greeks made choice of the word hypoflafis, and the Latins of persona; which change proved the occasion of endless disagreement. The phrase TPIIS UNOS MOEIS, used by the Greeks, fcandalized the Latins, whose usual way of rendering vπος ασις in their language was by fubfiantia. The barrenness of the Latin tongue in theological phrases, allowed them but one word for the two Greek ones, wora and wwosaors; and thus difabled them from diftinguishing effence from hypoflasis. For which reason they chose rather to use the term tres persone, and tres hypostases .- An end was put to logomachias, in a fynod held at Alexandria about the year 362, at which St Athanasius assisted; from which time the Latins made no great fcruple of faying tres bypoflafes, nor the Greeks of three persons.

HYPOTHECA, in the civil law, an obligation, whereby the effects of a debtor are made over to his creditor, to fecure his debt. The word comes from the Greek verbnar, a thing fubject to fome obligation; of the verb vwolitnuxi, supponor, "I am subjected;" of vwo

under, and Tignes pono, " I put."

As the hypotheca is an engagement procured on purpose for the security of the creditor, various means have been made use of to secure to him the benefit of the convention. The use of the pawn or pledge is the most ancient, which is almost the same thing with the hypotheca; all the difference confifting in this, that the pledge is put into the creditor's hands; whereas, in a fimple hypotheca, the thing remained in the possession of the debtor. It was found more easy and commodious to engage an effate by a civil covenant than by an actual delivery: accordingly the expedient was first practifed among the Greeks; and from them the Romans borrowed both the name and the thing : only the Greeks, the better to prevent frauds, used to fix forme wifible-

Hypothe- vinble mark on the thing, that the public might know Hypothesis, it was hypothecate or mortgaged by the proprietor; but the Romans, looking on fuch advertisements as injurious to the debtor, forbad the use of them.

The Roman lawyers diftinguished four kinds of hypothecas: the conventional, which was with the will and confent of both parties; the legal, which was appointed by law, and for that reason called tacit; the prætor's pledge, when by the flight or non-appearing of the debtor, the creditor was put in possession of his effects; and the judiciary, when the creditor was put in possession by virtue of a sentence of the court.

The conventional hypotheca is subdivided into general and special. The hypotheca is general, when all the debtor's effects, both present and future, are engaged to the creditor. It is special, when limited to

one or more particular things.

For the tacit hypotheca, the civilians reckon no less

than twenty-fix different species thereof.

HYPOTHENUSE, in geometry, the longest fide of a right-angled triangle, or that which subtends the right angle.

HYPOTHESIS, (formed of varo " under," and Store positio, of Tibnut pono, " I put"), is a proposition or principle which we suppose, or take for granted, in order to draw conclusions for the proof of a point in question.

In disputation, they frequently make false hypothefes, in order to draw their antagonists into abfurdities: and even in geometry truths are often deducible from

fuch false hypotheses.

Every conditional or hypothetical proposition may be diftinguished into hypothesis and thesis: the first rehearfes the conditions under which any thing is affirmed or denied; and the latter is the thing itselfaffirmed or denied. Thus, in the proposition, a triangle is half of a parallelogram, if the bases and altitudes of the two be equal; the latter part is the hypothesis, " if the bases," &c. and the former the thesis, " a triangle is half, a parallelogram."

In first logic, we are never to pass from the hypothefis to the thefis; that is, the principle supposed must be proved to be true, before we require the con-

fequence to be allowed.

HYPOTHESIS, in physics, &c. denotes a kind of fystem laid down from our own imagination, whereby to account for some phenomenon or appearance of nature. Thus we have hypothesis to account for the tides, for gravity, for magnetism, for the deluge, &c.

The real and scientific causes of natural things generally lie very deep : observation and experiment, the proper means of arriving at them, are in most cases extremely flow; and the human mind is very impatient: hence we are frequently driven to feign or invent something that may feem like the cause, and which is calculated to answer the several phenomena, so that it may possibly be the true cause.

Philosophers are divided as to the tife of fuch fictions or hypotheses, which are much less current now than they were formerly. The latest and best writers are for excluding hypotheses, and standing wholly on obfervation and experiment. Whatever is not deduced from phenomena, fays Sir Ifaac Newton, is an hypothefis; and hypothefes, whether metaphyfical, or phyfical, or mechanical, or of occult qualities, have no place in experimental philosophy.

Nº 162.

The Cartefians take upon them to suppose what af- Hypothesis fections in the primary particles of matter they please; Hyssopus just what figures, what magnitudes, what motions, and what fituations, they find for their purpofe. They also feign certain unseen, unknown fluids, and endue them with the most arbitrary properties; give them a fubtilty which enables them to pervade the pores of all bodies, and make them agitated with the most unaccountable motions. But is not this to fet afide the real constitution of things, and to substitute dreams in their place? Truth is fcarce attainable even by the furest observations; and will fanciful conjectures ever come at it? They who found their speculations on hypotheses, even though they argue from them regularly, according to the strictest laws of mechanics, may be faid to compose an elegant and artful fable; but it is still only a fable.

HYPOTHESIS is more particularly applied in aftronomy to the feveral fystems of the heavens; or the different ways in which different astronomers have supposed the heavenly bodies to be ranged, moved, &c.

The principal hypotheses are the Ptolemaic, Copernican, and Tychonic. The Copernican is now become fo current, and is fo well warranted by observation, that the retainers thereto hold it injurious to call it an hypothesis. See Astronomy.

HYPOTIPOSIS. See ORATORY, nº 91.

HYPOXIS, in botany: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 10th order, Coronaria. The corolla is divided into fix parts, and perfifting, fuperior; the capfule narrowing at the base; the calyx a bivalved glume.

HYPSISTARII, (formed from whises "highest), a fect of heretics in the fourth century; thus called from the profession they made of worshipping the most high

The doctrine of the Hypfiftarians was an affemblage of Paganism, Judaism, and Christianity. They adored the most high God with the Christians; but they also revered fire and lamps with the heathens; and obferved the fabbath, and the diffinction of clean and unclean things with the lews.

The Hypfistarii bore a near refemblance to the Eu-

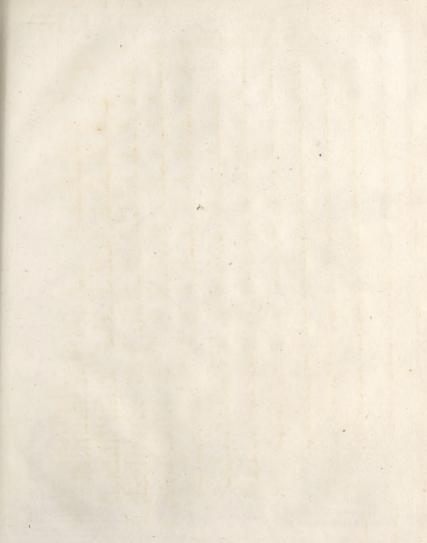

chites, or Maffalians.

HYRCANIA (anc. geog.), a country of the farther Asia, lying to the south-east of the Mart Hyrcanum or Caspium; with Media on the west, Parthia on the south, and Margiana on the west. Famous for its tygers (Virgil); for its vines, figs, and olives, (Strabo).

HYRCANIA (anc. geog.); a town of Lydia, in the campus Hyrcanus, near Thyatira; fo called from colonifts brought from Hyrcania, a country lying to the fouth of the Caspian sea. The people called Hyrcani Macedones, because a mixed people (Pliny) .- Another Hyrcania, the metropolis of the country called Hyrcania. Thought to be the Tape of Strabo, the Syrinx of Polybius, the Zeudracarta of Arrian, and the Afaac of Ifidores Characenus .- A third, a strong place of Judea, built by Hyrcanus.

HYSSOP. See HYSSOPUS. Hedge-Hrssor. See GRATIOLA.

HYSSOPUS, HYSSOP: A genus of the gymnospermia order, belonging to the didynamia class of plants. There are three species; but only one of them,

H. cristata.

Hystrix. H. coendou.

Heprehensilis.

A. Bell Prin Hal Sculptor fecit.

Hyderic viz. the officinalis, or common hystop, is cultivated for M. Buffon and some other late naturalists affure us, that Hydrix use. This hath under shrubby, low, bushy stalks, the animal possesses no such power. M. Busson fregrowing a foot and an half high; fmall, spear-shaped, close-fitting, opposite leaves, with several smaller ones rifing from the same joint; and all the stalks and branches terminated by erect whorled spikes of flowers, of different colours in the varieties. They are very hardy plants; and may be propagated either by slips or cuttings, or by feeds. The leaves have an aromatic fmell, and a warm pungent tafte. Besides the general virtues of aromatics, they are particularly recommended in humoural althmas, coughs, and other diforders of the breast and lungs; and are faid notably to promote expectoration.

Hyffop was generally made use of in purifications amongst the Jews by way of a sprinkler. Sometimes they added a little wool to it of a scarlet colour; for example they dipped a bunch of hyffop, fome branches of cedar and red wool, in water mingled with the blood of a bird, in the purification of lepers. Hyffop, it is probable, grew to a confiderable height in Judæa, fince the gospel informs us that the foldiers filled a fponge with vinegar, put it upon a reed (or long ftem) of hyflop, and prefented it to our Saviour upon the

HYSTERIC AFFECTION, or Passion, ! formed of usepa " womb"); a difease in women, called also suffocation of the womb, and vulgarly fits of the mother. It is a spalmodico-convulsive affection of the nervous system, proceeding from the womb; for the symptoms and cure of which, fee MIDICINE

HYSTERON PROTERON, in grammar and rhetoric, a species of the hyperbaton, wherein the proper order of construction is so inverted, that the part of any tentence which should naturally come first is placed last : as in this of Terence, Valet et vivit, for vivit et valet; and in the following of Virgil, Moriamur, & in media arma ruamus, for In media arma ruamus, &

HYSTRIX, in zoology, a genus of quadrupeds CXLVIII belonging to the order of glires, the characters of which are these: They have two fore teeth, obliquely divided both in the upper and under jaw, befides eight grinders; and the body is covered with quills or

prickles. There are four species, viz.

1. The criftata, or crefted porcupine, has four toes on the fore-feet, five toes on the hind-feet, a crefted head, a fhort tail, and the upper lip is divided like that of a hare. The length of the body is about two feet, and the height about two feet and an half. The or ten inches long, and about #th of an inch thick. Like the bedge-hog, he rolls himfelf up in a globular ritated, he beats the ground with his hind-feet, erects adhere till filled with blood, and then drop off, his quills, shakes his tail, and makes a considerable rattling noise with his quills .- Most authors have afquills to a confiderable distance against the enemy, and

Vol. IX. Part I.

quently irritated the porcupine, but never faw any thing like this darting of his quills. He fays indeed that when the creature was much agitated with paffion, some of the quills which adhered but flightly to the skin would fall off, particularly from the tail; and this circumstance, he imagines, has given rife to the mistake. The porcupine, though originally a native of Africa and the Indies, can live and multiply in the more temperate climates of Spain and Italy Pliny, and every other natural historian fince the days of A. riftotle, tells us, that the porcupine, like the bear, conceals itself during the winter, and that it brings forth its young in 80 days. But these circumstances remain to this day uncertain. It is remarkable, that although this animal be very common in Italy, no person has ever given us a tolerable history of it. We only know in general, that the porcupine, in a domeftic state, is not a fierce or ill-natured animal; that with his foreteeth, which are flrong and sharp, he can cut through a strong board; that he eats bread, fruits, roots, &c.; that he does confiderable damage when he gets into a garden; that he grows fat, like most animals, about the end of fummer; and that his flesh is not bad food.

2. The prehenfilis, or Brafilian porcupine, has four toes on the fore feet, five on the hind-feet, and a long tail. It is confiderably less than the former species; being only 17 inches long from the point of the muzzle to the origin of the tail, which is nine inches long; the legs and feet are covered with long brownish hair; the rest of the body is covered with quills interfperfed with long hairs; the quills are about five inches long, and about Tath of an inch in diameter. He feeds upon birds and small animals. He sleeps in the day like the hedge-hog, and fearches for his food in the night. He climbs trees, and supports himself by twist-ing his tail round the branches. He is generally found in the high grounds of America from Brafil to Louifiana, and the fouthern parts of Canada. His flesh is

esteemed very good eating.

A variety of this species is the Hoitzlacuation, or Mexican porcupine, (le Goendon de Buffon). It is of a dusky colour, with very long briftles intermixed with the down : the spines three inches long, slender, and varied with white and yellow; fcarcely apparent except on the tail, which is, according to Hernandez. thicker and shorter than that of the preceding species. He adds, that the tail from the middle to the end is porcupine is covered with prickles, some of them nine free from spines; and that it grows to the bulk of a middle-fized dog. M. de Buffon fays, its length is 16 or 17 inches from the nose to the tail; the tail 9 form, in which position he is proof against the attacks French measure, but taken from a mutilated skin. It of the most rapacious animals. The prickles are ex- inhabits the mountains of Mexico, where it lives on ccedingly sharp, and each of them has five large black the summer fruits, and may be easily made tame. The and as many white rings, which fucceed one another Indians pulverife the quills, and fay they are very efalternately from the root to the point. These quills ficacious in gravelly cases; and applied whole to the the animal can erect or let down at pleasure; when ir forchead, will relieve the most violent headach. They

3. The dorfata, or Canada porcupine (l'Urfon de Buffon), has four toes on the fore-feet, five on the ferted that the porcupine, when irritated, darts his hind-feet; and has quills only on the back, which are fhort, and almost hid among the long hair. He is that he will kill very large animals by this means. But about two feet long. This species inhabits North Hyfiriz. America as high as Hudfon's Bay; and makes its neft under the roots of great trees. It will also climb among the boughs, which the Indians cut down when one is in them, and kill the animal by firlking it over the nofe. They are very plential near Hudfon's Bay; and many of the trading Indians depend on them for food, cheeming them both wholesome and pleasant. These animals feed on wild fruits and bark of trees, especially juniper; eat snow in winter, and drink water in summer; but avoid going into it. When they cannot avoid their pursuer, they will fidle towards him, in order to touch him with the quills, which feem but

weak weapons of offence; for on fronking the bair, they will come out of the fkin, fitching to the hand. The Indians flick them in their nofes and cars, to make holes for the placing their ear-rings and other finer; they alfo trim the edges of their deer-fkin habits with fringes made of the quills, or cover with them their bark boxes.

4. The macroura, has five toes both on the hind and fore feet; his tail is very long, and the prickles are elevated. He inhabits the isles of the Indian Archi-

pelago, and lives in the forests.

T

I, or i, the ninth letter and third vowel of the alfuddenly against the palate, as it comes out of the larryax, with a small hollowing of the tongue, and nearly the same opening of the lips and talk as in pronouncing a or e. Its sound varies: in some words it is long as bigb, mind, &c.; in others short, as bid, bid, fin, &c.; in others, again, it is pronounced like y, as in collier, onion, &c.; and in a two, it sounds like e, as in machine, magazime, &c. No English word ends in i, e being either added to it, or else the i turned into y.

But befides the vowel, there is the jod confonant; which, because of its different pronunciation, has like-wife a different form, thus J, j. In English, it has the fost found of g; nor is used, but when g fost is required before vowels, where g is usually hard: thus we say, jack, jet, join, &cc. instead of gack, gct, goin, &cc. which would be contrary to the genius of the

English language.

I, ufed as a numeral, fignifies one, and flands for for many unites as it is repeated times: thus I, one; II, two: III, three, &c.; and when put before a higher numeral, it fubtracks itelf, as IV, four; IX, nine, &c. But when fet after it, for many are added to the higher numeral as there are I's added: thus VI is 5+1, or fix; VII, 5+2, or feven; VIII, 5+3, or eight. The ancient Romaus likewife ufed 10 for 500, CIO for 100,001, 1000 for 500,000, and CCIO 50 for 100,000. Farther than this, as Pliny observes, they did not go in their notation; but, when necessary repeated the last number, as CCCIO 30, CCCIO 30, for 200,000; CCCIO 30, CCCIO 30, CCCIO 30, for 200,000; and fo on.

The ancients fometimes changed i into u; as decumus for decimus; maximus for maximus, &c.

According to Plato, the vowel i is proper to express delicate, but humble things, as in this verse in Virgil which abounds in i's, and is generally admired:

Accipiunt inimicum imbrem, rimifque fatifcunt.

I, used as an abbreviature, is often substituted for the whole word Jesus, of which it is the first

JABBOK, a brook on the other file of the Jordan, the fpring whereof is in the mountains of Gilead. It falls into Jordan pretty near the fea of Tiberias, to the fouth of this fea. Near this brook the patriarch Jacob wreftled with the angel (Gen. xxxii. 22). The Jabbok feparated the land of the Ammonites from the Gaulanitis, and the territories of Og king of

JABBEH, Or JABESH-GILEAD, was the name of a city, in the half tribe of Manafich, beyond Jordan. The feripture calls it generally Jabeth-Gilead, because it lay in Gilead, at the foot of the mountains which go by this name. Eusebius places it fix miles from Pella, towards Gerafa; and confequently it must be eaftward of the fea of Tiberias.

IABIRU. See MYCTERIA.

JABLONSKI (Daniel Ernetl), a learned Polith Protethant divine, born at Danzaick in 1660. He became fucceffively minifier of Magdeburg, Liffa, Koningsberg, and Berlin; and was at length eccleiatical counfellor, and president of the academy of sciences at the latter. He took great pains to effect an union between the Lutherans and Calvinitie, and wrote some works which are in good efteem, particularly Meditations on the origin of the Scriptures, &c. He died in 1741.

Jablonski (Theedore), counfellor of the court of Prullia, and fecretary of the royal academy of feiences at Berlin, was also a man of dittinguished merit. He loved the sciences, and did them honour, without that ambition which is generally seen in men of learning: it was owing to this modelly that the greatest part of his works were published without his name. He published, in 1711, a French and German Dictionary; a Course of Morality, in 1713; a Dictionary of Arts and Sciences, in 1721; and translated Tacitus de moribus Germanorum into High Dutch, in

1724.

JABNE (anc. geog.), a town of Palestine, near divinity at Oxford in 1622; and at last was made Jacob chaplain in ordinary, prebendary of Winchester, and dean of Peterborough. He was a very great scholar; Jacobites. and died in 1640. His performance upon the Creed is a learned and valuable piece; which, with his other

A C

works, was published in 1673.

JACOB, the fon of Isaac and Rebekah, was born in the year of the world 2168, before Jesus Christ 1836. The hiftory of this patriarch is given at large in the book of Genesis. He died in Egypt in the 147th year of his age. Joseph directed that the body should be embalmed, after the manner of the Egyptians; and there was a general mourning for him throughout Egypt for seventy days. After this, Jofeph and his brethren, accompanied with the principal men of Egypt, carried him, with the king of Egypt's permission, to the burying place of his fathers near Hebron, where his wife Leah had been interred. When they were come into the land of Canaan, they mourned for him again for feven days; upon which occasion the place where they staid was called Abelmifraim, or the mourning of the Egyptians.

JACOB (Ben Hajim), a rabbi famous for the collection of the Masorah in 1525; together with the text of the bible, the Chaldaic paraphrafe, and Rabbi-

nical commentaries

IACOB (Ben Naphthali), a famous rabbi of the 5th century: he was one of the principal mafforets, and bred at the school of Tiberias in Palestine with Ben Afer, another principal mafforet. The invention of points in Hebrew to ferve for vowels, and of accents to facilitate the reading of that language, are afcribed to these two rabbis; and faid to be done in an affembly of the Jews held at Tiberias, A. D.

JACOB (Giles), an eminent law-writer, born at Romfey in the county of Southampton, in 1686. He was bred under a confiderable attorney; and is principally known for his Law Dictionary in one vol. folio, which has been often printed; a new and improved edition having been lately given by counsellors Ruffhead and Morgan. Mr Jacob also wrote two dramatic pieces; and a Poetical Register, containing the lives and characters of English dramatic poets. The time of his death is not known.

JACOBÆUS (Oliger), a celebrated professor of physic and philosophy at Copenhagen, was born in 1651 at Arhusen in the peninsula of Jutland, where his father was bishop. Christian V. intrusted him with the management of his grand cabinet of curiofities; and Frederic IV. in 1698, made him counfellor of his court of justice. He wrote many medical

works, and some excellent poems.

JACOBINE MONKS, the fame with DOMINICANS. JACOBITES, a term of reproach bestowed on the persons who, vindicating the doctrines of passive obedience and non-relistance with respect to the arbitrary proceedings of princes, difavow the revolution in 1688, and affert the supposed rights and adhere to the interests of the late abdicated King James and his fa-

JACOBITES, in church history, a fect of Christians in Syria and Mesopotamia; so called, either from Jacob a Syrian who lived in the reign of the emperor G 2

Romans. In Joshua xv. it seems to be called Jabneel; but in 2 Chron. xxvi. Jabne. It was taken from the Philistines by Uzziah, who demolished its fortifications.

Joppa; called Jamnia or Jamnial, by the Greeks and

Its port, called Jamnitarum portus, lay between Joppa and Azotus.

JACAMAR, in ornithology. See ALCEDO. JACCA, an ancient town of Spain, in the king-

dom of Arragon, with a bishop's see, and a fort; feated on a river of the same name, among the mountains of Jacca, which are part of the Pyrenees. W. Long. 0. 19. N. Lat. 44. 22.

IACK, in mechanics, a well-known inftrument of common use for raising great weights of any kind.

The common kitchen jack is a compound engine, where the weight is the power applied to overcome the friction of the parts and the weight with which the fpit is charged; and a fleady and uniform motion is obtained by means of the fly.

JACK, in the sca-language, a fort of flag or colours, displayed from a mast erected on the outer end of a thip's bowsprit. In the British navy the jack is nothing more than a fmall union flag, composed of the interfection of the red and white croffes; but in merchant-ships this union is bordered with a red field. See the article Union.

JACK is used also for a horse or wooden frame to faw timber upon; for an instrument to pull off a pair of boots; for a great leathern pitcher to carry drink in; for a small bowl that serves as a mark at the exercife of bowling; and for a young pike.

TACK-Flag, in a ship, that hoisted up at the sprit-

fail top-maft head.

FACK-Daw, the English name of a species of cor-See Corvus.

This bird is very mischievous to the farmer and gardener; and is of fuch a thievish disposition, that he will carry away much more than he can make use of. There is a method of destroying them by a kind of fprings much used in England; and is so useful, that it ought to be made universal .- A stake of about five feet long is to be driven firmly into the ground, and made so fast that it cannot move, and so sharp in the point that the bird cannot fettle upon it. Within a foot of the top there must be a hole bored through it, of three quarters of an inch diameter; through this hole is to be put a flick of about eight inches long: then a horse-hair springe or noose is to be made fail to a thin hazel-wand, and this brought up to the place where the short stick is placed, and carried with it through the hole, the remainder being left open under that flick. The other end of the hazel rod is to be put through a hole in the stake near the ground, and fastened there. The stake is to be planted among the jack daw's food, and he will naturally be led to fettle on it; but finding the point too sharp, he will descend to the little cross slick. This will fink with his weight, and the springe will receive his leg, and hold him fast.

JACKALL, in zoology. See CANIS. JACKSON (Thomas), an eminent English divine,

was born at Witton in the bishopric of Durham in 1579, of a good family. He commenced doctor of

Mauritius.

Jacobus Mauritius, or from one Jacob a monk who flourished They are joined together by shoals or funk rocks; are Jesnapat crooked or bent like half a bow; and are dangerous

The Jacobites are of two feets, some following the rites of the Latin church, and others continuing feparated from the church of Rome. There is also a division among the latter, who have two rival patriarchs. As to their belief, they hold but one nature in Jesus Christ; with respect to purgatory and prayers for the dead, they are of the same opinion with the Greeks and other eastern Christians: they confecrate unleavened bread at the eucharist, and are against confession, believing that it is not of divine institu-

tion.

JACOBUS, a gold coin, worth 25 shillings; fo called from King James I. of England, in whose reign

it was flruck. See Coss.

We ufually diftinguish two kinds of Jacobus, the old
and the newy the former valued at 25 shillings, weighing fix pennyweight ten grains; the latter called also
Carolus, valued at 23 shillings, in weight see pennyweight twenty grains.

JACQUINIA, in botany: A genus of the monogynia order, belonging to the bexandria class of plants; and in the natural method ranking with those of which the order is doubtful. The corolla is decembed; the slamina inserted into the receptacle; the

berry monospermous.

JACULATOR, or shooting Fish. See Cha-

JADDESSES is the name of an inferior order of priefts in Ceylon, who have the care of the chaples appropriated to the genii, who form a third order of gods among thefe idolaters. Thefe priefts are applied to by the people in a time of difeafe or calamity, who offer a cock on their behalf to appeafe the anger of the demons.

JADE-STONE, LAPIS NEPHRITICUS, or Jaspachates, a genus of filiceous earths. It gives fire with feel, and is femitransparent like flint. It does not harden in the fire, but melts in the focus of a burning glass into a transparent green glass with some bubbles. A kind brought from the river of the Amazons in America, and called circoncision stone, melts more easily in the focus into a brown opaque glass, far less hard than the stone itself. The jade-stone is unctuous to the touch; whence Mr Kirwan feems to suspect, that it contains a portion of argillaceous earth, or rather magnefia. The specific gravity is from 2.970 to 3.389; the texture granular, with a greafy look, but exceedingly hard, being fuperior in this respect even to quartz itfelf. It is infufible in the fire, nor can it be diffolved in acids without a particular management; though M. Saussure feems to have extracted iron from it. Sometimes it is met with of a whitish milky colour from China; but mostly of a deep or pale green from America. The common lapis nephriticus is of a grey, vellowish, or olive colour. It has its name from a supposition of its being capable of giving ease in nephritie pains, by being applied externally to the loins. It may be diffinguished from all other stones by its hardnefs, femipellucidity, and fpecific gravity.

JAFFA, the modern name of the city of JOPPA in

Judea.

JAFFATEEN ISLANDS, the name of four islands in the Red Sea, visited by Mr Bruce in his late travels.

They are joined together by shoals or sunk rocks; are J crooked or bent like half a bow; and are dangerous for ships in the night-time, because there seems to be a passage between them, to which while the pilots are paying attention, they neglect wo formal funk rocks which lie almost in the middle of the entrance in deep water.

JAFNAPATAN, a fea port town, feated at the north-eaft end of the island of Ceylon in the Eaft Indies. The Dutch took it from the Fortugues in 1658, and have continued in the possifishor of it since that time. They export from thence great quantities of tobacco, and some elephants, which are accounted the most docile of any in the whole world. E. Long. 80. 25. N. Lat. 9, 30.

JAGENDORF, a town and castle of Silesia, capital of a province of the same name, seated on the river Oppa. E. Long. 17. 47. N. Lat. 50. 4.

JAGGERNAUT, a black pyramidal stone worshipped by the Gentoos, who pretend that it fell from heaven or was miraculously presented on the place where their temple stands. There are many other idols of this figure in India; which, however, are all but accounted copies from the Jaggernaut. According to the best information Mr Grose could obtain, this stone is meant to represent the power presiding over universal generation, which they attribute to the general heat and influence of the fun acting in fubordination to it. Domettic idols of the form of the Jaggernaut, and diltinguished by the same name, are made by the Gentoos. These are niched up in a kind of triumphal car, decorated with gilding and tinfel; which for fome days they keep in the best apartment in their house. During this time their devotion confifts in exhibiting the most obscene postures, and acting all manner of lasciviousness, in fight as it were of the idol, and as the most acceptable mode of worship to that deity it reprefents; after which they carry it in its gilded car in procession to the Ganges, and throw in all together as an acknowledgment to that river of its congenial fertilization with that of the fun. Formerly this machine was decorated with jewels and other expensive ornaments; but the Indians are now become left extravagant, as they found that the Moore and Christians, watching the places where they threw in their idols, dived for them for the fake of the jewels. with which they were adorned.

Our author conjectures; that this pyramidal form of the Gentoo idol was originally taken from that of flame, which always inclines to point upwards. From this Indian deity he fuppofes the flame of the Paphian Venus to have been derived, for which Taoitus could not account. This image had nothing of the human form in it, but rofe orbicularly from a broad baffs, and in the nature of a race goal tapering to a narrow consex a-top; which is exactly the figure of the idol in India, confecrated to fuch an office as that heather deity was fuppofed to prefide over, and to which, on the borders of the Ganges efpecially, the Gentoo virgina are brought to undergo a kind of superficial defloration before they are prefented to their hußands.

JAGO (Richaed), an ingenious poet, was vicar of Smitterfield in Warwickfine, and rector of Kimotoe in Leicelterfine. He was the intimate friend and correfpondent of Mr Shentone, contemporary with him at Oxford, and, it is believed, his fchoolfellow; was of U- niverfity College; took the degree of M. A. July 9. 1739; was author of feveral poems in the 4th and 5th volumes of Dodsley's Poems; published a fermon, in 1755, on the Caufes of Impenitence confidered, preached May 4. 1755, at Harbury in Warwickshire, where he was vicar, on occasion of a conversation said to have passed between one of the inhabitants and an apparition in the church yard there; wrote " Edge-hill," a poem, for which he obtained a large subscription in 1767; and was also author of "Labour and Genius," 1768, 4to; of "The Blackbirds," a beautiful elegy in the Adventurer; and of many other ingenious performances. He died May 28, 1781.

ST JAGO, a large river of South America, which rifes in the audience of Quito and Peru. It is navigable; and falls into the South Sea, after having watered a fertile country abounding in cotton-trees, and inhabited

by wild Americans.

St Jago, the largest, most populous and fertile of the Cape Verd islands, on the coast of Africa, and the residence of the Portuguese viceroy. It lies about 13 miles eastward from the island of Mayo, and abounds with high barren mountains; but the air, in the rainy feafon, is very unwholefome to ftrangers. Its produce is fugar, cotton, wine, and fome excellent fruits. The animals are black cattle, horfes, affes, deer, goats, hogs, civet-cats, and fome very pretty green monkeys with black faces

America, the capital of Chili, with a good harbour, a bishop's see, and a royal audience. It is seated in a large and beautiful plain, abounding with all the necessaries of life, at the foot of the Cordilleras, on the river Mapocho, which runs across it from east to west. Here are feveral canals and a dyke, by means of which they water the gardens and cool the fireets .- It is very much subject to earthquakes. W. Long. 69. 35. S.

Lat. 33. 40.

St 7AGO de Cuba, a town in North America, fituated on the fouthern coast of the island of Cuba, in the bottom of a bay, with a good harbour, and on a river of the same name. W. Long. 76. 44. N. Lat. 20. 0

JAGO de los Cavalleros, a town of America, and one of the principal of the island of Hispaniola. It is feated on the river Yague, in a fertile foil, but bad air.

W. Long. 70. 5. N. Lat. 19. 40.

St JAGO del Entero, a town of South America, one of the most considerable of Tucuman, and the usual residence of the inquisitor of the province. It is feated on a large river, in a flat country, where there is game, tygers, guanacos, commonly called camel-

Sheep, &c.

Fago de la Vega, otherwise called Spanish town, is the capital of the island of Jamaica, in the West Indies; and flands in 18° 1/ north latitude, and 76° 45' well longitude. It is about a mile in length, and little more than a quarter of a mile in breadth; and contains between 500 and 600 houses, with about 4000 inhabitants of all colours and denominations. This town is fituated in a delightful plain, on the banks of the Rio

May, August, and November, and fits three weeks .-- Jaquar St Jago de la Vega is the county-town of Middlefex, and belongs to the parish of St Catharine; in which, parish there are 11 sugar-plantations, 108 pens, and other fettlements, and about 10,000 flaves.

JAGUAR, or JAQUAR, a name given to the Brasilian once. a species of FELIS. See FELIS, spec. vi-

JAGUEER, in East India affairs, any pension from the Grand Mogul, or king of Delhi; generally fuch as

are affigned for military fervices.

JAGUEERDAR, the holder or possessor of a jagueer. It comes from three Persian words, 7a " a place ;" gueriftun " to take ;" and da/htun " to hold ;" quafi " a place holder or penfioner." In the times of the Mogul empire, all the great officers of the court, called omrahs, were allowed jagueers, either in lands of which they collected the revenues, or affignments upon the revenues for specified sums, payable by the lord lieutenant of a province: which fums were for their maintenance, and the support of such troops as they were necessitated to bring into the field when demanded by the emperor, as the condition of their jagueers, which were always revokable at pleafure.

JAIL-FEVER, a very dangerous distemper of the contagious kind, arifing from the putrefcent disposition of the blood and juices. See (the Index subjoined

to) MEDICINE.

JALAP, in botany and the materia medica, the St 7AGO, a handsome and considerable town of South root of a species of convolvulus or bind-weed. See

CONVOLVULUS.

This root is brought to us in thin transverse slices from Xalapa, a province of New Spain. Such pieces should be chosen as are most compact, hard, weighty, dark-coloured, and abound most with black circular ftriæ. Slices of bryony root are faid to be fometimes mixed with those of jalap: these may be easily diftinguished by their whiter colour and less compact texture. This root has no fmell, and very little talte upon the tongue; but when fwallowed, it affects the throat with a fense of heat, and occations a plentiful discharge of faliva. Jalap in fubitance, taken in a dofe of about half a dram (lefs or more, according to the circumflances of the patient) in plethoric, or cold phlegmatic: habits, proves an effectual, and in general a fafe purgative, performing its office mildly, feldom occationing naufea or gripes, which too frequently accompany the other strong cathartics. In hypochondriacal disorders, and hot bilious temperaments, it gripes violently if the jalap be good; but rarely takes due effect as a purge. An extract made by water purges almost universally, but weakly; and at the fame time has a confiderable effeet by urine. The root remaining after this processgripes violently. The pure refin, prepared by spirit of wine, occasions most violent gripings, and other diffreffing symptoms, but scarce proves at all cathartic: triturated with fugar, or with almonds into the form of an emulfion, or diffolved in spirit, and mixed with fvrups, it purges plentifully in a small dose, without occasioning much disorder: the part of the jalap remaining after the feparation of the refin, yields to water an Cobre, 13 miles from Kingston, and 10 from Port extract, which has no effect as a cathartic, but operates Royal. It is the refidence of the commander in chief: powerfully by urine. Its officinal preparations are an and here the fupreme court of judicature is held, four extract made with water and spirit, a simple tincture, times in the year, viz. on the last Tuesdays of February, and a compound powder. - Frederick Hoffman parti-

Jalemus cularly cautions against giving this medicine to children; and affures us, that it will defiroy appetite, wea-Jamaica. ken the body, and perhaps occasion even death. In this point, this celebrated practitioner was probably deceived: children, whose vessels are lax, and the food foft and lubricating, bear these kinds of medicines, as Geoffroy observes, better than adults; and accordingly inoculators make much use of the tincture mixed with fimple fyrup. The compound powder is employed in dropfy, as a hydragogue purge; and where stimulus is not contraindicated, jalap is confidered asasafe cathartic.

JALEMUS, in antiquity, a kind of mournful fong, used upon occasion of death, or any other affecting accident. Hence the Greek proverbs had their original, ιαλιμυ οικροτιρος, or ψυκροτιρος, i. e. more fad or colder than a jalemus, us THE IMPLANE EXTERNATION, worthy to

be ranked among jalemuses.

IAMADAR: An officer of horse or foot, in Hindoftan. Also the head or superintendant of the Peons

in the Sewaury, or train of any great man.

JAMAICA, an island of the West Indies, the largest of the Antilles, lying between 17° and 19° N. Lat. and between 76° and 79° W. Long.; in length near 170 miles, and about 60 in breadth. It approaches in its figure to an oval. The windward passage right before it hath the island of Cuba on the west, and Hispaniola on the east, and is about 20 leagues in breadth.

This island was discovered by admiral Christopher Columbus in his fecond voyage, who landed upon it May 5. 1494; and was fo much charmed with it, as always to prefer it to the rest of the islands: in confequence of which, his fon chose it for his dukedom. It was fettled by Juan d' Esquivel A. D. 1509, who built the town, which, from the place of his birth, he called Seville, and 11 leagues farther to the east stood Melilla. Oriston was on the fouth side of the island, seated on what is now called Blue Fields River. All thefe are gone to decay; but St Jago, now Spanish Town, is still the capital. The Spaniards held this country 160 years, and in their time the principal commodity was cacao; they had an immense stock of horses, asses, and mules, and prodigious quantities of cattle. The English landed here under Penn and Venables, May 11. 1654, and quickly reduced the island. Cacao was also their principal commodity till the old trees decayed, and the new ones did not thrive; and then the planters from Barbadoes introduced fugar-canes, which hath been the great staple ever fince.

The prospect of this island from the sea, by reason of its conflant verdure, and many fair and fafe bays, is wonderfully pleafant. The coast, and for some miles within, the land is low; but removing farther, it rifes and becomes hilly. The whole ifle is divided by a ridge of mountains running east and west, some rising to a great height: and these are composed of rock, and a very hard clay; through which, however, the rains that fall inceffantly upon them have worn long and deep cavities, which they call gullies. These mountains, however, are far from being unpleafant, as they are crowned even to their fummits by a variety of fine trees. There are also about a hundred rivers that issue from them on both fides; and, though none of them are navigable for any thing but canoes, are both pleafing and profitable in many other respects. The cli-

mate, like that of all countries between the tropics, is Jamaica. very warm towards the fea, and in marshy places unhealthy; but in more elevated fituations, cooler; and, where people live temperately, to the full as wholesome as in any part of the West Indies. The rains fall heavy for about a fortnight in the months of May and October; and, as they are the cause of sertility, are styled feafons. Thunder is pretty frequent, and fometimes showers of hail: but ice or snow, except on the tops of the mountains, are never feen; but on them, and at no very great height, the air is exceedingly cold.

The most eastern parts of this ridge are samous under the name of the Blue Mountains. This great chain of rugged rocks defends the fouth fide of the island from those boisterous north-west winds, which might be fatal to their produce. Their streams, though fmall, fupply the inhabitants with good water, which is a great bleffing, as their wells are generally brackish. The Spaniards were perfuaded that these hills abounded with metals: but we do not find that they wrought any mines; or if they did, it was only copper, of which they faid the bells in the church of St Jago were made. They have feveral hot fprings, which have done great cures. The climate was certainly more temperate before the great earthquake; and the island was supposed to be out of the reach of hurricanes, which fince then it hath feverely felt. The heat, however, is very much tempered by land and fea breezes; and it is afferted, that the hottest time of the day is about eight in the morning. In the night, the wind blows from the land on all fides, fo that no fhips can then enter their ports.

In an ifland fo large as this, which contains above five millions of acres, it may be very reasonably conceived that there are great variety of foils. Some of these are deep, black, and rich, and mixed with a kind of potter's earth; others shallow and fandy; and some of a middle nature. There are many favannahs, or wide plains, without stones, in which the native Indians had luxuriant crops of maize, which the Spaniards turned into meadows, and kept in them prodigious herds of cattle. Some of these savannahs are to be met with even amongst the mountains. All these different soils may be juilly pronounced fertile, as they would certainly be found, if tolerably cultivated, and applied to proper purposes. A fufficient proof of this will arise from a very curfory review of the natural and artificial produce of this spacious country.

It abounds in maize, pulse, vegetables of all kinds, meadows of fine grafs, a variety of beautiful flowers, and as great a variety of oranges, lemons, citrons, and other rich fruits. Ufeful animals there are of all forts, horses, affes, mules, black cattle of a large fize, and sheep, the flesh of which is well tasted, though their wool is hairy and bad. Here are also goats and hogs in great plenty; fea and river fish; wild, tame, and water-fowl. Amongst other commodities of great value, they have the fugar-cane, cacao, indigo, pimento, cotton, ginger, and coffee; trees for timber and other uses, such as mahogany, manchineel, white wood, which no worm will touch, cedar, olives, and many more. Befides these, they have fustick, red wood, and various others materials for dyeing. To these we may add a multitude of valuable drugs, fuch as guaiacum, china, farfaparilla, caffia, tamarinds, vanellas, and the prickle-pear

Jamaica. or opuntia, which produces the cochineal; with no inconfiderable number of odoriferous gums. Near the coast they have falt-ponds, with which they supply their own confumption, and might make any quantity

they pleafed.

As this island abounds with rich commodities, it is happy likewife in having a number of fine and fafe Point Morant, the eastern extremity of the island, hath a fair and commodious bay. Passing on to the fouth, there is Port Royal: on a neck of land which forms one fide of it, there flood once the fairest town in the island; and the harbour is as fine a one as can be wished, capable of holding a thousand large veffels, and still the station of our squadron. Old Harbour is also a convenient port, so is Maccary Bay; and there are at least twelve more between this and the western extremity, which is point Negrillo, where our thips of war lie when there is a war with Spain. On the north fide there is Orange Bay, Cold Harbour, Rio Novo, Montego Bay, Port Antonio, one of the finest in the island, and several others. The northwest winds, which fometimes blow furiously on this coast, render the country on that side less fit for canes, but pimento thrives wonderfully; and certainly many other staples might be raifed in small plantations, which are frequent in Barbadoes, and might be very advantageous here in many respects.

The town of Port Royal Rood on a point of land running far out into the fea, narrow, fandy, and incapable of producing any thing. Yet the excellence of the port, the convenience of having thips of feven hundred tons coming close up to their wharfs, and other advantages, gradually attracted inhabitants in fuch a manner, that though many of their habitations were built on piles, there were near two thousand houses in the town in its most flourishing state, and which let at high rents. The carthquake by which it was overthrown happened on the 7th of June 1692, and numbers of people perished in it. This earthquake was followed by an epidemic difease, of which upwards of three thousand died: yet the place was rebuilt; but the greatest part was reduced to ashes by a fire that happened on the 9th of January 1703, and then the inhabitants removed mostly to Kingston. It was, however, rebuilt for the third time; and was raifing towards its former grandeur, when it was overwhelmed by the fea, August 28. 1722. There is, notwithstanding, a small town there at this day. Hurricanes fince that time have often happened, and occasioned terrible devastations.

The island is divided into three counties, Middlefex, Surry, and Cornwall; containing 20 parishes, over each of which prefides a magistrate styled a custos; but these parishes in point of fize are a kind of hundreds. The whole contain 36 towns and villages, 18 churches and chapels, and about 23,000 white inhabitants.

The administration of public affairs is by a governor and council of royal appointment, and the reprefentatives of the people in the lower house of affembly. They meet at Spanish Town, and things are conducted with great order and dignity. The lieutenant-governor and commander in chief has L. 5000 currency, or L. 35571: 8: 63, Sterl. besides which, he has a house in Spanish-town, a pen or a farm adjoining, and a polink or mountain for provisions; a secretary, an under-secretary, and a domeftic chaplain.

The honourable the council confifts of a prefident Jamaica. and 10 members; with a clerk, at L. 270, chaplain L. 100, usher of the black rod and messenger L. 250.

The honourable the affembly confifts of 43 members, one of whom is chosen speaker. To this affembly belong a clerk, with L. 1000 falary; a chaplain, L. 150; messenger, L. 700; deputy, L. 140; and printer,

The number of members returned by each parish and county are, for Middlefex 17, viz. St Catharine 3, St Dorothy 2, St John 2, St Thomas in the Vale 2, Clarendon 2, Vere 2, St Mary 2, St Ann 2: For Surry 16, viz. Kingston 3, Port Royal 3, St Andrew 2, St David 2, St Thomas in the East 2, Portland 2, St George 2: For Cornwall 10, viz. St Elizabeth 2, Westmoreland 2, Hanover 2, St James 2, Trelaw-

The high court of chancery confifts of the chancellor (governor for the time being), 25 mafters in ordinary, and 20 mafters extraordinary; a register, and clerk of the patents; ferjeant at arms, and mace-bearer. The court of vice admiralty has a fole judge, judge furrogate, and commissary, King's advocate, principal register, marshal, and a deputy-marshal. The court of ordinary, confifts of the ordinary (governor for the time being), and a clerk. The fupreme court of judicature, has a chief juffice, L. 120, and 16 affillant judges; attorney-general, L. 400; clerk of the courts, L. 100; clerk of the crown, L. 350; folicitor for the crown; 33 commissioners for taking affidavits; a provost-marshal-general, and eight deputies; 18 barrifters, besides the attorney-general and advocate-general; and upward of 120 practifing attornies at law.

The commerce of Jamaica is very confiderable, not only with all parts of Great Britain and Ireland, but with Africa, North and South America, the West Inc dia islands, and the Spanish main. The ships annually

employed are upwards of 500 fail.

The following account of the exports of this island in 1770, as given by Abbe Raynal, but which in feveral particulars appears to be under-rated, will contribute more than all that hath been faid, to flow the importance of Jamaica. They confifted in 2249 bales of cotton, which at 10 pounds per bale, the price in the island, amounts to 22,490 l.; 1873 hundred weight of coffee, at three pounds five shillings per hundred, 60881; 2753 bags of ginger, at two pounds five shillings per bag, 61941; 2211 hides, at feven shillings per hide, 773 l.; 16,475 puncheons of rum, at 101. per puncheon, 164,7501: Mahogany, 15,282 pieces and 8500 feet, 50,0001. Of pimento, 2,080,734 pounds weight, 52,243 l. Sugar, 57,675 hogsheads, 6425 tierces, 52 barrels, at feventeen pounds ten shillings per hogshead; twelve pounds per tierce, and four pounds per barrel, amounting in the whole to 1,086,620 l. Sarfaparilla, 205 bags, at ten pounds per bag, 2250l. Exports to Great Britain and Ireland, 1,301,2101: To North America, 146,324 1. To the other islands, 595 l. Total of the exports, 1,538,7301.

The following is a general view of the property and chief produce of the whole island in 1786, as prefixed by Mr Beckford to his descriptive account of Ja-

Counties.

Produce, Tamaica Other Sugar Counties. Settle Slaves. Hhds. of Eftates. Sugar. ments. 87100 Middlefex 917 31500

388

Surry -

Cornwall

Total 1061 2018 56 7 T A M It should be here observed, that where two hogs. Jamaics heads of fugar are made, there is at least one puncheon Jambolifera of rum; but the proportion has been of late years more confiderable: the quantity of the latter will therefore be 52,700 puncheous.

A comparative view between the years 1768 and 1786.

Cattle.

75000

The common valuation of an estate in Jamaica as follows :

Sterling Cane land (the canes upon it valued £. 22 per acre. feparately) at Plants 22 ditto. Cane land, in ratoons and young plants 15 ditto. ditto. Pasture land Wood land 4 ditto. ditto. Provisions 14 ditto. Negrocs ditto. Mules 22 10 ditto. ditto. Breeding cattle, &c. 5 Works, water, carts, &c. - from 7 to 10,000

If a planter would wish to lease his estate for a number of years, his income would be large if he could get only 10d. fterling a day for his negroes (the lofs made good), without requiring any thing for his land or works.

JAMBI, or JAMBIS, a fea-port town and fmall kingdom of Asia, on the eastern coast of the island of Sumatra. It is a trading place. The Dutch have a fort here; and export pepper from thence, with the best fort of canes. E. Long. 103. 55. S. Lat. 0. 30. IAMBIA VICUS. See YAMBO.

IAMBIC, in ancient poetry, a fort of verse, so called from its confifting either wholly, or in great part, of iambus's. See IAMBUS.

Ruddiman makes two kinds of iambic, viz. dimeter and trimeter; the former containing four feet, and the latter fix. And as to the variety of their feet, they Nº 162.

confift wholly of iambus's, as in the two following vorfes of Horace:

Dim. Inar fit a ftuo fius Trim. Suis & i pfa Roma vi ribus ruit.

Or, a dactylus, spondeus, anapestus, and sometimes tribrachys, obtain in the odd places; and the tribrachys also in the even places, excepting the laft. Examples of all which may be feen in Horace; as, Dimeter.

2 . 3 Ganidila tra Cavit dates Videre prope rantes domum Trimeter.

Quò quò fcele fli rui tis aut cur den teris. Prius que ca lum fi det in ferius mari. Aliti bus at que cani bus homi cid' He Storem.

Pavidum que lepo r' aut ad venam laqueo gruem. JAMBLICUS, the name of two celebrated Platonie philosophers, one of whom was of Colchis, and the other of Apamea in Syria. The first, whom Julian equals to Plato, was the disciple of Anatolius and Porphyry, and died under the reign of the emperor Constantine. - The fecond also enjoyed great reputation. Julian wrote feveral letters to him, and it is faid he was poisoned under the reign of Valens. - It is not known to which of the two we ought to attribute the works we have in Greek under the name of Jamblicus, viz. 1. The history of the life of Pythagoras, and the fect of the Pythagoreans. 2. An exhortation to the study of philosophy. 3. A piece against Porphyry's letter on the myfteries of the Egyptians.

JAMBOLIFERA, in botany: A genus of the monogynia order, belonging to the octandria el als of plants; and in the natural method ranking with those of which the order is doubtful. The calyx is quadridented; the corolla tetrapetalous, and funnel-shaped; the filaments a little plane; the fligma fimple.

IAMBUS,

poetical foot, confishing of a short syllable followed by a long one; as in

Gev Atya, Dei, meas.

Syllaba longa brevi subjesta vocatur iambus, as Horace expresses it; who also calls the iambus a swift, rapid

The word, according to fome, took its rife from Tambus, the fon of Pan and Echo, who invented this foot; or, perhaps, who only used sharp-biting expresfions to Ceres, when afflicted for the death of Proferpine. Others rather derive it from the Greek , venenum " poifon;" or from walls, maledico " I rail, or revile;" because the verses composed of iambus's

were at first only used in satire. JAMES (St.) called the Greater, the fon of Zebedee, and the brother of John the evangelift, was born at Bethfaida, in Galilee. He was called to be an apostle, together with St John, as they were mending their nets with their father Zebedee, who was a fisherman; when Christ gave them the name of Boanerges, or Sons of Thunder. They then followed Christ, were witnesses with St Peter of the transfiguration on mount Tabor, and accompanied our Lord in the garden of olives. It is believed that St James first preached the gofpel to the dispersed Jews; and afterwards returned to Judea, where he preached at Jerufalem, when the Jews raifed up Herod Agrippa against him, who put him to a cruel death about the year 44. Thus St James was the first of the apostles who suffered martyrdom. St Clement of Alexandria relates, that his accufer was fo ftruck with his constancy, that he became converted and fuffered with him. There is a magnificent church at Jerufalem which bears the name of St James, and belongs to the Armenians. The Spaniards pretend, that they had St James for their aposse, and boast of possessing his body; but Baronius, in his Annals, refutes their pretentions.

JAMES (St.), called the Lefs, an apostle, the brother of Jude, and the fon of Cleophas and Mary the fifter of the mother of our Lord, is called in Scripture the Just, and the brother of Jefus, who appeared to him in particular after his refurrection. He was the first bishop of Jerusalem, when Ananias II. high priest of the Jews, caufed him to be condemned, and delivered him into the hands of the people and the Pharifees, who threw him down from the steps of the temple, when a fuller dashed out his brains with a club, about the year 62. His life was fo holy, that Josephus confiders the ruin of Jerusalem as a punishment inflicted on that city for his death. He was the author of the

epittle which bears his name.

ST JAMES of the Sword, (San Jago del Espada), a military order in Spain, instituted in 1170, under the reion of Ferdinand II, king of Leon and Gallicia. Its end was to put a ftop to the incursions of the Moors; three knights obliging themfelves by a vow to fecure the roads. An union was proposed and agreed to in 1170 between these and the canons of St Eloy; and the order was confirmed by the pope in 1175. The highest dignity in that order is that of grand master,

Vol. IX. Part I.

Tambus, IAMBUS, in the Greck and Latin profody, a faid ancestors have neither been Jews, Saracens, nor James. heretics; nor even to have been called in question by the inquifition. The novices are obliged to ferve fix months in the galleys, and to live a month in a monastery. Heretofore they were truly religious, and took a vow of celibacy; but Alexander III. gave them a permission to marry. They now make no vows but of poverty, obedience, and conjugal fidelity; to which, fince the year 1652, they have added that of defending the immaculate conception of the holy Virgin. Their habit is a white cloak, with a red crofs on the breaft. This is esteemed the most considerable of all the military orders in Spain : the king carefully preferves the office of grand mafter in his own family, on account of the rich revenues and offices, whereof it gives him the dif pofal. The number of knights is much greater now than formerly, all the grandees choosing rather to be received into this than into the order of the golden fleece; inafmuch as this puts them in a fair way of attaining to commands, and gives them many confiderable privileges in all the provinces of Spain, but especially in Catalonia.

JAMES, the name of feveral kings of Scotland and of Great Britain. See (Histories of) SCOTLAND

JAMES I. king of Scotland in 1423, the first of the house of Stuart, was not only the most learned king, but the most learned man of the age in which he flourished. This ingenious and amiable prince fell into the hands of the enemies of his country in his ten-der youth, when he was flying from the fnares of his unnatural ambitious uncle, who governed his dominions, and was fuspected of defigns against his life. Having fecretly embarked for France, the ship was taken by an English privateer off Flamborough-head: and the prince and his attendants (among whom was the earl of Orkney) were confined in a neighbouring castle until they were fent to London. See (History of) SCOTLAND.

The king of England knew the value of the prize he had obtained, and kept it with the most anxious care. The prince was conducted to the Tower of London immediately after he was feized, April 12. A. D. 1405, in the 13th year of his age; and there kept a close prisoner till June 10. A. D. 1407, when he was removed to the castle of Nottingham, from whence he was brought back to the Tower, March 1. A. D. 1414, and there confined till August 3, in the fame year, when he was conveyed to the castle of Windfor, where he was detained till the fummer of A. D. 1417; when Henry V. for political reafons, carried him with him into France in his fecond expedition. In all thefe fortreffes, his confinement, from his own account of it, was so fevere and strict, that he was not fo much as permitted to take the air. In this melancholy fituation, fo unfuitable to his age and rank, books were his chief companions, and fludy his greatest pleasure. He rose early in the morning, immediately applied to reading, to divert him from painful reflections on his misfortunes, and continued his fludies, with little interruption, till late at night. James being naturally fensible, ingenious, and fond of which has been united to the crown of Spain. The knowledge, and having received a good education in knights are obliged to make proof of their defeent from his early youth, under the direction of Walter Wardfamilies that have been noble for four generations on law bishop of St Andrew's, by this close application both fides; they must also make it appear, that their to study, became an universal scholar, an excellent

poet.

James, poet, and exquisite musician. That he wrote as well life. In the monuments of his genius, he hath been James. all our historians who lived near his time. Bowmaker, the continuator of Fordun, who was his contemporary, and perfonally acquainted with him, fpends ten chapfers in his praifes, and in lamentations on his death; and, amongst other things, says, that his knowledge of the scriptures, of law, and philosophy, was incredible. Hector Boyse tells us, that Henry IV. and V. furnished their royal prifoner with the best teachers in all the arts and sciences; and that, by their affiftance, he made great proficiency in every part of learning and the fine arts; that he became a perfect master in grammar, rhetoric, poetry, music, and all the secrets of natural philosophy, and was inferior to none in divinity and law. He observes further, that the poems he composed in his native tongue were fo beautiful, that you might eafily perceive he was born a poet; but that his Latin poems were not fo faultless; for though they abounded in the most sublime sentiments, their language was not fo pure, owing to the rudeness of the times in which he lived. This prince's skill in music was remarkable. Walter Bower abbot of Inch-colm, who was intimate-Iy acquainted with that prince, affures us, that he excelled all mankind in that art both vocal and inftrumental; and that he played on eight different instruments (which he names), and especially on the harp, with fuch exquisite skill, that he seemed to be infpired *. King James was not only an excellent performer, but also a capital composer, both of facred and fecular music; and his fame on that account was extensive, and of long duration. Above a century after his death, he was celebrated in Italy as the inventor of a new and pleasing kind of melody, which had been admired and imitated in that country. This appears from the following testimony of Alessandro Taffoni, a writer who was well informed, and of undoubted credit. "We may reckon among us moderns, James king of Scotland, who not only compofed many facred pieces of vocal music, but also of himfelf invented a new kind of music, plaintive and melancholy, different from all other; in which he hath been imitated by Carlo Gefualdo prince of Venosa, who, in our age, hath improved music with new and admi-Aleffand, rable inventions." + As the prince of Venosa imitated Taff. Pen. king James, the other muficians of Italy imitated the

fieri Diversi, prince of Venosa. "The most noble Carlo Gesual-John Hawlib. 10. Sir

Section on

kin's, vol. 4. a ftyle of modulation, that other muficians yielded the preference to him; and all fingers and players on ftringed instruments, laying aside that of others, every 1 Id. vol. 3, where embraced his ‡. All the lovers, therefore, of Italian or of Scotch music, are much indebted to the admirable genius of king James I. who, in the gloom and folitude of a prison, invented a new kind of music, plaintive indeed, and fuited to his fituation, but at the fame time fo fweet and foothing, that it hath given pleafure to millions in every fucceeding age.

As James I, of Scotland was one of the most accomplished princes that ever filled a throne, he was also one of the most unfortunate. After spending almost 20 years in captivity, and encountering many difficulties on his return into his native kingdom, he was murdered by barbarous affaffins in the prime of

as read much, we have his own testimony, and that of almost equally unfortunate. No vestiges are now remaining of his skill in architecture, gardening, and painting; though we are affured by one who was well acquainted with him, that he excelled in all these arts * Scotics Many of the productions of his pen have also perish- lib. 16. ed; for he tells us himself that he wrote much +; and + King's we know of only three of his poems that are now ex- Quair, tant, viz. Christ's Kirk on the Green-Peebles at the canto r. Play-and the King's Quair, which was lately difco. ftan. 13. vered by Mr Warton, and hath been published by another gentleman t. But slender as these remains are, + See Post they afford sufficient evidence, that the genius of this cal Remain royal poet was not inferior to that of any of his con-Edin. 178

> JAMES II. king of Scotland, 1437, succeeded his Poet vol. father, being then not seven years of age; and was killed at the fiege of Roxburgh in 1460, aged 29.

temporaries; and that it was equally fitted for the and War.

JAMES III. king of Scotland, fucceeded his father, in 1460, in the 7th year of his age. The most striking feature in the character of this prince, unjuftly reprefented as tyrannical by feveral historians, was his fondness for the fine arts, and for those who excelled in them, on whom he bestowed more of his company, confidence, and favour, than became a king in his circumftances. This excited in his fierce and haughty nobles diflike and contempt of their fovereign, and indignation against the objects of his favour!; which produced the most pernicious consequences, and ended in a rebellion that proved fatal to James, who was flain

JAMES IV. king of Scotland, succeeded his father in 1488. He was a pious and valiant prince; fubdued his rebellious subjects; and afterwards, taking part with Louis XII. against Henry VIII. of England, he was slain in the battle of Flouden Field in 1513, aged 41.—This king is acknowledged to have had great accomplishments both of mind and body. His Latin epiftles are claffical, compared with the barbarous style of the foreign princes with whom he corresponded. Like his father, he had a taste for the fine arts, particularly that of sculpture. The attention he paid to the civilization of his people, and his dittribution of juffice, merit the highest praise. After all, the virtues of James appear to have been more thining than folid; and his character was that of a fine gentleman and a brave knight, rather than a wife or a great monarch. At the time of his death, he was only in his forty-first year. Like all the princes of his family (to his great grandfon James VI.) his person was handfome, vigorous, and active. From their coins it does not appear, that either he, or any of his predeceffors of the Stuart race, wore their beards, as did all his fucceffors, to the reign of Charles II.

JAMES V. king of Scotland, in 1513, was but 18 months old when his father loft his life. When of age, he affifted Francis I. king of France against the emperor Charles le Quint ; for which service Francis gave him his eldest daughter in marriage, in 1535. This princess died in two years; and James married Mary of Lorraine, daughter of Claud duke of Guife, and widow of Louis d'Orleans, by whom he had only one child, the unfortunate Mary queen of Scots, born only eight days before his death, which happened De-3.

in 1488, aged 36.

gayeft or the gravest strains.

James. cember 13. 1542, in the 35th year of his age. This injured fubjects, he fled like a coward, infread of dif- Junes. was the first prince of his family who died a natural arming their rage by a dismission of his Popish minideath, fince its elevation to the throne. He died, however, of a broken heart, occasioned by differences with his barons. He was formed by nature to be the ornament of a throne and a bleffing to his people; but his excellent endowments were rendered in a great meafure ineffectual by an improper education. Like most of his predecessors, he was born with a vigorous, graceful person, which, in the early part of his reign, was improved by all the manly exercises then in use. This prince was the author of a humourous composition in poetry, which goes by the name of the Gaberlunzie Man.

JAMES VI. king of Scotland in 1567, and of England in 1603, was fon of Mary queen of Scots; whomhe fucceeded in Scotland, as he did Elizabeth in England. Strongly attached to the Protestant religion, he fignalized himself in its support; which gave rife to the horrid confpiracy of the Papifts to deftroy him and all the English nobility by the Gunpowder Plot, dif covered November 5. 1605. The following year, a political test of loyalty was required, which fecured the king's perfon, by clearing the kingdom of those difaffected Roman-Catholic fubjects who would not fubmit to it. The chief glory of this king's reign confifted in the establishment of new colonies, and the introduction of fome manufactures. The nation enjoyed peace, and commerce flourished during his reign. Yet his administration was despised both at home and abroad: for, being the head of the Protestant cause in Europe, he did not fupport it in that great crisis, the war of Bohemia; abandoning his fon-in-law the elector Palatine; negotiating when he should have fought, deceived at the fame time by the courts of Vienna and Madrid ; continually fending illustrious ambaffadors to foreign powers, but never making a fingle ally. He valued himself much upon his polemical writings; and fo fond was he of theological disputations, that to keep them alive, he founded, for this express purpose, Chelfea-college; which was converted to a much better use by Charles II. His Basilicon Doron, Commentary on the Revelation, writings against Bellarmine, and his Damonologia, or doctrine of witchcraft, are fufficiently known. There is a collection of his writings and fpeeches in one folio volume. Several other pieces of his are extant; fome of them in the Caballa, others in manufcript in the British Museum, and others in Howard's collection. He died in 1625, in the 59th year of his age, and 23d of his reign.

JAMES II. king of England, Scotland, &c. 1685, grandson of James I. succeeded his brother Char. II. It is remarkable, that this prince wanted neither courage nor political abilities whilft he was duke of York; on the contrary, he was eminent for both : but when he afcended the throne, he was no longer the fame man. A bigot from his infancy to the Romish religion and to its hierarchy, he facrificed every thing to establish them, in direct contradiction to the experience he had acquired, during the long reign of his brother, of the genius and character of the people he was to govern. Guided by the Jefuit Peters his confessor, and the infamous chancellor Jessries, he violated every law enacted for the fecurity of the Protestant religion; and then, unable to face the refentment of his fters and pricfts. He rather chofe to live and die a bigot, or, as he believed, a faint, than to support the dignity of his ancestors, or perish beneath the ruins of his throne. The consequence was the revolution in 1689. James II. died in France in 1710, aged 68. He wrote Memoirs of his own life and campaigns to the refloration; the original of which is preferved in the Scotch college at Paris. This piece is printed at the end of Ramfay's life of Marshal Turenne. 2. Memoirs of the English affairs, chiefly naval, from the year 1660 to 1673. 3. The royal fufferer, king James II. confiding of meditations, foliloquies, vows, &c. faid to be composed by his majesty at St Germains. 4. Three letters; which were published by William Fuller, gent. in 1702, with other papers relating to the court of St Germains, and are faid in the title-page to be printed by command.

James (Thomas), a learned English critic and divine, born about the year 1571. He recommended himself to the office of keeper of the public library at Oxford, by the arduous undertaking of publishing a catalogue of the MSS in each college library at both universities. He was elected to this office in 1602, and held it 18 years, when he refigned it to profecute his studies with more freedom. In the convocation held with the parliament at Oxford in 1625, of which he was a member, he moved to have proper commiffioners appointed to collate the MSS of the fathers in all the libraries in England, with the Popish editions, in order to detect the forgeries in the latter; but this proposal not meeting with the defired encouragement, he engaged in the laborious task himself, which he continued until his death in 1629. He left behind

him a great number of learned works.

JAMES (Richard), nephew of the former, entered into orders in 1615 : but, being a man of humour, of three fermons preached before the university, one concerning the observation of Lent was without a text, according to the most ancient manner; another against the text; and the third befide it. About the year 1619, he travelled through Wales, Scotland, Shetland, into Greenland and Russia, of which he wrote observations. He affilted Selden in composing his Marmora Arundeliana; and was very ferviceable to Sir Robert Cotton, and his fon Sir Thomas, in difpofing and fettling their noble library. He died in 1638; and has an extraordinary character given him by Wood for learning and abilities.

JAMES (Dr Robert), an English physician of great eminence, and particularly diftinguished by the preparation of a most excellent fever-powder, was born at Kinverston in Staffordshire, A. D. 1703: his father a major in the army, his mother a fifter of Sir Robert Clarke. He was of St John's college in Oxford, where he took the degree of A. B. and afterwards practifed physic at Sheffield, Lichfield, and Birmingham fuccessively. Then he removed to London, and became a licentiate in the college of physicians; but in what years we cannot fay. At London he applied himself to writing as well as practifing physic; and in 1743, published a Medicinal Dictionary, 3 vols folio. Soon after he published an English translation, with a Supplement by himself, of Ramazzini de morbis artifi-

P. 366.

Hoffman upon Endemial Diftempers, 8vo. In 1746, The Practice of Physic, 2 vols 8vo; in 1760, On Canine Madness, 8vo; in 1764, A Dispensatory, 8vo. June 25. 1755, when the king was at Cambridge, James was admitted by mandamus to the doctorship of phylic. In 1778, were published, A Differtation upon Fevers, and A Vindication of the Fever-Powder, 8vo; with A fhort Treatife on the Diforders of Children, and a very good print of Dr James. This was the 8th edition of the Differtation, of which the first was printed in 1751; and the purpose of it was, to fet forth the fuccess of this powder, as well as to deferibe more particularly the manner of administering it. The Vindication was posthumous and unfinished: for he died March 23. 1776, while he was employed upon it .- Dr James was married, and left feveral fons and daughters.

JAMES's Powder, a medicine prepared by the late Dr Robert James, of which the basis has been long known to chemists, though the particular receipt for making it lay concealed in Chancery till made public by Dr Monro in his Medical and Pharmaceutical Chemistry +. The following (Dr Monro informs us) is a copy of the receipt, extracted from the Records of Chancery; the inventor, when he took out a patent for felling his powder, having fworn, in the most folemn manner, that it was the true and genuine receipt for preparing it:

" Take antimony, calcine it with a continued protracted heat, in a flat, unglazed, earthen veffel, adding to it from time to time a fufficient quantity of any animal oil and falt, well dephlegmated; then boil it in melted nitre for a confiderable time, and feparate the powder from the nitre, by diffolving it in water.

This extract Dr Monro accompanies with the following observations. " When the Doctor first adminiftered his powder, he used to join one grain of the following mercurial preparation to thirty grains of his antimonial powder; but in the latter part of his life be often declared that he had long laid afide the addition of the mercurial. His mercurial, which he called a pill, appears by the records of chancery to have been made in the following manner: " Purify quickfilver, by diffilling it nine times from an amalgam, made with martial regulus of antimony, and a proportional quantity of fal ammoniac; diffolve this purified quickfilver in spirit of nitre, evaporate to dryness, calcine the powder till it becomes of a gold colour; burn fpirits of wine upon it, and keep it for use.' Dr James, at the end of the receipt given into chancery, fays, 'The dose of these medicines is uncertain; but in general thirty grains of the antimonial and one grain of the mercurial is a moderate dose. Signed and fworn to, by Robert Fames.'

" I have frequently directed this powder to be giwen, and have often feen Dr James himfelf as well as ly termed the Vandyck of Scotland, was the fon of Another practitioners administer it, in fevers and in other complaints. Like other active preparations of antimony, it fometimes operates with great violence, even when given in fmall dofes; at other times a large dose gable industry to portraits in oil, though he fometimes produces very little visible effects. I have seen three practised in miniature, and also in history and landgrains operate brifkly, both upwards and downwards; icapes. His largest portraits were somewhat less than and I was once called to a patient to whom Dr James life. His earlieft works are chiefly on board, afterhad himfelf given five grains of it, and it purged and wards on a fine linen cloth fmoothly primed with a

James's cum; to which he also prefixed a piece of Frederic vomited the lady for twenty-four hours, and in that James's time gave her between twenty and thirty flools; at other times I have feen a fcruple produce little or no Jamesone. visible effect.

" So far as I have observed. I think that the dose of this powder to an adult, is from five to twenty grains; and that, when it is administered, one ought

to begin by giving fmall dofes.

"Where patients are strong, and a free evacuation is wanted, this is a ufeful remedy; and it may be given in fmall repeated dofes as an alterative in many cases; but where patients are weakly and in low fevers, it often acts with too great violence; and I have myfelf feen instances, and have heard of others from other practitioners, where patients have been harried to their graves by the use of this powder in a very short.

" It has been called Dr James's Fever Powder; and many have believed it to be a certain remedy for fevers, and that Dr James had cured most of the patients whom he attended, and who recovered, by the use of this powder. But the bark, and not the antimonial powder, was the remedy which Dr James almost always trusted to for the eure of fevers: he gave his powders only to clear the stomach and bowels; and after he had effected that, he poured in the bark as freely as the patient could fwallow it. The Doctor believed all fevers to be more or lefs of the intermitting kind; and that if there was a possibility of curing a fever, the bark was the remedy to effectuate the cure; for if the fever did not yield to that, he was fure that it would yield to no other remedy whatever, as he has more than once declared to me when I have attended patients in fevers along with him."

JAMES Town, a borough and fair-town of Ireland, in the county of Leitrim, and province of Connaught; fituated 5 miles north-west of Carrick, on Shannon, and 73 north-west of Dublin, in north lat. 53. 44. west long. 8. 15. It has a barrack for a company of foot, and returns two members to parliament; patronage in the family of King .- It has three fairs.

St JAMES Day, a festival of the Christian church. observed on the 25th of July, in honour of St James

the greater, fon of Zebedee.

Epifle of St James, a canonical book of the New Testament, being the first of the eatholic or general epiftles; which are fo called, as not being written to one but to feveral Christian churches.

This general epiftle is addressed partly to the believing and partly to the infidel Jews; and is defigned tocorrect the errors, foften the ungoverned zeal, and reform the indecent behaviour of the latter; and to comfort the former under the great hardships they then did, or shortly were to suffer, for the sake of Christianity.

JAMESONE (George), an excellent painter, justdrew Jamesone, an architect; and was born at Aberdeen, in 1586. He studied under Rubens, at Autwerp; and, after his return, applied with indefati-

Jamyn, proper tone to help the harmony of his shadows. His per, who being forced upon them by the intrigues of excellence is faid to confitt in delicacy and foftness, with a clear and beautiful colouring; his shades not charged, but helped by varnish, with little appearance of the pencil. When king Charles I, vifited Scotland in 1633, the magistrates of Edinburgh, knowing his majesty's taste, employed this artist to make drawings of the Scottish monarchs; with which the king was fo pleafed, that, inquiring for the painter, he fat to him, and rewarded him with a diamond-ring from his own finger. It is observable, that Jamesone always drew himfelf with his hat on, either in imitation of his mafter Rubens, or on having been indulged in that Liberty by the king when he fat to him. Many of Jamesone's works are in both the colleges of Aberdeen; and the Sybils there he is faid to have drawn from living beauties in that city. His bell works are from the year 1630 to his death, which happened at Edinburgh in 1644.

JAMYN (Amadis), a celebrated French poet in the 16th century. He is elecemed the rival of Ronfard, who was his cotemporary and friend. He was &cretary and chamber-reader in ordinary to Char. IX. and died about 1585. He wrote, 1. Poetical works, 2 vols. 2. Philosophical discourses to Pasicharis and Rodanthe, with feven academical discourses. 3. A translation of the Iliad of Homer, begun by Hugh Sabel, and finished by Jamyn; with a translation into French verse of the three first books of the Odyssey.

JANE of FLANDERS, a remarkable lady, who feems to have possessed in her own person all the excellent qualities of both fexes, was the wife of John de Mountfort, a competitor for the dukedom of Brittany upon the death of John III. This duke, dying without iffue, left his dominions to his niece Jane, married to Charles de Blois nephew to the king of France; but John de Mountfort, brother to the late duke though by a fecond marriage, claimed the ducky, and was received as fucthe nobility swore fealty to Charles de Blois, thinking him best supported. This dispute occasioned a civil war ; in the course of which John was taken prisoner, and fent to Paris. This misfortune would have entirely ruined his party, had not his interest been supported by the extraordinary abilities of his wife, Jane of Flanders. Bold, daring, and intrepid, the fought like a warrior in the field; shrewd, fensible, and fagacious, the spoke like a politician in the council; and endowed with the most amiable manners, and winning address, fhe was able to move the minds of her fubjects by the force of her eloquence, and mould them exactly according to her pleasure. She happened to be at Rennca when the received the news of her hufband's captivity: but that difaster, instead of depressing her spirits, served only to rouse her native courage and fortitude. She forthwith affembled the citizens; and, holding in her arms her infant fon, recommended him to their care and protection in the most pathetic terms, as the male heir of their ancient dukes, who had always governed them with lenity and indulgence, and to whom they had ever professed the most zealous attachment. She declared herfelf willing to run all hazards with them in fo just a cause; pointed out the resources that still remained in the alliance of England; earnestly befeeching them to make one vigorous effort against an usur-

France, would, as a mark of his gratitude, facrifice the Janizaries. liberties of Brittany to his protector. The people, moved by the affecting appearance, and animated by the noble conduct of the princefs, vowed to live and die with her in defending the rights of her family; and their example was followed by almost all the Bretons. The counters went from place to place, encouraging the garrisons of the feveral fortreffes, and providing them with every thing necessary for their sublistence : after which flie thut herfelf up with her fon in Hennebon, where she resolved to wait for the succours which the king of England (Edward III.) had promifed to fend to her affitance. Charles de Blois, accompanied by the Dukes of Burgundy and Bourbon, and many other noblemen, took the field with a numerous army, and having reduced Rennes, laid fiege to Hennebon, which was defended by the counters in person. This heroine repulfed the affailants in all their attacks with the most undaunted courage, and observing one day that their whole army had left the camp to join in a general ftorm, the rushed forth at a postern-gate, with three hundred horse, set fire to their tents and baggage, killed their futlers and fervants, and raifed fuch a terror and consternation through all their quarters, that the enemy gave over their affault, and getting betwixt her and the walls, endeavoured to cut off her retreat to the city. Thus intercepted, she put the spurs to her horse, and, without halting, galloped directly to Brest, which lay at the distance of two-and-twenty miles fromthe scene of action. There being supplied with a body of five hundred horfe, she immediately returned, and fighting her way through one part of the French camp, was received into Hennebon, amidst the acclamations of the people. Soon after this the English fuccours appeared, and obliged the enemy to raife the

JANEIRO, a province of Brasil in South Amerior for by the people of Nantes. The greatest part of ca, feated between the tropic of Capricorn and 220 of S. Lat. It is bounded on the north by the province of Spirito Sancto, on the east and fouth by the Atlantic Ocean, and on the west by the mountains which separate it from Guiara, in Spanish America. This is the most valuable province which the Portuguese are masters of; for they import from thence yearly great quantities of gold and precious stones, which they find in the mountains, to a prodigious value.

JANICULUM, or JANICULARIS, a hill of ancient Rome, added by Ancus Martius; the burial place of Numa, and of Statius Cacilius the poet : to the east and fouth, having the Tiber; to the west, the fields; to the north, a part of the Vatican. So called, either from an ancient city, (Virgil); or because it was a janua, or gate, from which to iffue out and make incursions on the Tufcans, (Verrius Flaccus.) Now called Mons Aureus corruptly Montorius, from its sparkling fands. From this hill, on account of its height, is the most extensive prospect of Rome: but it is less inhabited, because of its gross air; neither is it reckoned among the seven hills. Hither the people retired, and were hence afterwards recalled by Q. Hortenfins the dictator, (Pliny.)

JANIZARIES, an order of infantry in the Turkish 4 armies; reputed the grand feignior's foot guards. Voffius derives the word from genizers, which in the

Turkifh

D' Herbelot tells us, that jenitcheri fignifies a new band, revifors of the pope's bulls. or troop; and that the name was first given by Amurath I. called the Conqueror, who choosing out one fifth part of the Christian prisoners whom he had taken from the Greeks, and instructing them in the discipline of war and the doctrines of their religion, fent them to Hagi Bektasche (a person whose pretended piety rendered him extremely revered among the Turks), to the end that he might confer his bleffing on them, and at the same time give them some mark to diftinguish them from the rest of the troops .- Bektasche, after bleffing them in his manner, cut off one of the fleeves of the fur-gown which he had on, and put it on the head of the leader of this new militia; from which time, viz. the year of Christ 1361, they have still retained the name jenitcheri, and the fur-cap.

As, in the Turkish army, the European troops are diftinguished from those of Asia; the janizaries are alfo diftinguished into janizaries of Constantinople, and of Damascus. Their pay is from two aspers to twelve per diem; for when they have a child, or do any fignal piece of service, their pay is augmented .- Their dress consists of a dolyman, or long gown, with short seeves, which is given them annually by the grand seignior on the first day of Ramazan. They wear no turbeau; but, in lieu of that, a kind of cap, which they call zarcola, and a long hood of the fame ftuff hanging on their shoulders. On solemn days they are adorned with seathers, which are stuck in a little case on the fore-part of the bonnet .- Their arms, in Europe, in time of war, are a fabre, a carabine or musket, and a cartouch-box hanging on the left fide. At Conflantinople, in time of peace, they wear only a long staff in their hand. In Asia, where powder and firearms are more uncommon, they wear a bow and arrows, with a poingard, which they call baniare .-Though the janizaries are not prohibited marriage, yet they rarely marry, nor then but with the confent of their officers; as imagining a married man to make a worse soldier than a bachelor .- It was Osman, or rior rank to all other foldiers, and are also more arrogant and factious, and it is by them that the public tranquillity is mostly disturbed. The government may therefore be faid to be in the hands of the janizaries. cafe, they behave with the utmost zeal and fidelity.

or expeditions, and the Roman chancery .- Most confifts of writers, the fecond of abbreviators, and the his blood, for all mankind in general.

Janizaries Turkish language fignises novi homines or milites. third of janizaries; who are a kind of correctors and Janen,

JANSEN (Cornelius), bishop of Ypres, one of the most learned divines of the 17th century, and principal of the feet called from his name Jansenists. He was born in Holland of Catholic parents, and studied at Louvain. Being fent to transact some business of confequence relating to the university, into Spain, the Catholic king, viewing with a jealous eyethe intriguing policy of France, engaged him to write a book to expose the French to the pope as no good Catholics, fince they made no scruple of forming alliances with Protestant states. Jansen performed this task in his Mars Gallicus; and was rewarded with a mitre, being promoted to the fee of Ypres in 1635. He had, as mong other writings, before this, maintained a contraverly against the Protestants upon the points of grace and predeftination; but his Augustinus was the principal labour of his life, on which he fpent above 20 years. See the next article.

JANSENISTS, in church-history, a feet of the Roman Catholics in France, who followed the opinions of Jansenius, bishop of Ypres, and doctor of divinity of the universities of Louvain and Douay, in relation

to grace and predeftination.

In the year 1640, the two universities just mentioned, and particularly father Molina and father Leonard Celfus, thought fit to condemn the opinions of the Jefuits on grace and free will. This having fet the controverly on foot, Jansenius opposed to the doctrine of the Jesuits the fentiments of St Augustine; and wrote a treatife on grace, which he intitled Augustinus. This treatife was attacked by the Jesuits, who accused Jansenius of maintaining dangerous and heretical opinions; and afterwards, in 1642, obtained of pope Urban VIII. a formal condemnation of the treatife wrote by Jansenius: when the partisans of Jansenius gave out that this bull was fpurious, and composed by a perfon entirely devoted to the Jesuits. After the death of Urban VIII. the affair of Jansenism began to be more warmly controverted, and gave birth to an infi-Ottoman, or, as others will have it, Amurath, who nite number of polemical writings concerning graces first instituted the order of janizaries. They were at And what occasioned some mirth, was the titles which first called jaja, that is, footmen, to distinguish them each party gave to their writings: one writer publishfrom the other Turks, the troops whereof confifted ed The torch of St Augustine, another found Snuffers mostly of cavalry. The number of janizaries is gene- for St Augustine's torch, and father Veron formed A gaz rally above 40,000; divided into 162 companies or for the Jansenists, &c. In the year 1650, 68 bishops chambers called odas, in which they live together at of France subscribed a letter to pope Innocent X. to Constantinople as in a convent. They are of a supe- obtain an inquiry into and condemnation of the five following propolitions, extracted from Jansenius's Augustinus: 1. Some of God's commandments are impossible to be observed by the righteous, even thought they endeavour with all their power to accomplish They have, however, fome good qualities: they are them. 2. In the state of corrupted nature, we are inemployed to efcort travellers, and especially ambas- capable of resisting inward grace 3. Merit and defadors and persons of high rank, on the road; in which merit, in a state of corrupted nature, does not depend on a liberty which excludes necessity, but on a liberty JANIZARIES, at Rome, are officers or pensioners of which excludes conftraint. 4. The Semipelagians adthe pope, called also participantes, on account of certain mitted the necessity of an inward preventing grace for rites or duties which they enjoy in the annates, bulls, the performance of each particular act, even for the beginning of faith; but they were heretics in main. authors are mistaken in the nature of their office : taining that this grace was of such a nature, that the 'the truth is, they are officers of the third bench or will of man was able either to refift or obey it. It is college of the Roman chancery. The first bench Semipelagianism to say, that Jesus Christ died, or shed

Janstens.

In the year 1652, the pope appointed a congregation for examining into the dispute in relation to grace. In this congregation Jansenius was condemned; and the bull of condemnation, published in May 1653, filled all the pulpits in Paris with violent outcries and alarms against the herefy of the Jansenists. In the year 1656, pope Alexander VII. iffued out another bull, in which he condemned the five propositions of Jansenius. However, the Janfenists affirm, that these propositions are not to be found in this book; but that fome of his enemies having caused them to be printed on a sheet, inserted them in the book, and thereby deceived the pope. At last Clement XI. put an end to the dispute by his conftitution of July 17. 1705; in which, after having recited the constitutions of his predeceffors in relation to this affair, he declares, "That in order to pay a proper obedience to the papal constitutions concerning the prefent question, it is necessary to receive them with a respectful filence." The clergy of Paris, the same year, approved and accepted this bull, and none dared to oppole it.

This is the famous bull Unigenitus, fo called from its beginning with the words Unigenitus Dei Filius, &c. which has occasioned so much confusion in

France

JANSSENS (Abraham), history-painter, was born at Antwerp in 1569. He was cotemporary with Rubens, and also his competitor, and in many of the finest parts of the art was accounted not inferior to that celebrated master. It is reported, that having wasted his time and his substance by a life of diffipation and pleasure, and falling into necessitous circumstances, which he imputed more to ill fortune than to his own neglect of his bufiness, he grew envious at the grandeur in which Rubens appeared, and impatient at his merit and fuccefs; and with peevish insolence challenged him to paint a picture with him only for fame, which he was willing to fubmit to impartial judges. But Rubens rejected the proposal, answering with modesty, that he freely submitted to him, and the world would certainly do juffice to them both.

Sandratt, who had feen feveral of his works, affures us, that he not only gave a fine roundness and relief to his figures, but allo such a warmth and clearness to the carnations, that they had all the look of real flesh; and his colouring was as durable as it was beautiful, retaining its original bustre for a number of years. His most capital periormance is faid to be a refurrection of Lazaros, which is in the cabinet of the elector Palatine, and is an object of admiration to all who behold

ŝt.

JANSENS (Victor Honorius), hiltory-painter, was born at Brufflels in 1664, and was a difeiple of one Volders, under whole direction he continued for feven years; in which time he gave many proofs of a genius far fuperior to those who were infructed in the fame school. He afterwards went to Rome, where he attended particularly to the works of Raphael; he designed after the antiques, and seetched the beautiful scenes around that city; and in a flort time his paintings rose in esteem, and the principal nobility of Rome were destrout to employ lime. He associated with Tempesta, the celebrated landscape painter, for several years, and painted the figures in the works of that great mafter as long as they resided together.

Janssens composed historical subjects, both in a small Janssens, and a large fize; but he found the demand for his Januarius. fmall pictures fo confiderable, that he was induced to paint most frequently in that fize. During 11 years he continued at Rome, which barely fufficed for his finishing those pictures for which he was engaged; nor could he have been even then at his liberty, had he not limited himfelf to a number, and determined not to undertake more. - Returning to Briffels, his performances were as much admired there as they had before been in Italy; but having married, and gradually become the father of 11 children, he was compelled to change his manner of painting in fmall, and to undertake only those of the large kind, as being more lucrative, more expeditious, and also more agreeable to his genius and inclination. He adorned most of the churchesand palaces of his own country with his compositions. -The invention of this artift was fruitful; he defioned correctly, his colouring is natural and pleafing, his pencil free, and the airs of his heads have beauty and elegance. As to the difference between his large and fmall paintings, it is observed, that in correctness and tafte they had an equal degree of merit; but the colouring of the former appears more raw and cold than the colouring of the latter; and it is agreed, that for fmall historical pictures, he was preferable to all the painters of his time.

JANSSEN (Cornelius), called Johnson, an eminent painter of portraits, was born at Amtterdam (though in the Chronological tables, and in Sandrart, it is improperly afferted, that he was born in London), and he refided in England for feveral years; where he was engaged in the service of king James I. and painted feveral excellent portraits of that monarch, as also of his children and of the principal nobility of his court. He had not the freedom of hand, nor the grace of Vandyck; but in other respects he was accounted his equal, and in the finishing his pictures superior. His paintings are eafily diftinguished by their smooth, clear, and delicate tints, and by that character of truth and nature with which they are strongly marked. He generally painted on board; and, for the most part, his draperies are black; probably because the opposition of that tint made his flesh colours appear more beautifully bright, especially in his female figures. It is faid that he used a quantity of ultra marine in the black. colours, as well as in his carnations; which may be one great cause of their preserving their original lustre even to this day. Frequently he painted in a small fize in oil, and often copied his own works in that manner. His fame began to be fomewhat obscured, on the arrival of Vandyck in England; and the civil war breaking out fome time after, induced him to return to his own country, where his paintings were in the highest esteem. He died in 1685.

St JANUARIUS, the patron-faint of Naples, where his head is occasionally carried in procession, in order to stay the eruption of Vessius. The lique-faction of his blood is a famous miracle at Naples. The faint fuffered martyrdom about the end of the third century. When he was beheaded, a pious lady of Naples caught about an ounce of his blood, which has been carefully preserved in a bottle ever since, without having lost a single grain of its weight. This of itself, were it equally demonstrable, might be con-

fideret!

ly liquefies. This experiment is made three different first, is, as it were, the gate of the year. times every year, and is confidered by the Neapoli-

tans as a miracle of the first magnitude.

* Travels in Dr Moore *, though he confesses himself unable to ex- prosperity of the empire. On this day all animosities Ataly, vol. ii. plain on what principle the liquefaction depends, is were fulfended, and friends gave and received new-convinced that it must be fount-thing different from year's gifts, called Strene. On this day too the Rothis: "For he had it (he informs us) from the most mans above all things took care to be merry and divert racle than the flaunchest Protestant, that this con- have distinguished it with the name of All-fools-day." gealed mass has fometimes been found in a liquid state in cold weather, before it was touched by the prieft. or brought near the head of the faint; and that, on other occasions, it has remained folid when brought before him, notwithstanding all the efforts of the priest to melt it. When this happens, the fuperstitious, which, at a very moderate calculation, comprehends 199 in 100 of the inhabitants of this city, are thrown into the utmost consternation, and are sometimes wrought up by their fears into a flate of mind which is highly dangerous both to their civil and ecclefiaftical governors. It is true, that this happens but feldom : for, in general, the fubfiance in the phial, whatever it may be, is in a folid form in the chapel, and becomes hiquid when brought before the faint : but as this is not always the case, it affords reason to believe, that whatever may have been the cafe when this miracle or principle on which it depends has fomehow or other been loft, and is not now understood fully even by the hand, and a key in his left, to fignify his extensive au priefls themselves; or else they are not now so expert thority, and his invention of locks. as formerly, in preparing the fubstance which reprefents the faint's blood, fo as to make it remain folid when it ought, and liquefy the inflant it is required." For the principle on which this pretended miracle is pened their folar year, with an image with a key in performed, or the composition by which it is or may be performed, fee CHEMISTRY, no 800.

The head and blood of the faint are kept in a kind of prefs, with folding doors of filver, in the chapel of St Januarius belonging to the cathedral church. The real head is probably not fo fresh, and well preserved, as the blood. On that account, it is not exposed to the eyes of the public; but is inclosed in a large filver buft, gilt and enriched with jewels of high value. This being what appears to the people, their idea of the foundation of Rome till the reign of Augustus, and fix faint's features and complexion are taken entirely from times afterwards. It was first that during the long reign the buft .- The blood is kept in a fmall repository by of Numa, who instituted this ceremony. 2. In the

year, according to the computation now used in the the year of Rome 725. 4. On Augustus's return from west. The word is derived from the Latin Januarius, the war which he had against the Cantabrians in Spain, a name given it by the Romans from Janus, one of in the year of Rome 729. 5. Under the same emperor, in Nº 162.

J-huarius, fidered as a greater miracle than the circumstance on their divinities, to whom they attributed two faces, Jahuary, January which the Neapolitans lay the whole stress, viz. that because on the one fide the first day of January looked the blood which has congealed, and acquired a folid towards the new year, and on the other towards the the blood which has congenety, and equired a long of the blood which has a same and the had of old one. The word Januarius may also be derived the faint, than, as a mark of veneration, it immediates from janua "s gate;" in regard this month being the

January and February were introduced into the year by Numa Pompilius; Romulus's year beginning in the The fubstance in the bottle, which is exhibited for month of March .- The kalends, or first day of this the blood of the faint, has been supposed to be some- month, was under the protection of Juno, and in a thing naturally folid, but which melts with a small peculiar manner confecrated to Janus by an offering degree of heat. When it is first brought out of the of a cake made of new meal and new falt, with new cold chapel, it is in its natural folid flate; but when frankincense and new wine. On the first day of Jabrought before the faint by the prieft, and rubbed be- nuary a beginning was made of every intended work, tween his warm hands, and breathed upon for fome the confuls elect took poffession of their office, who time, it melts; and this is the whole mystery. But with the slamens, offered facrifices and prayers for the fatisfactory authority, from those who had opportunithemselves, and oftentimes such a scene of drunkenness ties of knowing, and who believe no more in the mi- was exhibited, that they might with propriety enough

> The Christians heretofore fasted on the first day of January, by way of opposition to the superstitions and debaucheries of the heathens.

> JANUS, in heathen worthip, the first king of Italy, who, it is faid, received Saturn into his dominions, after his being driven from Arcadia by Jupiter. He tempered the manners of his fubjects, and taught them civility; and from him they learned to improve the vine, to fow corn, and to make bread. After his death, he was adored as a god.

This deity was thought to prefide over all new undertakings. Hence, in all facrifices, the first libations of wine and wheat were offered to Janus, all prayers prefaced with a fhort address to him; and the firth month of the year was dedicated to and named from him. See JANUARY.

Janus was represented with two faces, either to detrick, call it which you pleafe, was first exhibited, the note his prudence, or that he views at once the past and approaching years; he had a sceptre in his right

> Though this is properly a Roman deity, the abbé la Pluche reprefents it as derived from the Egyptians, who made known the rifing of the dog-flar, which oits hand, and two faces, one old and the other young,

to tipify the old and new year. Temple of JANUS, in ancient history, a square build ing at Rome (as fome fay) of entire brass, erected by Romulus, and fo large as to contain a statue of Janus five feet high, with brazen gates on each fide, which were always kept open in time of war, and thut in time of peace. But the Romans were fo much engaged in war, that this temple was fluit only twice from the year of the city 519, after the end of the first Punic JANUARY, the name of the first month of the war. 3. By Augustus after the battle of Actium, in

744, about five years before the birth of Chrift, when tion: this circumstance, however, not only renders Japan. there was a general peace throughout the whole Roman empire, which lafted 12 years. 6. Under Nero, 811. 7. Under Vespasian, 824. 8. Under Constantius, when, upon Magnentius's death, he was left fole possession of the empire, 1105. Some dispute the authority on which it is faid to have been shut by Conftantius, and fay that the last time of its being shut was under Gordian, about the year of Rome 994. Virgil gives us a noble description of this custom, Æn. lib. iii. ver. 607, &c. The origin of this cuttom is not certainly known.

JANUS was also the name of a street in Rome, in abited for the most part by bankers and usurers. It was fo called from two flatues of Janus which were erected there, one at the top, the other at the bottom, of the fireet. The top of the fireet was therefore called Janus Summus, the bottom Janus Imus, and the middle Janus Medius. Hence Horace, lib. i. Epift. 1.

Hac Fanus summus ab imo perdocet. and Sat. 3. Lib. 2 .- Poftquam

omnis res mea Janum Ad mediam fratta eft .-

JAPAN, a general name for a great number of islands lying between the eastern coast of Asia and the western one of America, and which all together form a large and potent empire. They extend from the 30th to the 41st degree of latitude, and from the 130th to the 147th of east longitude.

Were South and North Britain divided by an arm of the fea, Japan might be most aptly compared to England, Scotland, and Ireland, with their respective smaller islands, peninsulas, bays, channels, &c. all under the

fame monarch.

The Europeans call the empire Japan; but the inhabitants Niphon, from the greatest island belonging to it; and the Chinese Ciphon, probably on account of its eaftern fituation; thefe names fignifying, in both languages, the Basis or Foundation of the Sun. It was first discovered by the Portuguese about the year of

Christ 1542.

Most of the islands which compose it are surrounded with fuch high craggy mountains, and fuch shallow and boifterous feas, that failing about them is extremely dangerous; and the creeks and bays are choaked up with fuch rocks, shelves, and fands, that it looks as if Providence had defigned it to be a kind of little world by itself. These seas have likewise many dangerous whirlpools, which are very difficult to pass at low water, and will fuck in and fwallow up the largest veffels, and all that comes within the reach of their vortex, dashing them against the rocks at the bottom; infomuch that fome of them are never feen again, and others thrown upon the furface at some miles distance. Some of these whirlpools also make a noise terrible to

The Chinese pretend that the Japan islands were first peopled by themselves: but it is more probable that the original inhabitants were a mixture of different nations, driven thither by those tempestuous seas,

and at different times. As these islands lie in the fifth and fixth climates. they would be much hotter in fummer than England, were not the heats refreshed by the winds which continually blow from the fea around them, and to which

Vol. IX. Part I.

their winters excessive cold, but the seasons more inconstant. They have great falls of snow in winter, which are commonly followed by hard frosts. The rains in fummer are very violent, especially in the months of June and July, which on that account are called fat fuki, or water months. The country is alfo much subject to dreadful thunders and lightnings, as well as ftorms and hurricanes, which frequently do a great deal of damage.

The foil, though naturally barren and mountainous, by the industry of the inhabitants, not only supplies them with every necessary of life, but also furnishes other countries with them; producing, besides corn, the finest and whitest rice and other grains, with a great variety of fruits, and vast numbers of cattle of all forts. Besides rice, and a fort of wheat and barley, with two forts of beans, they have Indian wheat, millet, and feveral other kinds in great abundance. Their feas, lakes, and rivers, abound with fish; and their mountains, woods, and forests, are well stocked with horfes, elephants, deer, oxen, buffaloes, sheep, hogs, and other useful animals. Some of their mountains also are enriched with mines of gold, filver, and copper, exquifitely fine, befides tin, lead, iron, and various other minerals and fossils; whilst others abound with feveral forts of marble and precious stones. Of these mountains, some may be justly ranked among the natural rarities of this country; one, in particular, in the great island of Niphon, is of fuch prodigious height as to be easily seen forty leagues off at fea, though its diftance from the shore is about eighteen. Some authors think it exceeds the famous Peak of Teneriffe; but it may rather be called a cluster or group of mountains, among which are no less than eight dreadful volcanoes, burning with incredible fury; and often laying waste the country round about them i but, to make some amends, they afford great variety of medicinal waters, of different degrees of heat; one of these, mentioned by Varenius, is faid to be as hot as burning oil, and to fcorch and confume every thing thrown into it.

The many brooks and rivers that have their fources among the mountains, form a great number of delightful cafcades, as well as fome dreadful cataracts. Among the great variety of trees in the forests here, the cedars exceed all of that kind through India, for ftraightness, height, and beauty. They abound in most of the islands, especially the largest

Their feas, besides fish, furnish them with great quantities of red and white coral, and some pearls of great value, besides a variety of sea-plants and shells; which last are not inferior to those that are brought from Amboyna, the Molucca and other eafterly islands.

The vast quantity of fulphur with which most of the Japan islands abound, makes them subject to frequent and dreadful earthquakes. The inhabitants are fo accustomed to them, that they are scarcely alarmed at any, unless they chance to be very terrible indeed. and lay whole towns in ruins, which very often proves the case. On these occasions, they have recourse to extraordinary facrifices, and acts of worship, to their deities or demons, according to the different notions of each fect, and fometimes even proceed to offer husman victims: but in this case they only take some of they are much exposed by the height of their situa- the vilest and most abandoned fellows they can meet Japan. with, because they are only sacrificed to the malevo-

The religion throughout Japan, it is well known, is Pagan, split into several sects, who live together in the greatest harmony. Every fect has its own temples and priefts. The spiritual emperor the Dairi, is the chief of their religion. They acknowledge and honour a Supreme Being. The author of this relation (Dr Thunberg) faw two temples of the God of gods of a majestic height. The idol that represented this god was of gilded wood, and of fo prodigious a fize, that upon his hands fix persons might fit in the Japanese fashion; his shoulders were five toises broad. In the other temple, the infinite power of this god was reprefented by little gods to the number of 33,333, all ftanding round the great idol that represented God. The priefts, who are numerous in every temple, have nothing to do but to clean the pavement, light the lamps, and dress the idol with flowers. The temples are open to every body, even to the Hollanders; and in case they are in want of a lodging in the fuburbs, when they go to the court of Jedo, they are entertained with hospitality in these temples.

Christianity, if Popery deserves that name, had once made a confiderable progress in this country, in confequence of a mission conducted by the Portuguese and Spanish Jesuits; amongst whom the famous faint Francis Xavier was employed, but foon relinquished the fervice. There were also some Franciscan friars of Spain engaged at last. The Jesuits and friars were supplied from Goa, Macao, and the Manilhas. At first the undertaking proceeded with the most rapid success, but ended at last in the most tragical manner, all owing to the pride and haughtiness, the misconduct, rapacity, and fenfeless extravagant conspiracy of the fathers against the state. This folly and madness produced a persecution of 40 years duration, terminated by a most horrible and bloody maffacre, not to be paralleled in hiftory. After this the Portuguese, as likewise the Chriflian religion, were totally expelled the country, and the most effectual means taken for preventing their return. The natives are for this purpose prohibited from going out of the country; and all foreigners are excluded from an open and free trade; for as to the Dutch and Chinese, under which last name some other eastern nations go thither, they are shut up whilst they remain there, and a most strict watch is fet upon them, infomuch that they are no better than prisoners; and the Dutch, it is faid, to obtain a privilege even fo far, declared themselves to be no Christians, but Dutchmen. This calumny, however, Dr Kempfer has endeavoured to wipe off, but not altogether to satisfacton.

It was about the year of Chrift 1549, or fix years after the first discovery, that the fathers of the fociety arrived there, being induced by the favourable representations of a young Japaneie who had sied to Goa. Till the year 1625, or sear 1630, the Christian religion spread through most of the provinces of the empire, many of the princes and lords opeuly embracing it; and "there was very good reason to hope, that within a short compass of time the whole empire would have been converted to the faith of our Saviour, had not the ambitious views, and the impatient endeavours of the fathers to reap the temporal as well as the spiritual fruits of their care and labour, so provoked the supreme maiefly of the empire as to raise against themselves.

their converts a perfecution which hath not its parallel Japan. In history, whereby the religion they preached, and all those that professed it, were in a few years time entirely exterminated."—The fathers had made a progress for great, that the princes of Bungu, Arima, and Omura, who had been baptized, "fent, in the year 1582, some of their nearfel relations, with letters and presents, to pay homage to the then pope, Gregory XIII. and to assume that the same that the same an account of which most celebrated embalify hath been given in the works of that incomparable historian Thanuns, and by many other Roman catholic writers,"

But notwithstanding this pleasing prospect, the emperor, anno 1586, iffued proclamations for the suppresfion of the religion, and the perfecution began. This, however, at first had not that effect which the government expected; for though, according to the letters of the Jefuits, 20,570 perfons suffered death for the faith of Christ in the year 1500 only, yet in 1501 and 1502, when all the churches were actually thut up, they made 12,000 new converts. The bufiness was finally concluded by the maffacre at Simabara, about the year 1640. The reasons of the emperor's proclamations, making it death to embrace the religion, were as follows: 1. The new religion occasioned confiderable alterations in the Japanese church, and was prejudicial in the highest degree to the heathen clergy. 2. It was feared the innovation in religion might be attended with fatal confequences even in regard to the fick; but what more immediately gave rife to them was, as the Japanese of credit confessed to Dr Kempser, pride and covetoufness; pride among the great ones, and covetousness in people of less note; the spiritual fathers aiming not only at the falvation of their fouls, but having an eve also to their money and lands, and the merchants disposing of their goods in the most usurious and unreasonable manner. To confine ourselves to the clergy here : they "thought it beneath their dignity to walk on foot any longer; nothing would ferve them but they must be carried about in stately chairs, mimicking the pomp of the pope and his cardinals at Rome. They not only put themselves on an equal foot with the greatest men of the empire, but, swelled with ecclesiastical pride, fancied that even a superior rank was nothing but their due. It one day happened, that a Portuguese bishop met upon the road one of the counfellors of state on his way to court. The haughty prelate would not order his chaife to be stopped, in order to alight and to pay his respects to this great man, as is usual in that country; but, without taking any notice of him, nay indeed without showing him so much as common marks of civility, he very contemptuously bid his men carry him by. The great man, exasperated at so signal an affront, thenceforward bore a mortal hatred to the Portuguese, and, in the height of his just resentment, made his complaint to the emperor himfelf, with fuch an odious picture of the insolence, pride, and vanity of this nation, as he expected could not but raife the emperor's utmost indignation." This happened in 1566. The next year the persecution began anew, and 26 persons, of the number whereof were two foreign Jesuits, and several other fathers of the Franciscan order, were executed on the crofs. The emperor Jiojas had usurped the crown on his pupil Tidajori, who, as likewife the greater part of his court and party, had been either Christians themfelves, or at least very favourably inclined to that reli-

gion a

gion, fo that reasons of flate mightily co-operated to and the rather, since the first imperial orders notwith- Japanforward the perfecution.

Some Franciscan friars, whom the governor of the Manilhas had fent as his ambassadors to the emperor of Japan, were guilty at this time of a most imprudent thep : they, during the whole time of their abode in the country, preached openly in the freets of Macao where they refided; and of their own accord built a church, contrary to the imperial commands, and contrary to the

advice and earnest folicitations of the Jesuits. Some time after, a discovery of a dangerous conspiracy, which the fathers, and the yet remaining adherents of their religion, entered into against the person of the emperor, as a heathen prince, put a finishing stroke to the affair, and hastened the sentence which was pronounced foon after, that the Portuguese should for state feemed defirous to spare the merchants and fecular persons, for the purpose of continuing trade and commerce with them, which was looked upon as an affair independent of religion. The affair of the conspiracy was as follows: the Dutch had had an eye to the trade of Japan before 1600, and in 1611 had liberty of a free commerce granted them by the imperial letters patent, and had actually a factory at Firando. The Dutch were then at war with Spain, which was then fovereign of the Portuguese dominions; so that it was natural for them to be trying to supplant them. The Portuguese, on their part, made use of all malicious inventions to blacken their characters, calling them rebels and pirates, whence it was natural for the Dutch to endeavour to clear, and even to revenge, themselves. Now they "took an homeward bound Portuguese ship near the Cape of Good Hope, on board of which they found fome traiterous letters to the king of Portugal, written by one captain Moro, who was chief of the Portuguese in Japan, himself a Japanese by birth, and a great zealot for the Christian religion. The Dutch took special care to deliver the faid letters to their prowithout loss of time to the governor of Nagasaki, a great friend to the Portuguefe. Captain Moro having been taken up, boldly, and with great affurance, denied the fact, and fo did all the Portuguese then at Nagasaki. However, neither the governor's favour, nor their constant denial, were able to clear them, and to keep off the cloud which was ready to break over their heads. Hand and feal convinced them; the letter was fent up to court, and captain Moro fentenced to be burnt alive on a pale, which was executed accordingly. This letter laid open the whole plot which the Japanese Chriftians, in conjunction with the Portuguese, had laid against the emperor's life and throne; the want they flood in of ships and foldiers, which were promifed them from Portugal; the names of the Japanele princes concerned in the conspiracy; and lattly, to crown all, the expectation of the papal bleffing. This discovery made by the Dutch was afterwards confirmed by another letter written by the faid captain Moro to the Portuguese government at Macao, which was intercepted and brought to Japan by a Japanese ship."

had then already conceived against the Portuguese, it was no difficult matter thoroughly to ruin the little cre-

standing, they did not leave off privately to bring over more ecclefiaftics. Accordingly, in the year 1637, an imperial proclamation was fent to the governors of Nagafaki, with orders to fee it put in execution. It was then the empire of Japan was shut for ever both to foreigners and natives.

Now, although the governors of Nagafaki, on receipt of these commands, took care they should be obeyed, yet the directors of the Portuguese trade maintained themselves in Japan two years longer, hoping to obtain leave to flay in the island of Desima, and there to continue their trade. But they found themselves at last wholly disappointed; for the emperor was resolved to get rid of them; and on affurance given him by the Dutch East India company that they would supply for ever be banished the emperor's dominions; for till then the the future what commodities had been imported by the Portuguese, he declared the Portuguese and the Castilians, and whoever belonged to them, enemies of the empire, forbidding the importation of even the goods of their country, Spanish wines only excepted, for the use of the court. And thus the Portuguese lost their profitable trade and commerce with Japan, and were totally expelled the country before the latter end of the year 1639 or 1640; and thus ended the fruitless popish mission in this empire, for the Portuguese have never been able to restore themselves; and the Dutch have it not in their power to do any one thing in favour of religion, were they fo inclined; but, as it appears, they are very indifferent as to that, and are in but little credit with the Japanefe.

According to Dr Thunberg's refearches, the Japanese have never been subdued by any foreign power, not even in the most remote periods; their chronicles contain fuch accounts of their valour, as one would rather incline to confider as fabulous inventions than actual occurrences, if later ages had not furnished equal firiking proofs of it. When the Tartars, for the first time in 700, had over-run part of Japan, and when, aftector the prince of Firando, who communicated them ter a confiderable time had elapfed, their fleet was destroyed by a violent storm in the course of a fingle night, the Japanese general attacked, and so totally defeated his numerous and brave enemies, that not a fingle person survived to return and carry the tidings of such an unparalleled defeat. In like manner, when the Japanele were again, in 1281, invaded by the warlike Tartars, to the number of 240,000 fighting men, they gained a victory equally complete. The extirpation of the Portuguese, and with them of the Christian religion. towards the beginning of the 17th century, as already mentioned, was fo complete, that fcarce a veflige can now be discerned of its ever having existed there.

With respect to the government of these islands, it is and has been for a long time monarchical; though formerly it feems to have been split into a great number of petty kingdoms, which were at length all fwallowed by one. The imperial dignity had been enjoyed, for a confiderable time before the year 1500. by a regular fuccession of princes, under the title of dairos, a name supposed to have been derived from Dairo the head of that family. Soon after that Confidering this, and the fuspicions which the court epoch, such a dreadful civil war broke out, and lasted fo many years, that the empire was quite ruined. During these distractions and confusions, a common foldit and favour they had as yet been able to preferve; dier, by name Tayckoy, a person of obscure birth,

Japan. but of an enterprifing genius, found means to raife himself to the imperial dignity: having, in little more than three years time, by an uncommon share of good fortune, subdued all his competitors and opponnets, and reduced all their cities and caftles. The dairo, not being in a condition to obstruct or put a stop to his progress, was forced to submit to his terms; and might perhaps have been condemned to much harder, had not Tayckoy been apprehensive left his foldiers, who fill revered their ancient natural monarch, should have revolted in his favour. To prevent this, he granted him the fupreme power in all religious matters, with great privileges, honours, and revenues annexed to it; whillt himself remained invested with the whole civil and military power, and was acknowledged and proclaimed king of Japan. This great revolution happened in 1517, and Tayckoy reigned feveral years with great wildom and tranquillity; during which he made many wholesome laws and regulations, which still fubfist, and are much admired to this day. At his death, he left the crown to his fon Tayckoffama, then a minor; but the treacherous prince under whose guardianship he was left deprived him of his life before he came of age. By this murder, the crown passed to the family of Jejassama, in which it still continues. Tayckoy and his successors have contented themselves with the title of cubo. which, under the dairos, was that of prime minister, whose office is now fuppreffed; fo that the cubo, in all fecular concerns, is quite as absolute and despotic, and has as extensive a power over the lives and fortunes of all his fubjects, from the petty kings down to the lowest perfons, as ever the dairos had. The dairo refides confrantly at Meaco, and the cubo at Teddo.

> The inhabitants of Japan are well-grown, agile, and active, and at the same time sout limbed, though they do not equal in strength the northern inhabitants of Europe. The colour of the face is commonly yellow; which fometimes varies to brown, and fometimes to white. The inferior fort, who during their work in fummer have often the upper parts of the body naked, are fun burnt and browner; women of diffinction, who never go uncovered into the open air, are perfectly white.

The national character confilts in intelligence and prudence, frankness, obedience, and politeness, goodnature and civility, curiofity, industry, and dexterity, economy and fobriety, hardiness, cleanliness, justice, and uprightness, honesty and fidelity; in being also mistrustful, fuperstitious, haughty, refentful, brave, and invincible.

In all its transactions, the nation shows great intelligence, and can by no means be numbered among the favage and uncivilized, but rather is to be placed among the polified. The prefent mode of government, admirable skill in agriculture, sparing mode of life, way of trading with foreigners, manufactures, &c. afford convincing proofs of their cunning, firmnels, and intrepid courage. Here there are no appearances of that vanity fo common among the Afiatics and Africans, of adorning themselves with shells, glass-beads, and polished metal plates: neither are they fond of the ufeless European ornaments of gold and filver lace, jewels, &c. but are careful to provide themselves from the productions of their own country with neat cloaths well tafted food, and good weapons.

Their curiofity is excessive; nothing imported by Japan. the Europeans efcapes it. They ask for information concerning every article, and their questions continue till they become wearifome. It is the physician, among the traders, that is alone regarded as learned, and particularly during the journey to court and the refidence at Jeddo, the capital of the empire, that he is regarded as the oracle, which they trutt can give refponfes in all things, whether in mathematics, geography, physics, chemistry, pharmacy, zoology, botany, medicine, &c.

Economy has its peculiar abode in Japan. It is a virtue admired as well in the emperor's palace as in the meanest cottage. It makes those of small possessions content with their little, and it prevents the abundance of the rich from overflowing in excess and voluptuousnefs. Hence it happens, that what in other countries is called fearcity and famine, is unknown here; and that, in fo very populous a state, scarce a person in ne-

ceffity, or a beggar, should be found.

The names of families, and of fingle persons, are under very different regulations from ours. The family name is never changed, but is never used in ordinary convertation, and only when they fign fome writing; to which they also for the most part affix their feal. There is also this peculiarity, that the furname is always placed first; just as in botanical books the generic name is always placed before the fpecific name. The prænomen is always used in addreffing a person; and it is changed feveral times in the course of life. A child receives at birth from its parents a name, which is retained till it has itfelf a fon arrived at maturity. A perfon again changes his name when he is invested with any office; as also when he is advanced to an higher trutt: fome, as emperors and princes, acquire a new name after death. The names of women are lefs variable; they are in general borrowed from the most beautiful flowers.

After marriage, the wife is confined to her own apartment, from whence she hardly ever stirs, except once a-year to the funeral-rites of her family; nor is she permitted to see any man, except perhaps fome very near relation, and that as feldom as can be. The wives, as well as in China and other parts of the eaft, bring no portion with them, but are rather bought by the husband of their parents and relations. The bridegroom most commonly sees his bride for the first time upon her being brought to his house from the place of the nuptial ceremony: for in the temple where it is performed the is covered over with a veil, which reaches from the head to the feet. A husband can put his wives to a more or less fevere death, if they give him the least caufe of jealoufy, by being feen barely to converfe with another man, or fuffering one to come into their apart-

The drefs of the Japanese deserves, more than that of any other people, the name of national; fince they are not only different from that of all other men, but are also of the fame form in all ranks, from the monarch to his meanest fubject, as well as in both fexes; and what exceeds all credibility, they have not been altered for at least 2444 years. They universally confift of night-gowns, made long and wide, of which feveral are worn at once by all ranks and all ages. The more diftinguished and the rich have them of the

Japan. finest filk; the poorer fort of cotton. Those of the women reach down to the ground, and fometimes have a train; in the men, they reach down to the heels: travellers. foldiers, and labourers, either tuck them up, or wear them only down to the knees. The habit of the men is generally of one colour; the women have theirs variegated and frequently with flowers of gold interwoven. In fummer, they are either without lining, or have but a thin one; in winter they are fluffed to a great thickness with cotton or filk. The men feldom wear a great number; but the women thirty, fifty, or more, all fo thin, that they fcarce together amount to five pounds. The undermost ferves for a shirt, and is therefore either white or blue, and for the most part thin and transparent. All thefe gowns are fastened round the waist with a belt, which in the men are about a hand's breadth, in the women about a foot; of fuch a length that they go twice round the waift, and afterwards are tied in a knot with many ends and bows. The knot, particularly among the fair fex, is very confpicuous, and immediately informs the spectator whether they are married or not. The unmarried have it behind, on their back; the married before. In this belt the men fix their fabres, fans, pipe, tobacco, and medicine boxes. In the neck the gowns are always cut round, without a collar; they therefore leave the neck bare; nor is it covered with cravat, cloth, or any thing elfe. The fleeves are always ill-made, and out of all proportion wide: at the opening before, they are half fewed up, so that they form a fack, in which the hands can be put in cold weather; they also serve for a pocket. Girls in particular have their fleeves fo long that they reach down to the ground. Such is the fimplicity of their habit, that they are foon dreffed; and to undrefs, they need only open their girdle and draw in their

> As the gowns, from their length, keep the thighs and legs warm, there is no occasion for stockings; nor do they ufe them in all the empire. Among poorer persons on a journey, and among soldiers, who have not fuch long gowns, one fees bulkins of cotton. Shoes, or, more properly fpeaking, flippers, are, of all that is worn by the Japanese, the simplest, the meaneft, and the most miserable, though in general use a-mong high and low rich and poor. They are made of interwoven rice-flraw; and fometimes, for persons of distinction, of reeds split very thin. They consist only of a fole, without upper leathers or quarters. Before, there passes over, transverfely, a bow of linen, of a finger's breadth: from the point of the shoe to this bow goes a thin round band, which running within the great toe, ferves to keep the shoe fixed to the foot. The shoe being without quarters, slides, during walking, like a flipper. Travellers have three bands of twifted straw, by which they fasten the shoe to the foot and leg, to prevent its falling off. The Japanele never enter their houses with shoes, but put them off in the entrance. This precaution is taken for the fake of their neat carpets. During the time the Dutch refide in Japan, as they have fometimes occafion to pay the natives vifits in their houses, and as they have their own apartment at the factory covered with the same fort of carpets, they do not wear European shoes, but have in their stead red, green, or black

flippers, which can eafily be put off at entering in. Japan. They, however, wear stockings, with shoes of cotton, fastened by buckles. These shoes are made in Japan, and may be washed whenever they become dirty.

The way of dreffing the hair is not less peculiar to this people, and less univerfally prevalent among them, than the use of their long gowns. The men shave the head from the forehead to the neck; and the hair remaining on the temples, and in the nape, is well befmeared with oil, turned upwards, and then tied with a white paper thread, which is wrapped round feveral times. The ends of the hair beyond the head, are cut crossways, about a finger's length being left. This part, after being pasted together with oil, is bent in fuch a manner that the point is brought to the crown of the head; in which fituation it is fixed by passing the fame thread round it once. Women, except fuch as happen to be separated from their husbands, shave no part of their head.

The head is never covered with hat or bonnet in winter or in fummer, except when they are on a journey; and then they use a conical hat, made of a fort of grass, and fixed with a ribband. Some travelling women, who are met with on the roads, have a bonnet like a shaving bason inverted on the head, which is made of cloth, in which gold is interwoven. On other occasions, their naked heads are preserved, both from rain and the fun, by umbrellas. Travellers, moreover, have a fort of riding-coat, made of thick paper oiled-They are worn by the upper fervants of princes, and the fuite of other travellers. Dr Thunberg and his fellow-travellers, during their journey to court, were obliged to provide fuch for their attendants when they paffed through the place where they are made.

A Japanese always has his arms painted on one or more of his garments, especially on the long and short gowns, on the fleeves, or between the shoulders; fo that nobody can fleal them; which otherwise might eafily happen in a country where the clothes are fo

much alike in stuff, shape, and size.

The weapons of the Japanese consist of a bow and arrow, fabre, halbert, and musket. The bows are very large, and the arrows long, as in China. When the bows are to be bent and discharged, the troop always refts on one knee, which hinders them making a speedy discharge. In the spring, the troops assemble to practise shooting at a mark. Muskets are not general; Dr Thunberg only faw them in the hands of perfons of diffinction, in a feparate and elevated part of the audience room. The barrel is of the common length; but the flock is very short, and there is a match in the lock. The fabre is their principal and best weapon, which is universally worn, except by the peasants. They are commonly a yard long, a little crooked, and thick in the back. The blades are of an incomparable goodness, and the old ones are in very high efteem. They are far superior to the Spanish blades fo celebrated in Europe. A tolerably thicknail is easily cut in two without any damage to the edge; and a man, according to the account of the Japanefe, may be cleft afunder. A feparate fash is never used, but the sword is thuck in the belt, on the left fide, with the edge upwards, which to a European appears ridiculous. All perfons in office wear two fuch fabres, one of their own, and the other the fword of

office, as it is called; the latter is always the longer.

Both are worn in the belt on the fame fide, and fo disposed as to cross each other. When they are fitting, they have their fword of office laid on one fide to refer them.

The day is divided only into twelve when they are fitting, they have their fword of office laid on one fide or before them.

The day is divided only into twelve when the fitting in this division they are directed the whole of Japan. hours; and in this division they are directed the whole of their month. The day is divided only into twelve when the fitting of the fitting of

The sciences are very far from having arrived at the fame height in Japan as in Europe. The history of the country is, notwithstanding, more authentic, perhaps, than that of any other country; and it is fludied, without diffinction, by all. Agriculture, which is confidered as the art most necessary, and most conducive to the support and prosperity of the kingdom, is no where in the world brought to fuch perfection as here; where neither civil nor foreign war, nor emigration, diminishes population; and where a thought is never entertained, either of getting poffession of other countries, or to import the useless and often hurtful productions of foreign lands; but where the utmost care is taken that no turf lies uncultivated, and no produce of the earth unemployed. Astronomy is purfued and respected; but the natives are unable, without the aid of Chinese, and sometimes of Dutch almanacks, to form a true kalendar, or calculate an eclipfe of the fun or moon within minutes and feconds. Medicine has neither arrived, nor is it likely to arrive, at any degree of perfection. Anatomy is totally unknown; the knowledge of difeafes imperfect, intricate, and often fabulous. Botany, and the knowledge of medicines, constitute the whole of their skill. They use only simples; and these generally in diuretic and diaphoretic decoctions. They are unacquainted with compound medicines. Their physicians always indeed feel the pulse; but they are very tedious, not quitting it for a quarter of an hour; besides, they examine first one, and then the other arm, as if the blood was not driven by the fame heart to both pulses. Besides those difeases which they have in common with other countries, or peculiar to themselves, the venereal disease is very frequent, which they only understood how to alleviate by decoctions, thought to purify the blood. Salivation, which their physicians have heard mentioned by the Dutch furgeons, appears to them extremely formidable, both to conduct and to undergo; but they have lately learned the art of employing the fublimate with much fucces.- Jurisprudence is not an extensive fludy in Japan. No country has thinner law-books, or fewer judges. Explanations of the law, and advocates, are things altogether unknown; but no where, perhaps, are the laws more certainly put in force, without respect to persons, without partiality or violence. They are very ftrict, and law-fuits very fhort. The Japanese know little more of physics or chemiflry than what they have learned of late years of the Europeans.

Their computation of time takes its rife from Min-o, or 660 years before Chrill. The year is divided according to the changes of the moon; so that some years confill of twelve, and others of thirteen months; and the beginning of the year falls out in February or March. They have no weeks confilting of seven days, or of fix working days and a holiday, but the first and fifteenth day of the month serve for a holiday. On these days no work is done. On new-year's-day they go round to wish one another a new year, with their whole families, clad in white and blue chequered,

hours; and in this division they are directed the whole year by the rifing and fetting of the fun. They reckon fix o'clock at the rifing, and fix likewife at the fetting of the fun. Mid-day and mid-night are always at nine. Time is not measured by clocks or hourglasses, but with burning matches, which are twisted together like ropes, and divided by knots. When the match is burnt to a knot, which indicates a certain portion of time elapsed, notice is given during the day, by firiking the bells of the temples; and in the night, by the watchmen striking two boards against one another. A child is always reckoned a year old at the end of the year of his birth, whether this happen at the beginning or the close. A few days after the beginning of the year, is performed the horrid ceremony of trampling on images representing the cross and the Virgin Mary with her child. images are of melted copper, and are faid to be scarce a foot in height. This ceremony is intended to impress every individual with hatred of the Christian doctrine, and the Portuguese, who attempted to introduce it there; and also to discover whether there is any remnant of it left among the Japanese. It is performed in the places where the Christians chiefly refided. In Nagafaki it lasts four days; then the images are conveyed to the circumjacent places, and afterwards are laid afide against the next year. Every person, except the Japanese governor and his attendanss, even the fmallest child, must be prefent; but it is not true, as fome have pretended, that the Dutch are also obliged to trample on the image. Overfeers are appointed in every place, which affemble the people in companies in certain houses, call over the name of every one in his turn, and take care that every thing goes on properly. The children, not yet able to walk, have their feet placed upon it; older perfons pals over it from one fide of the room to the other.

The Japanete are much addicted to poetry, mutic, and painting; the first is said to be grand as to the style and imagery, lostines, and cadence; but, like that of the Chinese, is not easily understood or relisted by the Europeans. The same may be said of their music, both vocal and instrumental; the best of which, of either kind, would hardly be tolerable to a nice European extra

They pretend, like the Chinefe, to have been the inventors of printing from time immemorial, and their method is the fame with theirs, on wooden blocks; but they excel them in the neatnefs of cutting them, as well as in the goodnefs of their ink and paper. They likewife lay claim to the invention of gunpowder; and are vailty luperior to the Chinefe in the use of all florts of fire-arms, efpecially of artillery, as well as the curioufnes of their fire works.

Their manner of writing is much the fame as that of the Chinefe, viz. in columns from top to bottom, and the columns beginning at the right and ending at the left hand. Their characters were also originally the same, but now differ considerably.

Their language hath fome affinity with the Chinefe, though it appears from its various dialects to have been a kind of compound of that and other languages, derived from the various nations that first peopled those Japan. iflands. It is not only very regular, polite, elegant, and copious, but abounds with a great variety of fynonyma, adapted to the nature of the fubject they are upon, whether fublime, familiar, or low; and to the quality, age, and fex, both of the fpeaker and perfon

spoken to.

The Japanele are commonly very ingenious in moft handicraft trades; and excel even the Chinefe in feveral manufactures, particularly in the beauty, good-net fluis, and in their japan and porcelain wares. No eaftern nation come up to them in the tempering and fabricating of feymitars, fwords, mufacts, and other

fuch weapons.

The Japanese architecture is much in the same taste and ftyle as that of the Chinese, especially as to their temples, palaces, and other public buildings; but in private ones they affect more plainness and neatness than show. These last are of wood and cement, confifting of two stories: they dwell only in the lower; the upper chamber ferving for wardrobes. The roofs are covered with rush-mats three or four inches thick. In every house there is a small court, ornamented with trees, fhrubs, and flower-pots; as likewife with a place for bathing. Chimnies are unknown in this country, although fire is needed from the cold month of October till the end of March. They heat their rooms with charcoal contained in a copper stove, which they fit round. Their cities are generally spacious, having each a prince or governor refiding in them. The capital of Jedo is 21 French leagues in circumference: Its streets are straight and large. There are gates at little diffances, with an extremely high ladder, which they afcend to discover fires. Villages differ from cities in having but one freet; which often extends ·feveral leagues. Some of them are fituated fo near each other, that they are only separated by a river or a bridge. The principal furniture of the Japanese confifts in fraw-mats, which ferve them for feats and beds; a fmall table for every one who chooses to eat is the only moveable. The Japanese fit always upon their hams. Before dinner begins, they make a profound bow and drink to the health of the guefts. The women eat by themselves. During the courses, they drink a glass of sakki, which is a kind of beer made of rice kept constantly warm; and they drink at each new morfel. Tea and fakki are the most favourite drink of this people; wine and spirits are never used, nor even accepted when offered by the Dutch. Sakki, or rice beer, is clear as wine, and of an agreeable tafte: taken in quantity, it intoxicates for a few moments, and causes headach. Both men and women are fond of tobacco, which is in universal vogue and fmoked continually. The gardens about their houses. are adorned with a variety of flowers, trees, verdure, baths, terraces, and other embellishments. The furniture and decorations of the houses of persons of distinction confift in japan-work of various colours, curious paintings, beds, couches, skreens, cabinets, tables, a wariety of porcelain jars, vafes, tea-equipage, and other veffels and figures, together with fwords, guns, fcymitars, and other arms. Their retinues are more or less numerous and splendid according to their rank; but there are few of the lords who have less than 50 or

on horseback. As for their petty kings and princes, Japan they are seldom seen without 300 or 200 at least, when they either wait on the emperor, which is one half of the year, or attend him abroad.

When a prince or great man dies, there are commonly about 10, 20, or more youths of his household. and fuch as were his greatest favourites, who put themfelves to a voluntary death, at the place where the body is buried or burned; as foon as the funeral pile, confifting of odoriferous woods, gums, spices, oils, and other ingredients, is fet on fire, the relations and friends of the deceafed throw their prefents into it, fuch as cloaths, arms, victuals, money, fweet herbs, flowers, and other things which they imagine will be of use to him in the other world. Those of the middle or lower rank commonly bury their dead, without any other burning than that of fome odoriferous woods, gums, &c. The fepulchres into which the bones and athes of perfons of rank are deposited, are generally very magnificent, and fituated at fome distance from the towns.

The Dutch and Chinese are the only nations allowed to traffic in Japan. The Dutch at prefent fend but two ships annually, which are fitted out at Batavia, and fail in June, and return at the end of: the year. The chief merchandise is Japanese copper and raw camphor. The wares which the Dutch company import are, coarfe fugar, ivory, a great quantity of tin and lead, a little cast iron, various kinds of fine chintzes, Dutch cloth of different colours and fineness, ferge wood for dyeing, tortife-shell, and costus Arabicus, The little merchandise brought by the officers on: their own account, confifts of faffron, theriaca, fealingwax, glass-beads, watches, &c. &c. About the time when the Dutch ships are expected, sereral outposts are stationed on the highest hills by the government; they are provided with telescopes, and long before their arrival give the governor of Nagafaki notice. As foon as they anchor in the harbour, the upper and under officers of the Japanese immediately betake themselves onboard, together with interpreters; to whom is delivered a cheft, in which all the failors books, the muster-roll of the whole crew, fix fmall barrels of powder, fix barrels of balls, fix muskets, fix bayonets, fix pistols, and fix fwords, are deposited; this is supposed to be the whole remaining ammunition after the Imperial garrifon has been faluted. Thefe things are conveyed onfhore, and preferved in a feparate warehouse, nor are they returned before the day the ship quits the harbour.

Duties are quite unknown as well in the inland parts as on the coaft, nor are there any customs required either for exported or imported goods; an advantage enjoyed by few nations. But, to prevent the importation of any forbidden wares, the utmost vigilance is observed; then the men and things are examined with the eyes of Argus. When any European goes on shore, he is examined before he leaves the ship, and afterwards on his landing. This double fearch is exceedingly strict; fo that not only the pockets and cloaths are ftroaked with the hands, but the pudenda of the meaner fort are preffed, and the hair of the flaves. All the Japanese who come on board are fearched in like manner, except only their superior officers: fo also are the wares either exported or im-60 men richly clad and armed, some on foot, but most ported, first on board, and then at the factory, except

Japan, the great chefts, which are opened at the factory, and therefore retained even in the inflance of the papier Japanning Japanning fo carefully examined that they strike the very sides lest they should be hollow. The bed clothes are often opened, and the feathers examined : rods of iron are run into the pots of butter and confections: a square hole is made in the cheefe, and a long-pointed iron is thrust into it in all directions. Their fuspicion is carried fo far, that they take out and break one or two of the eggs brought from Batavia.

The interpreters are all natives; they fpeak Dutch in different degrees of purity. The government permits no foreigner to learn their language, left they should by means of this acquire the knowledge of the manufactures of the country; but forty or fifty interpreters are provided to ferve the Dutch in their trade,

or on any other occasion.

The interpreters are very inquifitive after European books, and generally provide themselves with some from the Dutch merchants. They peruse them with care, and remember what they learn. They befides endeavour to get instruction from the Europeans; for which purpose they ask numberless questions, particularly respecting medicine, physics, and natural history. Most of them apply to medicine, and are the only phyficians of their nation who practife in the European manner, and with European medicines, which they procure from the Dutch physicians. Hence they are able to acquire money, and to make themselves respected.

FAPAN Earth. See MIMOSA and TERRA Faponica. JAPANNING, the art of varnishing and drawing figures on wood, in the fame manner as is done by the

natives of Japan in the East Indies.

The fubitances which admit of being japanned are almost every kind that are dry and rigid, or not too flexible; as wood, metals, leather, and paper prepared.

Wood and metals do not require any other preparation, but to have their furface perfectly even and clean: but leather should be securely strained either on frames or on boards; as its bending or forming folds would otherwise crack and force off the coats of varnish: and paper should be treated in the same manner, and have a previous strong coat of some kind of fize; but it is rarely made the subject of japanning till it is converted into papier mache, or wrought by other means into fuch form, that its original ftate, particularly with respect to flexibility, is loft.

One principal variation from the method formerly used in japanning is, the using or omitting any priming or undercoat on the work to be japanned. In the older practice, fuch priming was always used; and is at prefent retained in the French manner of japanning coaches and fnuff-boxes of the papier mache; but in the Birmingham manufacture here, it has been always rejected. The advantage of using such priming or undercoat is, that it makes a faving in the quantity of varnish used; because the matter of which the priming is composed fills up the inequalities of the body to be varnished; and makes it easy, by means of rubbing and water-polithing, to gain an even furface for the varnish: and this was therefore such a convenience in the case of wood, as the giving a hardness and firmness to the ground was also in the case of Nº. 162.

mache by the French, who applied the received method of japanning to that kind of work on its introduction. There is nevertheless this inconvenience always attending the use of an undercoat of fize, that the japan coats of varnish and colour will be constantly liable to be cracked and peeled off by any violence, and will not endure near fo long as the bodies japanned in the fame manner, but without any fuch priming; as may be eafily observed in comparing the wear of the Paris and Birmingham fnuff-boxes; which latter, when good of their kind, never peel or crack, or fuffer any damage, unless by great violence, and fuch a continued rubbing as wastes away the substance of the varnish; while the japan coats of the Parisian crack and fly off in flakes, whenever any knock or fall, particularly near the edges, expose them to be injured. But the Birmingham manufacturers, who originally practifed the japanning only on metals, to which the reason above given for the use of priming did not extend, and who took up this art of themselves as an invention, of course omitted at first the use of any fuch undercoat; and not finding it more necessary in the instance of papier mache, than on metals, continue still to reject it. On which account, the boxes of their manufacture are, with regard to the wear, great-

The laying on the colours in gum-water, instead of varnish, is also another variation from the method of japanning formerly practifed : but the much greater ftrength of the work, where they are laid on in varnish or oil, has occasioned this way to be exploded with the greatest reason in all regular manufactures : however, they who may practice japanning on cabinets, or other fuch pieces as are not exposed to much wear and violence, for their amulement only, and confequently may not find it worth their while to encumber themfelves with the preparations necessary for the other methods, may paint with water-colours on an undercoat laid on the wood or other fubstance of which the piece to be japanned is formed; and then finish with the proper coats of varnish, according to the methods below taught: and if the colours are tempered with the strongest isinglass size and honey, instead of gumwater, and laid on very flat and even, the work will not be much inferior in appearance to that done by the other method, and will last as long as the old

ly better than the French.

Of JAPAN Grounds .- The proper grounds are either fuch as are formed by the varnish and colour, where the whole is to remain of one fimple colour; or by the varnish either coloured or without colour, on which fome painting or other decoration is afterwards to be laid. It is necessary, however, before we proceed to speak of the particular grounds, to show the manner of laying on the priming or undercoat, where any fuch is used.

This priming is of the fame nature with that called clear coating, or vulgarly clear coaling, practifed erroneoufly by the house-painters; and confists only in laying on and drying in the most even manner a compolition of fize and whiting, or fometimes lime instead of the latter. The common fize has been generally leather, that it became an established method; and is used for this purpose; but where the work is of a nicer

Japan. kind, it is better to employ the glover's or the parchment five; and if a third of ifinglass be added, it will be fill better, and, if not laid on too thick, much less liable to peel and crack. The work should be prepared for this priming, by being well fmoothed with the fish skin or glass-shaver; and, being made thoroughly clean, should be brushed over once or twice with hot fize, diluted with two thirds of water, if it be of the common frength. The priming should to the Arts, then be laid on with a brush as even as possible; and should be formed of a fize whose confistence is betwixt the common kind and glue, mixed with as much whiting as will give it a fufficient body of colour to hide the furface of whatever it is laid upon, but not

> If the furface be very clean on which the priming is used, two coats of it laid on in this manner will be fufficient; but if, on trial with a fine wet rag, it will not receive a proper water polish on account of any inequalities not fufficiently filled up and covered, two or more coats must be given it; and whether a greater or lefs number be used, the work should be smoothed, after the last coat but one is dry, by rubbing it with the Dutch rushes. When the last coat is dry, the water polish should be given, by passing over every part of it with a fine rag gently moistened, till the whole appear perfectly plain and even. The priming will then be completed, and the work ready to receive the painting or coloured varnish; the rest of the proceedings being the fame in this cafe as where no priming is

When wood or leather is to be japanned, and no priming is used, the best preparation is to lay two or three coats of coarfe varnish composed in the following

" Take of rectified spirit of wine one pint, and of coarfe feed lac and refin each two ounces. Diffolve the feed-lac and refin in the spirit; and then strain off the

This varnish, as well as all others formed of spirit of wine, must be laid on in a warm place; and, if it can be conveniently managed, the piece of work to be varnished should be made warm likewise: and for the cold or moisture chills this kind of varnish, and prevents its taking proper hold of the substance on which

When the work is fo prepared, or by the priming with the composition of fize and whiting above deferibed, the proper japan ground must be laid on. which is much the best formed of shell-lac varnish, and the colour defired, if white be not in question, which demands a peculiar treatment, or great brightness be not required, when also other means must be purfued.

The colours used with the shell-lac varnish may be any pigments whatever which give the teint of the ground defired; and they may be mixed together to form browns or any compound colours.

As metals never require to be undercoated with whiting, they may be treated in the fame manner as wood or leather, when the undercoat is omitted, except in the inflances particularly spoken of below.

White JAPAN Grounds - The forming a ground perfeetly white, and of the first degree of hardness, re-VOL. IX. Part I.

mains hither a defideratum, or matter fought for, in apan. the art of japanning, as there are no fubflances which form a very hard varnish but what have too much colour not to deprave the whitenefs, when laid on of a due thickness over the work.

The nearest approach, however, to a perfect white varnish, already known, is made by the following com-

" Take flake white, or white lead, washed over and ground up with a fixth of its weight of flarch, and then dried; and temper it properly for spreading with the mastich varnish prepared as under the article VAR-

" Lay thefe on the body to be japanned, prepared either with or without the undercoat of whiting, in the manner as above ordered; and then varnish it over with five or fix coats of the following varnish:

" Provide any quantity of the best feed lac; and pick out of it all the clearest and whitest grains, referving the more coloured and fouler parts for the coarse varnishes, such as that used for priming or preparing wood or leather. Take of this picked feed lac two ounces, and of gum animi three ounces; and diffolve them, being previously reduced to a gross powder, in about a quart of spirit of wine; and strain off the clear varnish."

The feed-lac will yet give a flight tinge to this composition; but cannot be omitted where the varnish is wanted to be hard; though, when a fofter will answer the end, the proportion may be diminished, and a little crude turpertine added to the gum-animi to take off the brittlenefs.

A very good varnish, free entirely from all brittleness, may be formed by diffolving as much gum-animi as the oil will take, in old nut or poppy oil; which must be made to boil gently when the gum is put into it. The ground of white colour itself may be laid on in this . varnish, and then a coat or two of it may be put over the ground; but it must be well diluted with oil of turpentiae when it is used. This, though free from brittleness, is nevertheless liable to fuffer by being indented or bruifed by any flight flrokes; and it will not well bear any polish, but may be brought to a very fmooth furface without, if it be judiciously managed in the laying it on. It is likewife fomewhat tedious in drying, and will require fome time where feveral coats are laid on; as the last ought not to contain much

Blue FAPAN Grounds .- Blue japan grounds may be formed of bright Prussian blue, or of verditer glazed over by Pruffian blue, or of fmalt. The colour may be best mixed with shell-lac varnish, and brought to a polishing state by five or fix coats of varnish of feedlac : but the varnish, nevertheless, will somewhat injure the colour by giving to a true blue a call of green, and fouling in some degree a warm blue by the yellow it contains : where, therefore, a bright blue is required, and a less degree of hardness can be dispensed with, the method before directed in the cafe of white grounds must be purfued.

Red FAPAN Grounds .- For a fearlet japan ground. vermilion may be used : but the vermilion has a glaring effect, that renders it much less beautiful than the crimfon produced by glazing it over with carmine or fine lake; or even with rofe-pink, which has a very good

crimfon, nevertheless, instead of glazing with carmine, the Indian lake should be used, dissolved in the spirit of which the varnish is compounded, which it readily admits of when good: and, in this case, instead of glazing with the shell-lac varnish, the upper or polishing coats need only be used; as they will equally recrive and convey the tinge of the Indian lake, which may be actually diffolved by fpirit of wine : and this will be found a much cheaper method than the using carmine. If, nevertheless, the highest degree of brightness be required, the white varnishes must be used.

Tellow JAPAN Grounds .- For bright yellow grounds, the king's yellow, or the turpeth mineral, fhould be employed, either alone or mixed with fine Dutch pink : and the effect may be still more heightened by diffolving powdered turmeric-root in the spirit of wine of which the upper or polishing coat is made; which spirit of wine mult be strained from off the dregs before the feed-lac be added to it to form the varnish.

The feed-lac varnish is not equally injurious here, and with greens, as in the case of other colours; because, being only tinged with a reddish yellow, it is little more than an addition to the force of the colours.

Yellow grounds may be likewife formed of the Dutch pink only; which, when good, will not be wanting in

brightness, though extremely cheap.

Green FAPAN Grounds .- Green grounds may be produced by mixing the king's yellow and bright Pruffian blue, or rather the turpeth mineral and Pruffian blue; and a cheap, but fouler kind, by verdegris with a little of the abovementioned yellows, or Dutch pink. But where a very bright green is wanted, the crystals of verdegris, called distilled verdegris, should be employed; and to heighten the effect they should be laid on a ground of leaf-gold, which renders the colour extremely brilliant and pleafing.

They may any of them be used successfully with good feed-lac varnish, for the reason before given; but

will be ftill brighter with white varnish.

Orange-coloured FAPAN Grounds .- Orange-coloured japan grounds may be formed by mixing vermilion or red-lead with king's yellow, or Dutch pink; or the orange-lac, which will make a brighter orange ground than can be produced by any mixture.

Purple JAPAN Grounds .- Purple japan grounds may be produced by the mixture of lake and Pruffian blue; or a fouler kind, by vermilion and Pruffian blue. They may be treated as the rest with respect to the varnish.

Black JAPAN Grounds to be produced without Heat .-Black grounds may be formed by either ivory-black or lamp-black; but the former is preferable where it is perfectly good.

These may be always laid on with shell-lac varnish : and have their upper or polishing coats of common feed-lac varnish, as the tinge or foulness of the varnish

can be here no injury.

Common Black JAPAN Grounds on Iron or Copper, produced by means of Heat. — For forming the common black japan grounds by means of heat, the piece of work to be japanned must be painted over with drying oil; and, when it is of a moderate dryness, must be put into a flove of fuch degree of heat as will change the oil to black, without burning it fo as to deftroy or weaken its tenacity. The flove should not be too hot

Japan. good effect used for this purpose. For a very bright when the work is put into it, nor the heat increased Japan. too fast; either of which errors would make it blifter: but the flower the heat is augmented, and the longer it is continued, provided it be restrained within the due degree, the harder will be the coat of japan. This kind of varnish requires no polish, having received, when properly managed, a fufficient one from the heat.

The fine Tortoife-feell FAPAN Ground produced by means of Heat .- The best kind of tortoise-shell ground produced by heat is not less valuable for its great hardness, and enduring to be made hotter than boiling water without damage, than for its beautiful appearance. It is to be made by means of a varnish prepared in the following manner:

" Take of good linfeed-oil one gallon, and of umbre half a pound: boil them together till the oil become very brown and thick : ftrain it then through a coarfe cloth, and fet it again to boil; in which state it must be continued till it acquire a pitchy confiftence; when

it will be fit for use."

Having prepared thus the varnish, clean well the iron or copper plate or other pieces which is to be japanned; and then lay vermilion tempered with shelllac varnish, or with drying-oil diluted with oil of turpentine, very thinly, on the places intended to imitate the more transparent parts of the tortoise-shell. When the vermilion is dry, brush over the whole with the black varnish, tempered to a due confistence with oil of turpentine; and when it is fet and firm, put the work into a stove, where it may undergo a very ftrong heat, and must be continued a considerable time; if even three weeks or a month, it will be the

This was given amongst other receipts by Kunckel: but appears to have been neglected till it was revived with great fuccess in the Birmingham manufactures, where it was not only the ground of fnuff-boxes, drefsing-boxes, and other fuch leffer pieces, but of those beautiful tea-waiters which have been fo justly esteemed and admired in feveral parts of Europe where they have been fent. This ground may be decorated with painting and gilding, in the fame manner as any other varnished furface, which had best be done after the ground has been duly hardened by the hot stove; but it is well to give a fecond annealing with a more gentle heat after it is finished.

Method of painting JAPAN Work .- Japan work ought properly to be painted with colours in varnish; though, in order for the greater dispatch, and, in some very nice works in fmall, for the freer use of the pencil, the colours are fometimes tempered in oil; which should previously have a fourth part of its weight of gumanimi diffolved in it; or, in default of that, of the gums fandarac or mastich. When the oil is thus used, it should be well diluted with spirit of turpentine, that the colours may be laid more evenly and thin; by which means, fewer of the polishing or upper coats of

varnish become necessary.

In fome inflances, water-colours are laid on grounds of gold, in the manner of other paintings; and are best, when so used, in their proper appearance, without any varnish over them; and they are also sometimes so managed as to have the effect of emboffed work. The colours employed in this way, for painting, are best

prepared by means of ifinglass fize corrected with honey or fugar-candy. The body of which the emboffed work is raifed, need not, however, be tinged with the exterior colour; but may be best formed of very strong gum-water, thickened to a proper confittence by bolearmenian and whiting in equal parts; which being laid on the proper figure, and repaired when dry, may be then painted with the proper colours tempered in the ifinglass fize, or in the general manner with shell-lac varnish.

Manner of Varnishing JAPAN Work .- The last and finishing part of japanning lies in the laying on and polithing the outer coats of varnish; which are necesfary, as well in the pieces that have only one fimple ground of colour, as with those that are painted. This is in general best done with common feed-lac varnish, except in the inflances and on those occasions where we have already flown other methods to be more expedient: and the same reasons which decide as to the fitness or impropriety of the varnishes, with respect to for use." the colours of the ground, hold equally with regard to those of the painting; for where brightness is the most material point, and a tinge of yellow will injure it, feed lac must give way to the whiter gums; but where hardness, and a greater tenacity, are most effential, it must be adhered to; and where both are so neceffary, that it is proper one should give way to the other in a certain degree reciprocally, a mixed varnish must be adopted.

This mixed varnish, as we have already observed, should be made of the picked feed lac. The common feed-lac varnish, which is the most useful preparation of the kind hitherto invented, may be thus

" Take of feed-lac three ounces, and put it into water to free it from the sticks and filth that are frequently intermixed with it; and which must be done by flirring it about, and then pouring off the water, and adding fresh quantities in order to repeat the operation, till it be freed from all impurities, as it very effectually may be by this means. Dry it then, and powder it grossly, and put it, with a pint of rectified fpirit of wine, into a bottle, of which it will not fill above two thirds. Shake the mixture well together; and place the bottle in a gentle heat, till the feed appear to be diffolved; the shaking being in the mean time repeated as often as may be convenient: and then pour off all that can be obtained clear by this method, and firain the remainder through a coarfe cloth. The varnish thus prepared must be kept for use in a bottle well flopt."

When the spirit of wine is very strong, it will diffolve a greater proportion of the feed lac: but this will iaturate the common, which is feldom of a ftrength fufficient for making varnishes in perfection. As the chilling, which is the most inconvenient accident attending those of this kind, is prevented, or produced more frequently, according to the itrength of the fpirit; we shall therefore take this opportunity of showing a method by which weaker rectified spirits may with great eafe, at any time, he freed from the phlegm, and rendered of the first degree of

"Take a pint of the common rectified spirit of

above three parts. Add to it half an ounce of pearl- Japan. ashes, salt of tartar, or any other alkaline salt, heated red-hot, and powdered, as well as it can be without much loss of its hear. Shake the mixture frequently for the space of half an hour; before which time, a great part of the phlegm will be separated from the fpirit, and will appear, together with the undiffolved part of the falts, in the bottom of the bottle. Let the fpirit then be poured off, or freed from the phleam and falts, by means of a tritorium or feparating funnel; and let half an ounce of the pearl-ashes, heated and powdered as before, be added to it, and the fame treatment repeated. This may be done a third time, if the quantity of phlegm separated by the addition of the pearl ashes appear considerable. An ounce of alum reduced to powder and made hot, but not burnt, mult then be put into the ipirit, and fuffered to remain fome hours; the bottle being frequently shaken : after which, the spirit, being poured off from it, will be fit

The addition of the alum is necessary, to neutralize the remains of the alkaline falt or pearl-ashes; which would otherwife greatly deprave the spirit with re pect to varnishes and laquer, where vegetable colours are concerned; and must confequently render another distil-

lation necessary.

The manner of using the feed lac or white varnishes is the same, except with regard to the substance used in polishing; which, where a pure white or great clearness of other colours is in question, should be itfelf white : whereas the browner forts of polifhing duft, as being cheaper, and doing their business with greater dispatch, may be used in other cases. The pieces of work to be varnished should be placed near a fire, or in a room where there is a stove, and made perfectly dry; and then the varnish may be rubbed over them by the proper brushes made for that purpose, beginning in the middle, and passing the brush to one end; and then with another stroke from the middle, passing it to the other. But no part should be crossed or twice passed over, in forming one coat, where it can possibly be avoided. When one coat is dry, another must be laid over it; and this must be continued at least tive or fix times, or more, if on trial there be not fufficient thickness of varnish to bear the polish, without laying bare the painting or the ground colour underneath.

When a fufficient number of coats is thus laid on. the work is fit to be polished: which must be done, in common cases, by rubbing it with a rag dipped in Tripoli or pumice-stone, commonly called rotten flone, finely powdered: but towards the end of the rubbing, a little oil of any kind should be used along with the powder; and when the work appears fufficiently bright and gloffy, it should be well rubbed with the oil alone, to clean it from the powder, and give it a still brighter

In the case of white grounds, instead of the Tripoli or pumice-stone, fine putty or whiting must be used; both which should be washed over to prevent the danger of damaging the work from any fand or other gritty matter that may happen to be commixed with

It is a great improvement of all kinds of japan wine, and put it into a bottle, of which it will not fill work, to harden the varnish by means or heat; which,

Japheth in every degree that it can be applied foort of what would burn or calcine the matter, tends to give it a more firm and ftrong texture. Where metals form the body, therefore, a very hot stove may be used, and the pieces of work may be continued in it a confiderable time; especially if the heat be gradually increased: but where wood is in question, heat must be sparingly used, as it would otherwise warp or shrink the body, fo as to injure the general figure.

JAPHETH, the fon of Noah. His descendants posfeffed all Europe and the isles in the Mediterranean, as well those which belong to Europe, as others which depend on Afia. They had all Afia Minor, and the northern parts of Asia above the sources of the Tigris and Euphrates. Noah, when he bleffed Japheth, faid to him, "God shall enlarge Japheth, and he shall dwell in the tents of Shem; and Canaan shall be his fervant." This bleffing of Noali was accomplished, when the Greeks, and after them the Romans, carried their conquests into Atia and Africa, where were the dwelling

and dominions of Shem and Canaan.

The fons of Japheth were Gomer, Magog, Madai, Javan, Tubal, Meshech, and Tiras. The scripture fays, "that they peopled the ifles of the Gentiles, and fettled in different countries, each according to his language, family, and people." It is supposed, that Gomer was the father of the Cimbri, or Cimmerians; Magog of the Scythians; Madai of the Macedonians or Medes; Javan of the Ionians and Greeks; Tubal of the Tibarenians; Meshech of the Muscovites or Ruffians; and Tiras of the Thracians. By the isles of the Gentiles, the Hebrews understand the isles of the Mediterranean, and all the countries separated by the fea from the continent of Palestine; whither also the Hebrews could go by fea only, as Spain, Gaul, Italy, Greece, Afia Minor.

Japheth was known by profane authors under the name of Japetus. The poets make him the father of heaven and earth. The Greeks believe that he was the father of their race, and ackowledged nothing more ancient than him. Besides the feven sons of Japheth above mentioned, the Septuagint, Eusebius, the Alexandrian Chronicle, and St Austin, give him an eighth called Eliza, who is not mentioned either in the Hebrew or Chaldee, and the eaftern people affirm that

Tapheth had eleven children.

JAPYDIA (anc. geog.), a western district of Illyricum anciently threefold; the first Japydia extending from the fprings of the Timavus to Iftria; the fecond, from the river Arfia to the river Tedanius; and the third, called Inalpina, fituated in mount Albius and the other Alps, which run out above Istria. Japodes, or Japydes, the people. Now constituting the fouth part of Carniola, and the west of Austrian Croatia.

JAPYGIA, CALABRIA, anciently fo called by the

Greeks. Japyges, the people. JAPYGIUM (anc. geog.), a promontory of Calabria;

called alfo Salentinum. Now Capo di S. Maria di Leuca. JAQUELOT (Isaac), a celebrated French Protestant divine, born in 1647, at Vasfy in Champagne, where his father was minister. The revocation of the edict of Nantz obliging him to quit France, he took

refuge first at Heidelberg, and then at the Hague, where he procured an appointment in the Walloon church. Here he continued till that capital was taken by the king of Pruffia, who, hearing him preach, made him his French minister in ordinary at Berlin; to which city he removed in 1702. While he lived at Berlin, he entered into a warm controverly with M. Bayle on the doctrine advanced in his dictionary favouring manichæism, which continued until death imposed filence on both parties: and it was in this difpute that M. Jaquelot openly declared in favour of the Remonstrants. He wrote, among other works, 1. Differtations sur l'existence de Dieu. 2. Dissertations sur le Messie. 3. Lettres a Messieures les Prelats de l'Eglise Gallicane. He was employed in finishing an important work upon the divine authority of the holy scriptures, when he died fuddenly in 1708, aged 61.

JAR, or JARR, an earthen pot or pitcher, with a big belly and two handles. - The word comes from the Spanish jarra or jarro, which fignify the same.

JAR is used for a fort of measure or fixed quantity of divers things .- The jar of oil is from 18 to 26 gallons; the jar of green ginger is about 100 pounds

JARCHI (Solomon), otherwise Raschi and Isaaki Solomon, a famous rabbi, born at Troyes in Champagne, who flourished in the 12th century. He was a perfect mafter of the talmud and gemara; and he filled the postils of the bible with so many talmudical reveries, as totally extinguished both the literal and moral fense of it. A great part of his commentaries are printed in Hebrew, and some have been translated into Latin by the Christians. They are all greatly efteemed by the Jews, who have bestowed on the au-

thor the title of prince of commentators.

JARDYN, or JARDIN, (Karel du), painter of converfations, landfcapes, &c. was born at Amsterdam in 1640, and became a difciple of Nicholas Berchem. He travelled to Italy whilft he was yet a young man; and arriving at Rome, he gave himfelf up alternately to ftudy and diffipation. Yet, amidft this irregularity of conduct, his proficiency in the art was furprifing; and his paintings rofe into fuch high repute, that they were exceedingly coveted in Rome, and bought up at great prices. With an intention to visit his native city he at last left Rome; but passing through Lyons, and meeting some agreeable companions, they prevailed on him to ftay there for fome time, and he found as much employment in that city as he could possibly undertake or execute. But the profits which arofe from his paintings were not proportionable to his profusion; and in order to extricate himself from the encumbrances in which his extravagance had involved him, he was induced to marry his hoftels, who was old and difagreeable, but very rich. Mortified and ashamed of that adventure, he returned as expeditiously as possible to Amsterdam, accompanied by his wife, and there for fome time followed his profession with full as much success as he had met with in Italy or Lyons. He returned to Rome the fecond time; and after a year or two fpent there in his usual extravagant manner, he fettled at Venice. In that city his merit was well known before his arrival, which procured him a very honourable reception. He lived there highly careffed, and continually employed; but died at the age of 38. He was sumptuously interred, out of respect to his talents; and although a Protestant, permitted to be laid in confecrated ground. This painter, in his colouring and touch, refembled his mafter Ber-

Jargen chem: but he added to that manner a force which diflinguishes the great masters of Italy; and it is observed, that most of his pictures feem to express the warmth of the fun, and the light of mid day. His pictures are not much encumbered; a few figures, fome animals, and a little landscape for the back-grounds, generally comprise the whole of his composition. However, some of his subjects are often more extensive, containing more objects, and a larger defign. His works are as much fought after, as they are difficult to be met with.

JARGON, a kind of precious stone, of the nature of the diamond, but fofter; found in Brafil according to M. de Bomare; but in Ceylon, according to M. Rome de L'Isle. Its specific gravity is nearly equal to that of the ponderous spar, being 4416. Its crystals confift of two tetrahedral pyramids of equal fides, feparated by a (hort prifm; fo that the jargon is properly of a dodecahedral form. According to some lapidaries, the jargon comes nearest to the sapphire in hardness: and as they have when cut and polished a great refemblance to the diamond, they are also called by some foft diamonds; and one may be eafily imposed upon in purchafing these for the true kind, when they are made up in any fort of jewellery work. On exposing this stone to a violent fire, M. D'Arcot found the furface a little vitrified where it fluck to the porcelain test in which it was fet ; whence it appears, that the jargon has not the least resemblance to the diamond, which is destructible by fire. See DIAMOND.

JARIMUTH, JARMUTH, or Ferimoth, Josh. XV. a town reckoned to the tribe of Judah, four miles from Eleutheropolis, westward, (Jerome). Thought to be the fame with Ramoth and Remeth, Joshua xix. and

Nehem. x. 2. (Reland).

JARNAC, a town of France, in Orleanois and in Angumois, remarkable for a victory gained by Henry III. over the Huguenots in 1569. It is feated on the river Charente, in W. Long. o. 13. N. Lat.

45. 40.

JAROSLOW, a handsome town of Poland, in the palatinate of Russia, with a strong citadel. It is remarkable for its great fair, its handsome buildings, and a battle gained by the Swedes in 1656, after which they took the town. It is feated on the river Saine, in E. Long. 22. 23. N. Lat. 49. 58.

JASHER (The book of). This is a book which Joshua mentions, and refers to in the following pasfage: " And the fun flood still, and the moon stayed, until the people had avenged themselves upon their enemies: is not this written in the book of Jasher?"

It is difficult to determine what this book of Fasher, or "the upright," is. St Jerom and the Jews believed it to be Genesis, or some other book of the Pentateuch, wherein God foretold he would do wonderful things in favour of his people. Huetius supposes it was a book of morality, in which it was faid that God would subvert the course of nature in favour of those who put their trust in him. Others pretend, it was public annals, or records, which were ftyled juffice or upright, because they contained a faithful account of the history of the Uraelites. Grotius believes, that this book was nothing else but a and the striped varieties by grafting or budding on fong, made to celebrate this miracle and this victory. Rocks of the common kind .- The other three species,

words cited by Joshua as taken from this work, Jasione "Sun, fland thou itill upon Gibeon, and thou moon in the valley of Ajalon," are fuch poetical expressions as do not fuit with historical memoirs; besides that in the 2d book of Samuel (i. 18.) mention is made of a book under the fame title, on account of a fong made on the death of Saul and Jonathan.

JASIONE, in botany: A genus of the monogamia order, belonging to the fyngenefia class of plants; and in the natural method ranking under the 20th order. Campanacee. The common calyx is ten-leaved; and the corolla has five regular petals; the capfule beneath,

two celled.

JASMINE. See JASMINUM.

Arabian FASMINE. See NYCTANTHES.

JASMINUM, JASMINE, or Jeffamine-tree, in botany: A genus of the monogynia order, belonging to the diandria class of plants; and in the natural method ranking under the 44th order, Sepiariea. The corolla is quinquefid, the berry dicoccous; the feeds arillated, the antheræ within the tube.

Species. 1. The officinalis, or common white jafmine, hath fhrubby long flender ftalks and branches, rifing upon support 15 or 20 feet high, with numerous white flowers from the joints and ends, of a very fragrant odour. There is a variety with white-firiped, and another with yellow-ftriped leaves. 2. The fruticans, or shrubby yellow jasmine, hath shrubby, angular, trailing stalks and branches, rising upon support eight or ten feet high; trifoliate and fimple alternate leaves; with yellow flowers from the fides and ends of the branches, appearing in June; frequently producing berries of a black colour. This faccies is remarkable for fending up many fuckers from its roots: often fo plentifully as to overspread the ground, if not taken up annually. 3. The humilis, or dwarf yellow jasmine, hath shrubby firm stalks, and angular branches, of low, fomewhat robust and bushy growth; broad, trifoliate, and pinnated leaves; and large yellow flowers in July, fometimes fucceeded by berries. 4. The grandiflorum, or great-flowered Catalonian jasmine, hath a shrubby firm upright stem, branching out into a fpreading head from about three to fix or eight feet high, with large flowers of a blufh red colour without, and white within, appearing from July to November. Of this there is a variety with femi-double flowers, having two feries of petals. 5. The azoricum, or azorian white jasmine, hath shrubby, long slender stalks and branches, riting upon support 15 or 20 feet high, with pretty large flowers of a pure white colour; coming out in loofe bunches from the ends of the branches, and appearing most part of the summer and autumn. 6. The odoratiffimum, or most fweet-scented yellow Indian jasmine, hath a shrubby upright stalk branching erect. without fupport, fix or eight feet high, with bright yellow flowers in bunches from the ends of the branches; flowering from July till October, and emitting a most fragrant odour.

Culture. The three first species are sufficiently hardy to thrive in this climate without any shelter. They may be eafily propagated by layers and cuttings; This feems the more probable opinion, because the which are tender, may also be increased by layers, or

Jaton feeds, or by grafting and budding them upon the clay very full of iron. The mineral acids have no ef- Japonyx. common white and shrubby yellow jasmine. They require shelter in a green house in winter, and therefore must always be kept in pots to move them out and in occasionally. The pots must be filled with light, rich earth, frequently watered in fummer, and about once a week in winter, but always moderately during that feafon. Prune off all the decayed wood at any time when it appears, and shorten or retrench the rambling shoots as you see occasion, to preserve the heads fomewhat regular; managing them in other respects as the common green house plants.

IASON, the Greek hero who undertook the Argonautic expedition, the history of which is obscured by fabulous traditions, flourished about 937 B. C. See

ARGONAUTS.

JASPACHATES. See JADE STONE.

JASPER, in natural history, a genus of stones belonging to the filiceous class. According to Cronstedt, all the opaque flints are called by this name whose texture refembles dry clay, and which cannot be any other way diffinguished from flints, except that they are more easily melted; which perhaps may also proceed from a mixture of iron. The species are,

1. Pure jasper; which, Cronstedt informs us, cannot be decompounded by any means hitherto known; tho' Mr Kirwan fays that it contains 75 per cent. of filex; 20 of argil, and about five of calx of iron. The specific gravity is from 2680 to 2778. It is found of different colours; viz. green with red dots from Egypt, called also the beliotrope, or blood flone; quite green from Bohemia; red from Italy, called there diaspro rosso, or yellow, called melites by the ancients; a name according to Pliny, of the same import with male coloris. It is also found red with yellow spots and veins, in Sicily, Spain, and near Constantinople, called by the Italians diaspro florido; or black from some places in Sweden, called by the Italians paragone antico.

2. Jaspis martialis, or sinople, containing iron. This is a dark red stone containing 18 or 20 per cent. of metal. Near Chemnitz, where it forms very confiderable veins, as Brunnich informs us, it has frequently specks of marcafite, cubic lead ores, and blend. It has likewife fo much gold as to be worth working: there is likewife a firiped finople of various colours. There are feveral varieties differing in the coarfeness and fineness of their texture, as well as the shade of their colour; varying from a deep brown to a yellow. The laft is at-

tracted by the magnet after calcination.

Cronstedt observes that jasper, when fresh broken, so nearly refembles a bole of the same colour, that it can only be diftinguished by its hardness. In the province of Dalarne in Sweden, it is found in a kind of hard fand-ftone; in other places it is found within fuch unctuous clefts as are usually met with in Colnish clay, red chalk, and other fubftances of that kind. There are likewise some jaspers that imbibe water; from whence, and other confiderations, our author is of opinion that they have clay for their basis, notwithstanding their hardness. According to Magellan, it resitts the blowpipe per se, and is only partially foluble with the mineral alkali; separating into small particles with effervescence: with borax or microcosmic salt it melts without any effervescence. Bergman, in his Sciagraphia, informs us, that it is composed of filiceous earth united to a bush, the leaves of which are quinquepartite, with lobes

fect upon it in a short time, but corrode it by some Jatropha. months immersion. On treating a small piece of green jasper with vitriolic acid, some crystals of alum and green vitriol were obtained; which shows that iron and clay are ingredients in its composition. M. Daubenton mentions 15 varieties of this substance. 1. Green, from Bohemia, Silefia, Siberia, and the shores of the Caspian sea; which seems to be the pavonium of Aldrovandus. 2. The diaspro rosso, or red jasper; less common, and in smaller masses, than the green. 3. Yellow from Freyberg and Rochtliz; fometimes of a citron colour, and appearing as if composed of filky filaments; commonly called the filk jasper. 4. Brown from Dalecarlia in Finland and Sweden. 5. The violet from Siberia. 6. The black from Sweden, Saxony, and Finland. 7. The bluish-grey, a very rare species. 8. The milky white mentioned by Pliny, and found in Dalecarlia. 9. The variegated with green, red, and yellow clouds. 10. The blood ftone, green with red fpecks, from Egypt, which was supposed to stop the blood. 11. The veined with various colours. Sometimes these veins have a distant resemblance to various letters, and then the jasper is named by the French jaspe grammatique. Some of these found near Rochelle in France, on account of their curious variety in this respect, are named polygrammatiques. 12. The jasper with various coloured zones. 13. That called florito by the Italians; which has various colours mixed promifcuoufly without any order. 14. When the jasper has many colours together, it is then (very improperly) called univerfal. 15. When it contains fome particles of agate, it is then called agatifed jasper.

JASPONYX, in natural history, the purest horncoloured onyx, with beautiful green zones, which are composed of the genuine matter of the finest jaspers.

See TASPER and ONYX

JA I'ROPHA, the CASSADA PLANT: A genus of the monodelphia order, belonging to the monœcia class of plants; and in the natural method ranking under the 38th order, Tricocca. There is no male calyx; the corolla is monopetalous, and funnel-shaped; there are ten stamina, one alternately longer than the other. There is no female calyx; the corolla is pentapetalous, and patent; there are three bifid ftyles; the capfule is trilocular, with one feed in each cell. There are nine

Species. Of these the most remarkable are the following: 1. The curcas, or English physic-nut, with leaves cordate and angular, is a knotty shrub growing about 10 or 12 feet high. The extremities of the branches are covered with leaves; and the flowers, which are of a green herbaceous kind, are fet on in an umbel fashion round the extremities of the branches, but especially the main stalks. These are succeeded by as many nuts, whole outward tegumen is green and hufky; which being p cled off, thic vers the nut, whose sheil is black, and easily cracked: Thi contains an almond like kernel, divided into two parts; between which feparation lie two milk white thin membranaceous leaves, eafily feparable from each other. Thefe have not only a bare refemblance of perfect leaves, but have, in particular, every part, the ftalk, the middle tib, and transverse ones, as visible as any leaf what soever. 2. The goffypifolia. cotton-leaved jatropha or belly-ach

Jatropha. ovate and entire, and glandular branchy briftles. The ftem, which is covered with a light greyish bark, grows to about three or four feet high, foon dividing into feveral wide extended branches. These are neither decorated with leaves nor flowers till near the top, which is then furrounded by the former: Their footstalks, as well as the young buds on the extremity of the branches, are guarded round with stiff hairy briftles, which are always tipt with glutinous liquid drops. From among these rise several small deep-red pentapetalous flowers, the piftil of each being thick fet at the top with yellow farinaceous dust which blows off when ripe : these flowers are succeeded by hexagonal hufky blackish berries, which when ripe open by the heat of the fun, emitting a great many fmall dark-coloured feeds, which ferve as food for grounddoves. The leaves are few; but feldom or never drop off, nor are eaten by vermin of any kind. 3. The multifida, or French phyfic-nut, with leaves many parted and polished, and slipules bristly and multifid, grows to be ten feet high. The main stalk divides into very few branches, and is covered with a greyish white bark. The leaves fland upon fix-inch footflalks, furrounding the main stalk, generally near the top, in an irregular order. The flowers grow in bunches, umbel fashion, upon the extremities of each large stalk, very much resembling, at their first appearance, a bunch of red coral; these afterwards open into small tive-leaved purple flowers, and are fucceeded by nuts, which refemble those of the first species. 4. The manihot, or bitter cassada, has palmated leaves; the lobes lanceolate, very entire, and polished. 5. The janipha, or fweet caffada, has palmated leaves, with lobes very entire; the intermediate leaves lobed with a finus on both fides. 6. The elattica, with ternate leaves, elliptic, very entire, hoary underneath, and longly petioled. See figures of the two last on Plates CCXLVIII. and CCXLIX. which renders a more particular description unneceffury.

Properties, &c. The first species, a native of the West Indies, is planted round negro gardens. A decoction of the leaves of it, and of the second species (which grows wild), Dr Wright informs us, is often used with advantage in spasmodic belly-ach. attended with vomiting: it fits eafier on the stomach than any thing elfe, and feldom fails to bring about a discharge by stool. The third species, a native of the same countries, is cultivated there as an ornamental shrub. The feeds of all the three are draftic purgatives and emetics: and they yield, by decoction, an oil of the fame uses and virtues as the oleum ricini. See Rici-

The 4th and 5th species, the janipha and manihot, are natives of Africa and the West Indies, where they are cultivated as articles of food. It is difficult, Dr Wright fays, to diftinguish the bitter from the sweet caffada by the roots: but it will be best to avoid those of the cassada that bears flowers, as it is the bitter, which is poisonous when raw.

The root of bitter cassada has no fibrous or woody filaments in the heart, and neither boils nor roalts foft. The fweet caffada has all the opposite qualities. The bitter, however, may be deprived of its noxious qualities (which refide in the juice) by heat. Caffada

grated into a tub or trough : after this they are put Java. into a hair bag, and strongly pressed with a view to squeeze out the juice, and the meal or farina is dried in a hot stone-bason over the fire: it is then made into cakes. It also makes excellent puddings, equal to millet .- The scrapings of fresh bitter cassada are fuccefsfully applied to ill-difposed ulcers .-- Caffada roots yield a great quantity of ftarch, which the Brafilians export in little lumps under the name of tapioca. According to Father Labat, the small bits of manioc which have escaped the grater, and the clods which have not passed the sieve, are not useless. They are dried in the flove after the flour is roafted, and then pounded in a mortar to a fine white powder, with which they make foup. It is likewife used for making a kind of thick coarse cassada, which is roasted till almost burnt; of this, fermented with molaffes and West-India potatoes, they prepare a much esteemed drink or beverage called ouycou. This liquor, the favourite drink of the natives, is fometimes made extremely strong, especially on any great occasion, as a feast; with this they get intoxicated, and, remembering their old quarrels, maffacre and murder each other. Such of the inhabitants and workmen as have not wine, drink ouycou. It is of a red-colour, strong, nourishing, refreshing, and easily inebriates the inhabitants, who foon accustom themselves to it as easily as beer.

The 6th species is the Hevea Guianensis of Aublet +, + Histoire or tree which yields the elaftic refin called caoutchouc des Plantes or India rubber; for a particular account of which, fee de la Guiane the article CAOUTCHOUC. Our figure is copied from Françoife,. Aublet's tab. 335. and not from the erroneous plate P. 87.

given in the Ada Parifiana.

JAVA, a large island of the East Indies, lying between 105° and 116° E. Long, and from 6° to 8° S. Lat. extending in length 700 miles, and in breadth about 100. It is fituated to the fouth of Borneo, and fouth east from the peninfula of Malacca, having Sumatra lying before it, from which it is feparated by a narrow paffage, now fo famous in the world by the name of the Straits of Sunda. The country is mountainous and woody in the middle; but a flat coaft, full of bogs and marshes, renders the air unhealthful. It produces pepper, indigo, fugar, tobacco, rice, coffee, cocoa-nuts, plantains, cardamoms, and other tropical fruits. Gold alfo, but in no great quantities, hath been found in it. It is divertified by many mountains, woods, and rivers; in all which nature has very bountifully bestowed her treasures. The mountains are many of them so high as to be seen at the distance of three or four leagues. That which is called the Blue Mountain is by far the highest of them all, and scen the farthelt off at fea. They have frequent and very terrible earthquakes in this island, which shake the city of Batavia and places adjacent, to fuch a degree, that the fall of the houses is expected every moment. The waters in the road are excessively agitated, infomuch that their motion refembles that of a boiling pot: and in fome places the earth opens, which affords a ftrange and terrible spectacle. The inhabitants are of opinion, that thefe earthquakes proceed from the mountain Parang, which is full of fulphur, faltpetre, and bitumen. The fruits and plants of this island are all in their feveral kinds excellent, and almost out of numbread, therefore, is made of both the bitter and fweet, ber. There are abundance of forests scattered over it, thus :- The roots are washed and scraped clean; then, in which are all kinds of wild beasts, such as buffaloes,

tygers, rhinocerofes, and wild horses, with an infinite the midft of the town, and forms 15 canals of runvariety of ferpents, some of them of an enormous fize. nin water, all faced with fre stone, and adorned Crocodiles are prodigiously large in Java, and are found chiefly about the mouths of rivers; for, being amphibious animals, they delight mostly in marshes and favannahs. This creature, like the tortoife, lays its eggs in the hot fands, without taking any further care of them; and the fun hatches them at the proper feafon, when they run inflantly into the water. There is, in fhort, no kind of animal wanting here: fowls they have of all forts, and exquifitely good, especially peacocks, partridges, pheafants, wood-pigeons: and, for curiofity, they have the Indian bat, which differs little in form from ours; but its wings, when extended, measure a full yard, and the body of it is of the fize of a rat. They have fish in great plenty, and very good; fo that for the value of three pence there may be e-nough bought to dine fix or feven men. They have likewife a multitude of tortoifes, the flesh of which is very little inferior to veal, and there are many who

It is faid, that there are in the island upwards of 40 great towns, which, from the number of their inhabitants, would, in any other part of the world, merit the title of cities; and more than 4500 villages, befides hamlets, and ftraggling houses, lying very near each other, upon the fea-coaft, and in the neighbourhood of great towns: hence, upon a fair and moderate computation, there are within the bounds of the whole island, taking in persons of both sexes, and of all ranks and ages, more than thirty millions of fouls; fo that it is thrice as populous as France, which, though twice as big, is not computed to have more than twenty millions of inhabitants.

There are a great many princes in the island, of which the most considerable are, the emperor of Materan, who refides at Katafura, and the kings of Bantam and Japara. Upon the first of these many of the petty princes are dependant; but the Dutch are abfolute mafters of the greatest part of the island, particularly of the north coast, though there are some of the princes beyond the mountains, on the fouth coaft, who still maintain their independency. The natives of the country, who are established in the neighbourhood of Batavia, and for a tract of about 40 leagues along the mountains of the country of Bantam, are immediately fubject to the governor-general. The company fend droffards, or commissaries, among them, who administer justice and take care of the public re-

The city of Batavia is the capital not only of this a rampart 21 feet thick, covered on the outlide with environed by a ditch 45 yards over, and full of water, especially when the tides are high, in the spring. The avenues to the town are defended by feveral forts, each of which is well furnished with excellent brass without a passport. The river Jucatra passes through passage.

with trees that are ever green; over these canals are 56 bridges, befides those which lie without the town. The streets are all perfectly straight, and each, generally speaking, 30 feet broad. The houses are built of stone, after the manner of those in Holland. The city is about a league and a half in circumference, and has five gates ; but there are ten times the number of houses without that there are within it. There is a very fine town-house, four Calvinist churches, befides other places of worship for all forts of religions, a spin huys or house of correction, an orphan-house, a magazine of fea-flores, feveral for spices, with wharfs and cord-manufactures, and many other public buildings. The garrifon confilts commonly of between 2000 and 3000 men. Befides the forts mentioned above, there is the citadel of Batavia, a very fine regular fortification, fituated at the mouth of the river, and flanked with four baftions; two of which command the fea, and the other two the town. It is in this citadel that the governor general of the Indies has his palace; over-against which is that of the director general, who is the next person to the governor. The counfellors, and other principle officers of the company, have also their apartments there; as have likewife the physician, the furgeon, and the apothecary. There are in it, besides, arsenals and magazines furnished with ammunition for many years. The city of Batavia is not only inhabited by Dutch, French, Portuguese, and other Europeans, established here on account of trade; but also by a valt number of Indians of different nations, Javanese, Chinese, Malayans, Negroes, Amboynefe, Armenians, natives of the ifle of Bali, Mardykers or Topasses, Macassers, Timors, Bougis, &c. Of the Chinese, there are, it is faid, about 100,000 in the island; of which near 30,000 refided in the city till the year 1740, when the Dutch, pretending that they were in a plot against them, fent a body of troops into their quarter, and demanded their arms, which the Chinese readily delivered up; and the next day the governor fent another body, with orders to murder and maffacre every one of the Chinefe, men, women, and children. Some relate there were 20,000, others 30,000, that were put to death, without any manner of trial; and yet the barbarous governor, who was the inftrument of this cruel proceeding, had the affurance to embark for Europe. imagining he had amaffed wealth enough to fecure him against any profecution in Holland : but the Dutch, finding themselves detested and abhorred by island but of all the Dutch dominions in India. It all mankind for this piece of tyranny, endeavoured to is an exceeding fine city, fituated in the latitude of throw the odium of it upon the governor, though he 6° fouth, at the mouth of the river Jucatra, and in had the hands of all the council of Batavia, except one, the bosom of a large commodious bay, which may be to the order for the massacre. The states, therefore, confidered not only as one of the fafeft harbours in dispatched a packet to the Cape of Good Hope, con-India, but in the world. The city is furrounded by taining orders to apprehend the governor, and fend him back to Batavia to be tried. He was accordingflone and fortified with 22 bassions. This rampart is ly apprehended at the Cape; but has never been heard of fince. It is supposed he was thrown over board in his paffage to Batavia, that there might be no farther inquiries into the matter; and it is faid, all the wealth this merciful gentleman had amaffed, and fent over cannon: no person is suffered to go beyond these forts before him in four ships, was cast away in the

JAY (Guy Michael le), a French gentleman, who diffinguished himself by causing a polyglot bible to be printed at his own expence in to vols folio: but he ruined himfelf by that impression, first because he would not fuffer it to appear under the name of cardinal Richelieu, who, after the example of cardinal Ximenes, was ambitious of eternizing his name by this means; and next, because he made it too dear for the English market; on which Dr Walton undertook his polyglot bible, which, being more commodious, reduced the price of M. le Jay's. After the death of his wife, M. le Jay took orders, was made dean of Vezelay in the Nivernois, and Louis XIV. gave him the post of counsellor of state.

JAZER, or JASER (anc. geog.), a Levitical city in the territory of the Amorrhites beyond Jordan, 10 miles to the well, or rather fouth-well, of Philadelphia, and 15 miles from Efebon; and therefore fituated between Philadelphia and Heshbon, on the east border of the tribe of Gad, supposed to be the Jazorem of Iofephus. In Jeremiah xlviii, mention is made of the fea of Jazer, that is a lake; taken either for an effusion or overflowing of the Arnon, or a lake through which it passes, or from which it takes its rife.

Vol. IX. Part I.

IBERIA (SPAIN), fo called by the ancients from Theria

Iberia was also the name of an inland country of tns; to the north mount Caucafus; on the east Albania; and on the fouth Armenia Magna: Now the brother of Gomer and Magog. His opinion is confirmed by the Septuagint; for Meshech and Tubal are by these interpreters rendered Moschi and Iberians. We know little of the history of the country till the reign of Mithridates, when their king, named Artocis, fiding with that prince against Lucullus, and afterwards against Pompey, was defeated by the latter with great flaughter; but afterwards obtained a peace, upon delivering up his fons as hostages. Little notice is till that empire was overturned, when this, with the other countries in Afia bordering on it, fell fucceffive-JAWER, a city of Silefia, capital of a province of ly under the power of the Saracens and Turks.

IBERIS, SCIATICA CRESSES, or Candy-tuft: Agenus furrounded with piazzas. It is 12 miles fouth-eaft of of the filiquofa order, belonging to the tetrac namia Lismitz. 30 fouth-west of Bresau, and 87 east of class of plants; and in the natural method ram g under the 39th order, Siliquefa. The corolla is ire gular; the two exterior petals larger than the interior ones;

the filicula polyspermous, emarginated.

Species. 1. The umbellata, or common candy-tuft, hath herbaceous, fhort, round, and very branchy stalks of tufty growth, from about fix to eight or ten inches high; small spear-shaped leaves, the lower ones ferrated, the upper entire; and all the flalks and branches terminated by umbellate clusters of flowers of different colours in the varieties. 2. The amara, or bitter candy-tuft, hath stalks branching like the former, which rife from eight to ten or twelve inches high; fmall, fpear shaped, and slightly indented leaves; and all the branches terminated by racemofe bunches of white flowers in June and July. 3. The fempervirens, commonly called tree candy-tuft, hath low undershrubby stalks, very branchy and bushy, rifing to the height of 10 or 12 inches, with white flowers in umbels at the ends of the branches, appearing great part of the fummer. 4. The femperflorens, or ever-flowering shrubby iberis, hath low undershrubby stalks very branchy, growing to the height of 18 inches, with white flowers in umbels at the ends of the branches, appearing at all

times of the year.

Culture. The two first kinds, being hardy annuals, may be fowed in any common foil in the month of March, or from that time till midfummer, and will thus afford a fuccession of flowers from June to September, which are succeeded by great plenty of feeds. The other two are fomewhat tender; and therefore must be planted in pots, in order to be sheltered from the winter-froits. They are easily propagated by slips or cuttings.

IBEX, in zoology. See CAPRA.

IBIS, in ornithology. See TANTALUS. 1BYCUS, a Greek lyric poet, of whose works there are only a few fragments remaining, flourished 550 B. C. It is faid, that he was affaffinated by robbers; and that, when dying, he called upon fome

Ice. cranes he faw flying to bear witness. Some time after, one of the murderers feeing fome cranes, faid to his companions, "There are the witnesses of Ibycus's death:" which being reported to the magistrates, the affaffins were put to the torture, and having confessed the fact, were hanged. Thence arose the proverb Ibyci Grues.

body, formed of some fluid, particularly water, by

means of cold. See FROST.

The younger Lemery observes, that ice is only a re-establishment of the parts of water in their natural state; that the mere absence of fire is sufficient to account for this re-establishment; and that the fluidity of water is a real fusion, like that of metals exposed to the fire; differing only in this, that a greater quantity of fire is necessery to the one than the other. Gallileo was the first that observed ice to be lighter than the water which composed it: and hence it happens, that ice floats upon water, its specific gravity being to that of water as eight to nine. This rarefaction of ice feems to be owing to the air-bubbles produced in wamuchospecifically lighter: these air bubbles, during as to sart the containing veffels, though ever fo ftrong. See CONGELATION, COLD.

M. Mairan, in a differtation on ice, attributes the increase of its bulk chiefly to a different arrangement of the parts of the water from which it is formed; the icy skin on the water being composed of filaments which, according to him, are found to be constantly and regularly joined at an angle of 60°; and which, by this angular difposition, occupy a greater volume than if they were parallel. He found the augmentation of the volume of water by freezing, in different trials, a 14th, an 18th, a 19th, and when the water was previously purged of air, only a 22d part: that ice, even after its formation, continues to expand by cold : for, after water had been frozen to some thickness, the fluid part being let out by a hole in the bottom of the veffel, a continuance of the cold made the ice convex; and a piece of ice, which was at first only a 14th part specifically lighter than water, on being exposed some days to the frost, became a 12th part lighter. To this cause he attributes the bursting of ice on ponds.

Wax, refins, and animal fats, made fluid by fire, inflead of expanding like watery liquors, shrink in their return to folidity: for folid pieces of the fame bodies fink to the bottom of the respective fluids; a proof tic works. In the more temperate European climates that these bodies are more dense in their folid than in their fluid flate. The oils which congeal by cold, as oil-olive, and the effential oil of anifeeds, appear also to shrink in their congelation. Hence, the different dispositions of different kinds of trees to be burft by, or to refift, firong frosts, are by some attributed to the juices with which the tree abounds; being in the one case watery, and in the other resinous or oily.

Though it has been generally supposed that the na-

find a confiderable difference in the accounts of those who have undertaken to describe these crystals. M. Mairan informs us, that they are ftars with fix radii; and his opinion is confirmed by observing the figure of frost on glass. M. Rome de L'Isle determines the form of the folid crystal to be an equilateral octaedron. M. Hassenfratz found it to be a prismatic hexaedron; ICE, in physiology, a folid, transparent, and brittle but M. d'Antic found a method of reconciling these feemingly opposite opinions. In a violent hail-storm, where the hailstones were very large, he found they had sharp wedge-like angles of more than half an inch; and in these he supposed it impossible to see two pyramidal tetraedra joined laterally, and not to conclude that each grain was composed of octaedrons converging to a centre. Some had a cavity in the middle: and he faw the opposite extremities of two opposite pyramids, which constitute the octaedron; he likewife faw the octaedron entire united in the middle ; all of them were therefore fimilar to the cryftals formed upon a thread immerfed in a faline folution. On these principles M. Antic constructed an artificial octaedron refembling one of the largest hailstones; and ter by freezing; and which, being confiderably large found that the angle at the fummit of the pyramid in proportion to the water frozen, render the body fo was 45°, but that of the junction of the two pyramids 145°. It is not, however, eafy to procure reguthe oduction, acquire a great expansive power, fo lar crystals in hailstones where the operation is conducted with fuch rapidity; in fuow and hoar-froft. where the crystallization goes on more slowly, our author is of opinion that he fees the rudiments of octaedra.

Ice, as is explained under the article FROST, forms generally on the furface of water : but this too, like the crystallization, may be varied by an alteration in the circumstances. In Germany, particularly the northern parts of that country, it has been observed that there are three kinds of ice. I. That which forms on the furface. 2. Another kind formed in the middle of the water, refembling nuclei or fmall hail. 3. The ground ice which is produced at the bottom, especially where there is any fibrous fubftance to which it may adhere. This is full of cells like a wasp's nest, but less regular; and performs many strange effects in bringing up very heavy bodies from the bottom, by means of its inferiority in specific gravity to the water in which it is formed. The ice which forms in the middle of the water rifes to the top, and there unites into large maffes; but the formation both of this and the groundice takes place only in violent and fudden colds, where the water is shallow, and the surface disturbed in such a manner that the congelation cannot take place. The ground ice is very destructive to dykes and other aquathese kinds of ice are not met with.

In many countries the warmth of the climate renders ice not only a defirable, but even a necessary article; fo that it becomes an object of some confequence to fall upon a ready and cheap method of procuring it. Though the cheapeft method hitherto difcovered feems to be that related under the article Cold, by means of fal ammoniac or Glauber's falt, yet it may not be amifs to take notice of fome attempts tural crystals of ice are stars of fix rays, forming angles made by Mr Cavallo to discover a method of produof 60° with each other, yet this crystallization of wa- cing a sufficient degree of cold for this purpose by the ter, as it may properly be called, feems to be as much evaporation of volatile liquors. He found, however, affected by circumstances as that of falts. Hence we in the course of these experiments, that ether was in-

Plate

tee. comparably fuperior to any other fluid in the degree (fig. 1.), terminating in a capillary aperture, which is of cold it produced. The price of the liquor natu- to be fixed upon the bottle containing the ether. rally induced him to fall upon a method of using it with as little waite as possible. The thermometer he made use of had the ball quite detached from the ivory piece on which the fcale was engraved. The various fluids was then thrown upon the ball through the capillary aperture of a fmall glass vessel shaped like a funnel; and care was taken to throw them upon it fo under part, excepting when those fluids were used, fufficient barely to keep the ball moint, without any thermometer was kept very gently turning round its axis, that the fluid made use of might fall upon every part of its ball. He found this method preferable to that of dipping the ball of the thermometer into the fluid and taking it out again immediately, or even of anointing it constantly with a feather. The evaporation, and confequently the cold, produced by it, may be increased by blowing on the thermometer with a pair of bellows; though this was not used in the experiments now to be related, on account of the difficulty of its being performed by one perfon, and likewife because it occasions much uncertainty in the re-

The room in which the experiments were made was heated to 64° of Fahrenheit; and with water it was reduced to 560, viz. 80 below that of the 190m or of the water employed. The eff ct took place in about two minutes; but though the operation was continued for a longer time, it did not link lower. With spirit of wine it funk to 48. The cold was greater with highly rectified spirit than with the weaker fort; but the difference is less than would be expected by one who had never feen the experiment made. The pure spirit produces its effect much more quickly. On using various other fluids which were either compound ed of water and spirituous liquors or pure effences, he found that the cold produced by their evaporation was generally fome intermediate degree between that produced by water and the spirit of wine. Oil of turpentine funk the mercury three degrees; but olive oil and others, which evaporate very flowly, or not at all, did not fenfibly affect the thermometer.

To observe how much the evaporation of spirit of wine, and confequently the cold produced by it, would be increased by electricity, he put the tube containing it into an infulating handle, and connected it with the conductor of an electrical machine, which was kept in action during the time of making the experiment; by which means one degree of cold feemed to be gained, as the mercury now funk to 47° initead of 48°, at which it had flood formerly. On trying the three mineral acids, he found that they heated the thermometer intead of cooling it; which effect he attributes to the heat they themselves acquired by uniting with the moisture of the atmosphere. The vitriolic acid, which was very strong and transparent, raised the mercury to 102°, the fmoking nitrous acid to 72°, and the marine to 60%.

Round the lower part of the neck at A fome thread is wound, in order to let it fit the neck of the bottle. When the experiment is to be made, the stopper of the bottle containing the ether is to be removed, and the tube just mentioned put in its room. The thread round the tube ought also to be previously moistened with water or spittle before it is put into the neck of flowly, that a drop might now and then fall from the bottle, in order the more effectually to prevent the escape of the ether betwixt the neck of the vial and which evaporate very flowly; in which case it was tube. Holding then the bottle by its bottom FG (fig. 2), and keeping it inclined as in the figure, the drop falling from it. During the experiment the fmell fream of ether iffuing out of the aperture D of the tube DE, is directed upon the ball of the thermometer, or upon a tube containing water or other liquor that is required to be congealed. As ether is very volatile, and has the remarkable property of increating the bulk of av, there is no aperture requifite to allow the air to enter the bottle while the liquid flows out. The heat of the hand is more than fufficient to force out the ether in a continued ftream at the aperture D.

In this manner, throwing the stream of ether upon the ball of a thermometer in fuch a quantity that a drop might now and then, every to feconds for instance, fall from the bulb of the thermometer, Mr Cavallo brought the mercury down to 30, or 290 below the freezing point, when the atmosphere was fomewhat hotter than temperate. When the ether is very good, i.e. capable of diffolving elattic gum, and has a fmall bulb, not above 20 drops of it are required to produce this effect, and about two minutes of time; but the common fort must be used in greater quantity, and for a longer time; though at last the theimometer is brought down by this very nearly as low as by the best fort.

To freeze water by the evaporation of ether, Mr Cavallo takes a thin glass tube about four inches long. and one-fifth of an inch diameter, hermetically fealed at one end, with a little water in it, fo as to take up about half an inch of the cavity, as is shown at CB in fig. 3. Into this tube a flender wire H is also introduced, the lower extremity of which is twifted into a ipiral, and ferves to draw up the bit of ice when formed. He then holds the glass tube by its upper part A with the fingers of the left hand, and keeps it continually and gently turning round its axis, first one way and then the other; whilst with the right hand he holds the phial containing the ether in fuch a manner as to direct the fiream on the outfide of the tube. and a little above the furrace of the water contained in it. The capillary aperture I) should be kept almost in contact with the furface of the tube containing the water; and by continuing the operation for two or three minutes, the water will be frozen as it were in an instant; and the opacity will ascend to C in less than half a fecond of time which makes a beautiful appearance. This congelation, however, is only fuperficial; and in order to congeal the whole quantity of water, the operation must be continued a minute or two longer; after which the wire H will be found The apparatus for using the least possible quantity kept very tight by the ice. The hand must then be of ether for freezing water confifts in a glats tube applied to the outfide of the tube, in order to fuften the furface of the ice; which would otherwise adhere very firmly to the glass; but when this is done, the wire Heafily brings it out.

Sometimes our author was accustomed to put into the tube a small thermometer instead of the wire H; and thus he had an opportunity of observing a very curious phenomenon unnoticed by others, viz. that in the winter time water requires a smaller degree of cold to congeal it than in the fummer. In the winter, for instance, the water in the tube AB will freeze when the thermometer flands about 20°; but in the fummer, or even when the thermometer stands at 60°, the quickfilver must be brought down 10, 15, or even more degrees below the freezing point before any congelation can take place. In the fummer time therefore a greater quantity of ether, and more time, will be required to congeal any given quantity of water than in winter. When the temperature of the atmosphere has been about 40°, our author has been able to congeal a quantity of water with an equal quantity of good ether: but in fummer two or three times the quantity are required to perform the effect, " There feems (favs he) to be fomething in the air, which, besides heat, interferes with the freezing of water, and perhaps of all fluids; though I cannot fay from my own experience whether the above mentioned difference between the freezing in winter and fummer takes place with other fluids, as milk, oils, wines," &c.

The proportion of ether requifite to congeal water feems to vary with the quantity of the latter; that is, a large quantity of water feems to require a proportionably less quantity of ether to freeze it than a fmaller one. " In the beginning of the fpring (favs Mr Cavallo), I froze a quarter of an ounce of water with about half an ounce of ether; the apparatus being larger, though fimilar to that described above. Now as the price of ether, fufficiently good for the purpose, is generally about 18d. or 2s. per ounce, it is plain, that with an expence under two shillings, a quarter of an ounce of ice, or ice cream, may be made, in every climate, and at any time, which may afford great fatisfaction to those persons, who, living in those places where no natural ice is to be had, never faw or talted any fuch delicious refreshment. When a small piece of ice, for inflance, of about ten grains weight, is required, the necessary apparatus is very small, and the expence not worth mentioning. I have a small box four inches and a half long, two inches broad, and one and a half deep, containing all the apparatus neceffary for this purpole; viz. a bottle capable of containing about one ounce of ether; two pointed tubes, in case one should break; a tube in which the water is to be frozen, and a wire. With the quantity of ether contained in this small and very portable apparatus, the experiment may be repeated about ten times. A person who wishes to perform such experiments in hot climates, and in places where ice is not eafily procured, requires only a larger bottle of ether befides the whole apparatus described above." Electricity increases the cold produced by means of evaporating ether but very little, though the effect is perceptible. Having thrown the electrified and also the unelectrified stream of ether upon the bulb of a thermometer. the mercury was brought down two degrees lower in the former than in the latter cafe.

Our author observes, for the sake of those who may be initiated to repeat this experiment, that a cork confines this volatile fluid much better than a glass stopple, which it is almost impossible to grind with such exactness as to prevent entirely the evaporation of the ether. When a stopple, made very nicely out of an uniform and close piece of cork, which goes rather tight, is put upon a bottle of ether, the sincl of that shud cannot be perceived through it; but he never saw a glass stopple which could produce that effect. In this manner, ether, spirit of wine, or any other volatile shud, may be preferved, which does not corrode cork by its sums. When the stopple, however, is very often taken out, it becomes loofe, as it will also do by long keeping; in either of which case it must be changed.

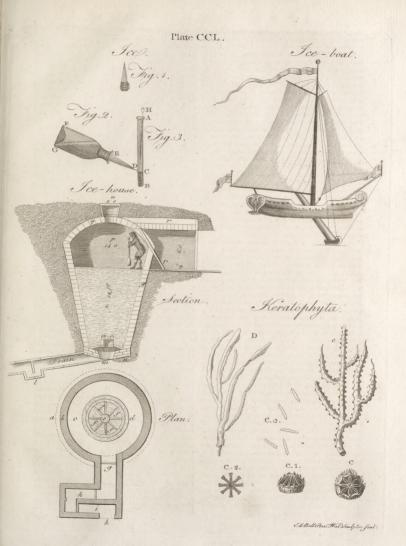

Blink of the Ics, is a name given by the pilots to a bright appearance near the horizon occasioned by the ice, and observed before the ice itself is seen.

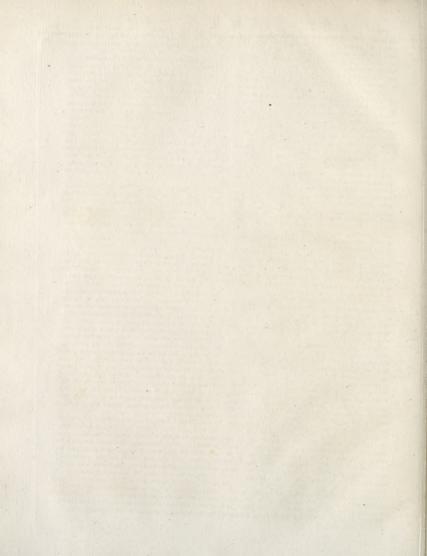

ICE-Boats, boats fo constructed as to fail upon ice. and which are very common in Holland, particularly upon the river Maese and the lake Y. See Plate CCL. They go with incredible swiftness, fometimes so quick as to affect the breath, and are found very ufeful in conveying goods and paffengers over lakes and great rivers in that country. Boats of different fizes are placed in a transverse form upon a 2 tor 3 inch deal board; at the extremity of each end are fixed irons, which turn up in the form of skaits; upon this plank the boat refts, and the two ends feem as out riggers to prevent overfetting; whence ropes are fastened that lead to the head of the maft in the nature of shrowds, and otherspaffed through a block across the bowsprit: the rudder is made somewhat like a hatchet with the head placed downward, which being preffed down, cuts the ice, and ferves all the purposes of a rudder in the water, by enabling the helmfman to fleer, tack, &c.

Method of making Ics-Cream. Take a sufficient quantity of cream, and, when it is to be mixed with raspberry, or currant, or pine, a quarter part as muchof the juice or jam as of the cream: after beating and straining the mixture through a cloth, put it with a little juice of lemon into the mould, which is a pewter veffel, and varying in fize and shape at pleasure; cover the mould and place it in a pail about two-thirds full of ice, into which two handfuls of falt have been thrown ; turn the mould by the hand-hold with a quick motion. to and fro, in the manner used for milling chocolate, for eight or ten minutes; then let it rest as long, and turn it again for the fame time; and having left it to stand half an hour, it is fit to be turned out of the mould and to be fent to table. Lemon juice and fugar, and the juices of various kinds of fruits, are frozen without cream; and when cream is used, it should be well. mixed.

Ics. Hill, a fort of fructure or contrivance commonupon the river Neva ar Peterfourgh, and which afford a perpetual fund of amufement to the populace. They are conflucted in the following manner. A feafibidingis raifed upon the river about 30 feet in height, with a landing place on the top, the afcent to which is by a ladder. From this fummit a floping plain of boards, about four yards broad and 30 long, defended to the fuperficies of the river: it is fupported by fitnong poles gradually decreasing in height, and its fides are defended by a parapet of planks. Upon thefe boards are

h

Re. laid funare maffes of ice about four inches thick, which being first smoothed with the axe and laid close to each other, are then fprinkled with water : by these means they coalefce, and, adhering to the boards, immediately form an inclined plain of pure ice. From the bottom of this plain the fnow is cleared away for the length of 200 yards and the breadth of four, upon the level bed of the river; and the fides of this course, as well as the fides and top of the feaffolding, are ornamented with firs and pines. Each person, being provided with a fledge, mounts the ladder; and having attained the funmit, he fets himfelf upon his fledge at the upper extremity of the inclined plain, down which he fuffers it to glide with confiderable rapidity, poining it as he goes down; when the velocity acquired by the defeent carries it above 100 yards upon the level ice of the river. At the end of this courfe, there is ufually a fimilar ice-hill, nearly parallel to the former, which begins where the other ends; fo that the perfon immediately mounts again, and in the fame manner glides down the other inclined plain of ice. This diversion he re-peats as often as he pleases. The boys also are continually employed in fkaiting down thefe hills: they glide chiefly upon one skait, as they are able to poife themselves better upon one leg than upon two. These ice-hills exhibit a pleafing appearance upon the river, as well from the trees with which they are ornamented. as from the moving objects which at particular times of the day are descending without intermission.

Ica. House, a repository for ice during the summer months. The aspect of ice houses should be towards the east or fouth-east, for the advantage of the morning fun to expel the damp air, as that is more perpicious than warmth; for which reason trees in the vicinity of

an ice house tend to its disadvantage.

The best foil for an ice-house to be made in is chalk, as it conveys away the wafte water without any artificial drain; next to that, loofe flony earth or gravelly foil. Its fituation should be on the fide of a hill, for the advantage of entering the cell upon a level, as in the drawing, Plate CCL.

To construct an ice house, first choose a proper place at a convenient distance from the dwelling-house or houses it is to serve : dig a cavity (if for one samily, of the dimensions specified in the design) of the figure of an inverted cone, finking the bottom, concave, to form a refervoir for the watte water till it can drain off ; if the foil requires it, cut a drain to a confiderable distance, or so far as will come out at the fide of the hill, or into a well, to make it communicate with the fprings, and in that drain form a flink or air-trap, marked !, by finking the drain fo much lower in that place as it is high, and bring a partition from the top an inch or more into the water, which will confequently be in the trap ; and will keep the well air-tight. Work up a sufficient number of brick piers to receive a cartwheel, to be laid with its convex fide upwards to receive the ice; lay hurdles and ftraw upon the wheel, which will let the melted ice drain through, and ferve as a floor. The fides and dome of the cone are to be nine inches thick-the fides to be done in fleened brickwork, i. e. without mortar, and wrought at right angles to the face of the work : the filling in behind should be with gravel, loofe stones, or brick-bats, that the water which drains through the fides may the more

eafily escape into the well. The doors of the icehouse should be made as close as possible, and bundles of straw placed always before the inner door to keep out the air.

Description of the parts referred to by the letters. a The line first dug out. b The brick circumference of the cell. c The diminution of the cell downwards. d The leffer diameter of the cell. e The cart wheel or joists and hurdles. f The piers to receive the wheel or floor. g The principal receptacle for straw. b The inner passage, i the first entrance, & the outer door, passages having a separate door each. I An air trapm The well. n The profile of the piers. o The ice filled in. p The height of the cone. q The dome worked in two half brick arches. r The arched paffage. s The door-ways inferted in the walls. s The floor of the passage. u An aperture through which the ice may be put into the cell; this must be covered next the crown of the dome, and then filled in with earths x The floping door, against which the straw should be

The ice when to be put in should be collected during the frost, broken into fmall pieces, and rammed down hard in strata of not more than a foot, in order to make it one complete body; the care in putting it in, and well ramming it, tends much to its prefervation. In a feafon when ice is not to be had in fufficient quantities fnow may be substituted.

Ice may be preserved in a dry place under ground. by covering it well with chaff, ftraw, or reeds,

Great use is made of chast in some places of Italy to preferve ice: the ice-house for this purpose need only be a deep hole dug in the ground on the fide of a hill, from the bottom of which they can eafily carry out a drain, to let out the water which is separated at any time from the ice, that it may not melt and spoil the rest. If the ground is tolerably dry, they do not line the fides with any thing, but leave them naked, and only make a covering of thatch over the top of the hole :this pit they fill either with pure fnow, or elfe with ice taken from the purest and clearest water; because they do not use it as we do in England, to set the bottles in, but really mix it with the wine. They first cover the bottom of the hole with chaff, and then lay in the ice, not letting it any where touch the fides, but ramming in a large bed of chaff all the way between : theythus carry on the filling to the top, and then cover the furface with chaff; and in this manner it will keep as long as they please. When they take any of it out for use, they wrap the lump up in chaff, and it may then be carried to any distant place without waste or running.

Ice-Island, a name given by failors to a great quantity of ice collected into one huge folid mass, and floating about upon the feas near or within the Polar circles. -Many of these fluctuating islands are met with on the coasts of Spitzbergen, to the great danger of the shipping employed in the Greenland fishery. In the midit of those tremendous masses navigators have been arrested and frozen to death. In this manner the brave Sir Hugh Willoughby perished with all his crew in 1553; and in the year 1773, Lord Mulgrave, after every effort which the most finished feaman could make to accomplish the end of his voyage, was caught in the ice, . and was near experiencing the fame unhappy fate. See:

Tee. the account at large in Phippi's Voyage to the North are continually increased in height by the freezing of Pole. As there described, the scene, divested of the the spray of the sea, or of the melting of the snow, horror from the eventful expectation of change, was the most beautiful and picturefoue :- I'wo large ships becalmed in a vast bason, surrounded on all sides by islands of various forms: the weather clear: the fun gilding the circumambient ice, which was low, fmooth, and even; covered with fnow, excepting where the pools of water on part of the furface appeared cryftalline with the young ice; the small space of sea they were confined in perfectly smooth. After fruitless attempts to force a way through the fields of ice, their limits were perpetually contracted by its clofing; till at length it befet each veffel till they became immoveably fixed. The smooth extent of surface was foon lost : the pressure of the pieces of ice, by the violence of the fwell, caused them to pack ; fragment rose upon fragment, till they were in many places higher than the main-yard. The movements of the ships were tremendous and involuntary, in conjunction with the furrounding ice, actuated by the currents. The water shoaled to 14 fathoms. The grounding of the ice or of the ships would have been equally fatal: The force of the ice might have crushed them to atoms, or have lifted them out of the water and overfet them, or have left them suspended on the summits of the pieces of ice at a tremendous height, exposed to the fury of the winds, or to the risk of being dashed to pieces by the failure of their frozen dock. An attempt was made to cut a paffage through the ice; after a perfeverance worthy of Britons, it proved fruitless. The commander, at all times mafter of himfelf, directed the boats to be made ready to be hauled over the ice, till they arrived at navigable water (a talk alone of feven days), and in them to make their voyage to England. The boats were drawn progressively three whole days. At length a wind fprung up, the ice separated sufficiently to yield to the preffure of the full-failed ships, which, after labouring against the resisting helds of ice, arrived on the 10th of August in the harbour of Smeeringberg, at the west end of Spitzbergen, between it and Hack-

The forms affumed by the ice in this chilling climate are extremely pleating to even the most incurious eye. The furface of that which is congealed from the fea water (for we must allow it two origins) is flat and even, hard, opake, refembling white fugar, and incapable of being flid on, like the British ice The greater pieces, or fields, are many leagues in length : the leffer are the meadows of the feals, on which those animals at times frolic by hundreds. The motion of the leffer pieces is as rapid as the currents; the greater. which are formetimes 200 leagues long, and 60 or 80 broad, move flow and majeffically; often fix for a time, immoveable by the power of the ocean, and then produce near the her zon that bright white appearance called the blink. The approximation of two great fields produces a most fingular phenomenon; it forces the leffer (if the term can be applied to pieces of feveral acres fquare) out of the water, and adds them to their furface : a second an often a third succeeds ; so that the whole forms an aggregate of a tremendous height. Thefe float in the fea like fo many rugged mountains, and are fometimes 500 or 600 yards thick; but the far greater part is concealed beneath the water. These

which falls on them. Those which remain in this frozen climate receive continual growth; others are gradually wafted by the northern winds into fouthern latitudes, and melt by degrees, by the heat of the funtill they wafte away, or disappear in the boundless

The collision of the great fields of ice, in high latie tudes, is often attended with a noise that for a time takes away the fenfe of hearing anything elfe; and the leffer with a grinding of unspeakable horror. The water which dashes against the mountainous ice freezes into an infinite variety of forms; and gives the voyager ideal towns, freets, churches, fleeples, and every shape which imagination can frame.

ICE-Plant. See MESEMBRYANTHEMUM.

ICEBERGS, are large bodies of ice filling the valleys between the high mountains in northern latitudes. Among the most remarkable are those of the east coast of Spitzbergen ; (fee GREENLAND, no 10.) They are feven in number, but at confiderable diffances from each other; each fills the valleys for tracts unknown, in a region totally inacceffible in the internal parts. The glaciers * of Switzerland feem contemptible to . See Glas thefe; but prefent often a fimilar front into fome lower ciers. valley. The last exhibits over the sea a front 300 feet high, emulating the emerald in colour: cataracts of melted fnow precipitate down various parts, and black foiring mountains, streaked with white, bound the fides, and rife crag above crag, as far as eye can reach in the back ground. See Plate CCLI. At times immenfe fragments break off, and tumble into the water. with a most alarming dashing. A piece of this vivid green substance has fallen, and grounded in 24 fathoms water, and spired above the surface 50 feet +. Simi- + "bippe" lar icebergs are frequent in all the Arctic regions; and Voyage, to their lapfes is owing the folid mountainous ice which P. 70. infelts those seas .- Froit sports wond rfully with these icebergs, and gives them majestic as well as other most fingular forms. Maffes have been feen affuming the shape of a Gothic church, with arched windows and doors, and all the rich drapery of that flyle, composed of what an Arabian tale would fearcely dare to relate, of crystal of the richest sapphirme blue: tables with one or more feet; and often immense flat-roofed temples, like those of Luxxor on the Nile, supported by round transparent columns of corulean hue, float by the aftonished spectator .- These icebergs are the creation of ages, and receive annually additional height by the falling of fnows and of rain, which often instantly freezes, and more than repairs the loss occasioned by the influence of the melting fun.

ICELAND, a large island lying in the northern part of the Atlantic Ocean, between 63 and 68 degrees of north latitude, and between 10 and 26 degrees of west longitude, its greatest length being about 700 miles, and its breadth 300.

This country lying partly within the frigid zone, and General asbeing liable to be furrounded with vall quantities of ice count of which come from the polar feas, is on account of the the counco'dness of its climate very inhospitable; but much try. more fo for other reasons. It is exceedingly subject to earthquakes; and fo full of volcanoes, that the little part of it which appears fit for the habitation of man

mate.

Iceland. feems almost totally laid waste by them. The best account that hath yet appeared of the island of Iceland is in a late publication intitled, " Letters on Iceland, &c. written by Uno Von Troil, D. D. first chaplain to his Swedish majesty." This gentleman failed from London on the 12th of July 1772, in company with Mr Banks, Dr Solander, and Dr James Lind of Edinburgh, in a ship for which L. 100 Sterling was paid every month. After visiting the western isles of Scotland, they arrived on the 28th of August at Iceland, where they cast anchor at Besseltedr or Bessaltadr, lying in about 64° 6' N. Lat. in the western part of the island. The country had to them the most dismal appearance that can be conceived. "Imagine to yourfelf (favs Dr Troil) a country, which from one end to the other prefents to your view only barren mountains, whose fummits are covered with eternal snow, and between them fields divided by vitrified cliffs, whose high and sharp points feem to vie with each other to deprive you of the fight of a little grass which scantily fprings up among them. These same dreary rocks likewise conceal the few scattered habitations of the natives, and no where a fingle tree appears which might afford shelter to friendship and innocence. The prospect before us, though not pleasing, was uncommon and furprifing. Whatever prefented itself to our view bore the marks of devastation; and our eyes, accustomed to behold the pleafing coafts of England, no faw nothing but the veftiges of the operation of a fire, Heaven knows how ancient

The climate of Iceland, however, is not unwholeof the clifome or naturally subject to excessive colds, notwithflanding its northwardly fituation. There have been inflances indeed of Fahrenheit's thermometer finking to 24° below the freezing point in winter, and rifing to 104° in fummer. Since the year 1749, observations have been made on the weather; and the result of these observations bath been unfavourable, as the coldness of the climate is thought to be on the increase, and of confequence the country is in danger of becoming unfit for the habitation of the human race. Wood, which formerly grew in great quantities all over the island, cannot now be raifed. Even the hardy firs of Norway cannot be reared in this island. They seemed indeed to thrive till they were about two feet high; but then their tops withered, and they ceafed to grow. This is owing chiefly to the ftorms and hurricanes which frequently happen in the months of May and June, and which are very unfavourable to vegetation of every kind. In 1772, governor Thodal fowed a little barley, which grew very brifkly; but a fhort time before it was to be reaped, a violent ftorm fo effectually deftroyed it, that only a few grains were found scattered about. Besides these violent winds, this island lies under another disadvantage, owing to the floating ice already mentioned, with which the coasts are often befet. This ice comes on by degrees, always with an eafterly wind, and frequently in fuch quantities as to fill up all the gulphs on the north-west side of the island, and even covers the fea as far as the eye can reach; it also fometimes drives to other shores. It generally comes in January, and goes away in March. Sometimes it only reaches the land in April; and, remaining there for a long time, does an incredible deal of mischief. It con-

tatuoms in height; and partly of field-ice, which is Iceland. neither fo thick nor fo much dreaded. Sometimes these enormous masses are grounded in shoal-water; and in these cases they remain for many months, nay years, undiffolved, chilling the atmosphere for a great way round. When many fuch bulky and lofty ice-maffes are floating together, the wood which is often found drifting between them, is fo much chafed, and preffed with fuch violence together, that it fometimes takes fire: which circumstance has occasioned fabulous accounts of the ice being in flames.

In 1753 and 1754, this ice occasioned such a violent cold, that horses and sheep dropped down dead by reason of it, as well as for want of food; horses were observed to feed upon dead cartle, and the sheep eat of each other's wool. In 1755, towards the end of the month of May, the waters were frozen over in one night to the thickness of an inch and five lines. In 1756, on the 26th of June, fnow fell to the depth of a yard, and continued falling through the months of July and August. In the year following it froze very hard towards the end of May and beginning of June, in the fouth part of the illand, which occasioned a great fearcity of grafs. These frosts are generally followed by a famine, many examples of which are to be found in the Icelandic chronicles. Befides these calamities, a number of bears annually arrive with the ice, which commit great ravages among the sheep. The Icelanders attempt to deftroy these intruders as soon as they get fight of them. Sometimes they affemble together, and drive them back to the ice, with which they often float off again. For want of fire-arms, they are obliged to use spears on these occasions. The government also encourage the destruction of these animals. by paying a premium of 10 dollars for every bear that is killed, and purchasing the skin of him who killed it.

Notwithstanding this difmal picture, however, taken from Von Troil's letters, some tracts of ground, in high cultivation, are mentioned as being covered by the great eruption of lava in 1783. It is possible, therefore, that the above may have been fomewhat exaggerated.

Thunder and lightning are feldom heard in Iceland, except in the neighbourhood of volcanoes. Aurora Borealis is very frequent and ftrong. It most commonly appears in dry weather; though there are not wanting inflances of its being feen before or after rain, or even during the time of it. The lunar halo, which prognosticates bad weather, is likewise very frequent here; as are also parhelions, which appear from one to nine in number at a time. These parhelions are obferved chiefly at the approach of the Greenland ice. when an intense degree of frost is produced, and the frozen vapours fill the air. Fire-balls, fometimes round and fometimes oval, are observed, and a kind of ignis fatuus which attaches itself to men and beafts; and comets are also frequently mentioned in their chronicles. This last circumstance deserves the attention of aftronomers.

Iceland, befides all the inconveniencies already mentioned, has two very terrible ones, called by the natives /krida and /nioflodi : the name of the first importslarge pieces of a mountain tumbling down and deftroying the lands and houses which lie at the foot of it; fifts partly of mountains of ice, faid to be fometimes 60 this happened in 1554, when a whole farm was ruined,

decland and 13 people buried alive. The other word fignifies whatever nature has of beautiful and terrible, united Iceland. the effects of a prod gious quantity of flow, which covers the tops of the mountains, rolling down in immenfe maffes, and doing a great deal of damage : of this there was an inflance in 1600, during the night, when two farms were buried, with all their inhabitants and cattle. This last accident Iceland has in common with all very mountainous countries, particularly Switzerland.

Account of the hot fprings of Iceland from Von

Plate

" Iceland abounds with hot and boiling fprings, fome of which spout up into the air to a surprising height. All the jets d'eau which have been contrived with fo much art, and at fuch an enormous expence, cannot Troil's Let. by any means be compared with these wonders of nature in Iceland. The water-works at Herenhausen throw up a fingle column of water of half a quarter of a vard in circumference to a height of about 70 feet; those at the Winterkasten at Cassel throw it up, but in a much thinner column, 450 feet; and the jet d'eau at St Cloud, which is thought the greatest of all the French water-works, cafts up a thin column 80 feet into the air: but fome fprings in Iceland pour forth columns of water feveral feet in thickness to the height of many fathoms; and many affirm of feveral hundred feet.

> "Thefe fprings are unequal in their degrees of heat; but we have observed none under 188 degrees of Fahrenheit's thermometer; in fome it is 192, 193, 212, and in one fmall vein of water 213 degrees. From fome the water flows gently, and the fpring is then called lang, "a bath;" from others it fpouts with a great noise, and is then called Huer, or kittel. It is very common for fome of these spouting springs to close up, and others to appear in their stead. All these hot waters have an incrusting quality; so that we very commonly find the exterior furface from whence it burfls forth covered with a kind of rind, which almost resembles chased work, and which we at first took for lime, but which was afterwards found by Mr Bergman to be of a filiceous or flinty nature. In some places the water taftes of fulphur, in others not; but when drank as foon as it is cold, taftes like common boiled water. The inhabitants use it at particular times for dyeing; and were they to adopt proper regulations, it might be of flill greater use. Victuals may also be boiled in it, and milk held over its steam becomes fweet; owing, most probably, to the excessive heat of the water, as the same effect is produced by boiling it a long time over the fire. They have begun to make falt by boiling fea-water over it, which when it is refined, is very pure and good. The cows which drink this hot water yield a great deal of milk. Egbert Olafsen relates, that the water does not become turbid when alkali is thrown into it, nor does it change the colour of fyrup of violets. Horrebow afferts, that if you fill a bottle at one of the spouting springs, the water will boil over two or three times while the fpring throws forth its water; and if corked too foon, the bottle will burft.

Darricu tion of one named Geyfers

" Among the many hot springs to be met with in har descrip- Iceland, several bear the name of geyfer . the following is a description of the most remarkable of that name, and in the whole island. It is about two days journey from Hecla, near a farm called Haukadul. Here a poet would have an opportunity of painting Nº 163.

in one picture, by delineating this furprifing phenomenon. Reprefent to yourfelf a large field, where you fee on one fide, at a great distance, high mountains covered with ice, whose summits are generally wrapped in clouds, fo that their tharp and unequal points become invilible. This lofs, however, is compenfated by a certain wind, which causes the clouds to fink, and cover the mountain itself when its fummit appears as it were to reft on the clouds. On the other fide Hecla is feen, with its three points covered with ice, rifing above the clouds, and, with the fmoke which ascends from it, forming other clouds at some distance from the real ones; and on another fide is a ridge of high rocks, at the foot of which boiling water from time to time iffues forth; and further on extends a marsh of about three English miles in circumference. where are 40 or 50 boiling springs, from which a vapour ascends to a prodigious height. - In the midst of these is the greatest fpring geyfer, which deferves a more exact and particular account. In travelling to the place about an English mile and an half from the bver, from which the ridge of rocks still divided us, we heard a loud roaring noise, like the rushing of a torrent precipitating itself from stapendous rocks. We asked our guide what it meant; he answered, it was geyfer roaring; and we foon faw with our naked eyes what before seemed almost incredible.

" The depth of the opening or pipe from which the water gustes cannot well be determined; for sometimes the water funk down feveral fathoms, and fome feconds paffed before a flone which was thrown into the aperture reached the furface of the water. The opening itself was perfectly round, and 19 feet in diameter, and terminated in a bason 59 feet in diameter. Both the pipe and the bason were covered with a rough stalactic rind, which had been formed by the force of the water: the outermost border of the bason is nine feet and an inch higher than the pipe itself. The water here spouted several times a-day, but always by starts, and after certain intervals. The people who lived in the neighbourhood told us, that they rofe higher in cold and bad weather than at other times : and Egbert Olafsen and feweral others affirm, that it has spouted to the height of 60 fathoms. Most probably they gueffed only by the eye, and on that account their calculation may be a little extravagant; and indeed it is to be doubted whether the water was ever thrown up fo high, though probably it fometimes mounts higher than when we observed it. The method we took to observe the height was as follows. Every one in company wrote down, at each time that the water fpouted, how high it appeared to him to be thrown, and we afterwards chofe the medium. The first column marks the spoutings of the water, in the order in which they followed one another; the fecond, the time when these effusions happened; the third, the height to which the water rofe; and the lait, how long each spouting of water continued.

N° Time	Height	Duration
1 At VI 42 m.	30 feet	o 20 feconds
251	6	0 20
3VII 16	6	0 10
431 .	12	,0 15
	6-	

Time Height Duration 6-VIII. 17 24 0 40 12 0 40

The pipe was now for the first time full of water, which ran flowly into the bafon.

9---IX. 25 10----X. 16 24

" At 35 minutes after twelve we heard as it were three discharges of a gun under ground, which made it shake: the water flowed over immediately, but inflantly funk again. At eight minutes after two, the water flowed over the border of the bason. At 15 minutes after three, we again heard feveral fubterranean noises, though not so strong as before. At 43 minutes after four, the water flowed over very flrongly during the space of a minute. In fix minutes after, we heard many loud fubterraneous discharges, not only near the fpring, but also from the neighbouring ridge of rocks where the water spouted. At 51 minutes after fix, the fountain spouted up to the height of 92 feet, and continued to do fo for four minutes. After this great effort, it funk down very low into the pipe, and was entirely quiet during feveral minutes; but foon began to bubble again: it was not, however, thrown up into the air, but only to the top of

"The force of the vapours which throw up thefe waters is excessive; it not only prevents the stones which are thrown into the opening from finking, but even throws them up to a very great height, together with the water. When the bason was full, we placed ourselves before the fun in such a manner that we could fee our shadows in the water; when every one observed round the shadow of his own head (though not round that of the heads of others,) a circle of almost the same colours which compose the rainbow, and round this another bright circle. This most prebably proceeded from the vapours exhaling from the

" Not far from this place, another fpring at the foot of the neighbouring ridge of rocks spouted water to the height of one or two yards each time. The opening through which this water iffued was not fo wide as the other: we imagined it possible to stop up the hole entirely by throwing large flones into it, and even flattered ourselves that our attempts had succeeded: but, to our aftonishment, the water gushed forth in a very violent manner. We haltened to the pipe, and found all the stones thrown aside, and the water playing freely through its former channel. In these large springs the waters were hot in the highest degree, and tafted a little of fulphur; but in other respects it was pure and clear. In the smaller fprings of the neighbourhood the water was tainted: in fome, it was as muddy as that of a clay-pit; in others, as white as milk; and in fome few, as red as

Account of " Iceland abounds with pillars of bafaltes, which the bafaltic the lower fort of people imagine have been piled upon pillars, &c. each other by the giants, who made use of superna-tural force to effect it. They have generally from three to feven fides; and are from four to fix feet in difmiffed the fecond, which returned to the ship again, thickness, and from 12 to 16 yards in length, without as he could find no land. The last trial proved more any horizontal divisions. But sometimes they are only successful; the third raven took his slight to Iceland, Vol. IX. Part. I.

from fix inches to one foot in height, and they are Iceland. then very regular, infomuch that they are fometimes made use of for windows and door-posts. In some places they only peep out here and there among the lava, or more frequently among the tufa: in other places they are quite overthrown, and pieces of broken pillars only make their appearance. Sometimes they extend without interruption for two or three miles in length. In one mountain they have a fingular appearance: on the top the pillars lie horizontally, in the middle they are floping; the lowest are perfectly perpendicular; and in fome parts they are bent into a femicircular figure. The matter of the Iceland bafaltes feems to be the fame with that of STAFFA; though in fome it is more porous, and inclines to a grey. Some we observed which were of a blackish grey, and composed of several joints. Another time we observed a kind of porous glaffy stone, confequently a lava, which was fo indiffinctly divided, that we were for fome time at a loss to determine whether it was basaltes or notthough at last we all agreed that it was."

Iron ore is found in fome parts of the island, and that beautiful copper ore called Malachites. Horrehow speaks of native filver. A stratum of sulphur is found near: Myvatu from nine inches to two feet in thickness: partly of a brown colour, and partly of a deep orange. Immediately over the fulphur is a blue earth; above that a vitriolic and aluminous one; and beneath the ful-

phur a reddish bole.

At what time the island of Iceland was first peopled History of is uncertain. An English colony indeed is faid to the island, have been fettled there in the beginning of the fifth century; but of this there are not fufficient proofs. There is, however, reason to suppose that the English and Irish were acquainted with this country under another name, long before the arrival of the Norwegians; for the celebrated Bede gives a pretty accurate description of the island. But of these original inhabitants we cannot pretend to fay any thing, as the Iceland chronicles go no farther back than the arrival of the Norwegians. What they relate is to the following

Naddodr, a famous pirate, was driven on the coaft of Iceland in 861, and named the country Snio-land. " Snow-land," on account of the great quantities of fuow with which he perceived the mountains covered. He did not remain there long; but on his return extolled the country to fuch a degree, that one Garder Suafarfon, an enterprifing Swede, was encouraged by his account to go in fearch of it in 864. He failed quite round the island, and gave it the name of Gardalsholmur, or Garder's-island. Having remained in Iceland during the winter, he returned in the fpring to Norway, where he described the new-discovered island as a pleafant well-wooded country. This excited a defire in Floke, another Swede, reputed the greatest navigator of his time, to undertake a voyage thither. As the compafs was then unknown, he took three ravens on board to employ them on the difcovery. By the way he vifited his friends at Ferro; and having failed farther to the northward, he let fly one of his ravens, which returned to Ferro. Some time after, he

lecland, where the thip arrived a few days after. Floke flaid certain conditions agreed on between them; and the Iceland. here the whole winter with his company; and, befide, he gave the country the name of Iceland, which it has ever fince retained.

When they returned to Norway in the following fpring, Floke, and those that had been with him, made a very different description of the country. Floke try suffered incredibly through the absence of its godescribed it as a wretched place; while one of his companions, named Thorulfr, praised it so highly, that he affirmed butter dropped from every plant; which extravagant commendation procured him the name of

Thorulfr-Imior, or Butter-Thorulfr.

From this time there are no accounts of any voyages to Iceland, till Ingolfr and his friend Leifr undertook one in 874. They fpent the winter on the island, and determined to fettle there for the future. Ingolfr returned to Norway, to provide whatever might be necessary for the comfortable establishment of a colony, and Leifr in the mean time went to affift in the war in England. After an interval of four years, they again met in Iceland, the one bringing with him a confiderable number of people, with the necessary tools and inftruments for making the country habitable; and the other imported his acquired treasures. After this period many people went there to fettle; and, in the space of 60 years, the whole island was inhabited. The tyranny of Harold king of Norway contributed not a little to the population of Iceland; and fo great was the emigration of his fubjects, that he was at laft obliged to iffue an order, that no one should fail from Norway to Iceland without paying four ounces of fine filver to the king.

Besides the Norwegians, new colonies arrived from different nations, between whom wars foon commenced; and the Icelandic histories are full of the accounts of their battles. To prevent these conflicts for the future, a kind of chief was chosen in 928, upon whom great powers were conferred. This man was the speaker in all their public deliberations; pronounced fentence in difficult and intricate cafes; decided all difputes; and published new laws, after they had been received and approved of by the people at large: but he had no power to make laws without the approbation and confent of the reft. He therefore affembled the chiefs, whenever the circumstances feemed to require it; and, after they had deliberated among themselves, he reprefented the opinion of the majority to the people, whofe affent was necessary before it could be considered as a law. His authority among the chiefs and leaders, however, was inconfiderable, as he was chofen by them, and retained his place no longer than while he preferved their confidence.

This inflitution did not prove sufficient to restrain the turbulent spirit of the Icelanders. They openly waged war with each other; and, by their intestine conflicts, fo weakened all parties, that the whole became at last a prey to a few arbitrary and enterprising men; who, as is too generally the case, wantonly of them put themselves under the protection of Hakans

rest followed their example in 1264. Afterwards, cause he found a great deal of floating ice on the north Iceland, together with Norway, became subject to Denmark. For a long time the care of the island was committed to a governor, who commonly went there once a-year; though, according to his inftructions, he ought to have relided in Iceland. As the counvernors, it was refolved a few years ago that they should reside there, and have their seat at Bessessitedr. one of the old royal domains. He has under him a bailiff, two laymen, a fheriff, and 21 syffelmen, or magiftrates who superintend small districts; and almost every thing is decided according to the laws of Den-

> At the first fettlement of the Norwegians in Iceland, Manners they lived in the fame manner as they had done in their &c. of the own country, namely, by war and piracy. Their Icelanders. fituation with regard to the kings of Norway, however, foon obliged them to apply to other states, in order to learn as much of the knowledge of government and politics as was necessary to preferve their colony from subjugation to a foreign yoke. For this purpose they often failed to Norway, Denmark, Sweden, England, and Scotland. The travellers, at their return, were obliged to give an account to their chiefs of the flate of those kingdoms through which they passed. For this reason, history, and what related to science, was held in high repute as long as the republican form of government lasted; and the great number of histories to be met with in the country, show at least the defire of the Icelanders to be inftructed. To fecure themfelves, therefore, against their powerful neighbours, they were obliged to enlarge their historical knowledge. They likewise took great pains in studying perfectly their own laws, for the maintenance and protection of their internal fecurity. Thus Iceland, at a time when ignorance and obscurity overwhelmed the rest of Europe, was enabled to produce a confiderable number of poets and historians. When the Christian religion was introduced about the end of the 10th century, more were found converfant in the law than could have been expected, confidering the extent of the country, and the number of its inhabitants. Fishing was followed among them; but they devoted their attention. confiderably more to agriculture, which has fince entirely ceafed.

Two things have principally contributed towards producing a great change both in their character and way of life, viz. the progress of the Christian religion, and their fubjection first to Norway, and afterwards to Denmark. For if religion, on one fide, commanded them to defift from their ravages and warlike expeditions; the fecular power, on the other, deprived them of the necessary forces for the execution of them: and, fince this time, we find no farther traces of their heroic deeds, except those which are preserved in their hiftories.

The modern Icelanders apply themselves to fishing abused their power to the oppression of their country- and breeding of cattle. They are middle-fized and men, and the difgrace of humanity. Notwithstanding well-made, though not very strong; and the women these troubles, however, the Icelanders remained free are in general ill-seatured. Vices are much less comfrom a foreign yoke till 1261; when the greatest part mon among them, than in other parts where luxury and riches have corrupted the morals of the people. king of Norway, promiting to pay him tribute upon Though their poverty disables them from imitating

sceland, the hospitality of their ancestors in all respects, yet wadmal, and reaches down to the ankles. Round the sceland. they continue to show their inclination to it : they cheerfully give away the little they have to spare, and express the utmost joy and satisfaction if you are plea-fed with their gift. They are uncommonly obliging and faithful, and extremely attached to government. They are very zealous in their religion. An Icelander never passes a river or any other dangerous place, without previously taking off his hat, and imploring the divine protection; and he is always thankful for the protection of the Deity when he has passed the danger in fafety. They have an inexpreffible attachment to their native country, and are nowhere fo happy. An Icelander therefore rarely fettles in Copenhagen, though ever fuch advantageous terms fhould be offered him. On the other hand, we cannot afcribe any great industry or ingenuity to these people. They work on in the way to which they have all along been accuftomed, without thinking of improvements. They are not cheerful in conversation, but simple and credulous; and have no aversion against a bottle, if they can find an opportunity. When they meet together, their chief pastime consists in reading their history. The master of the house makes the beginning, and the rest continue in their turns when he is tired. Some of them know these stories by heart; others have them in print, and others in writing. Besides this, they are great players at chefs and cards, but only for their amusement, fince they never play for money : which, however, feems to have been formerly in use among them; fince, by one of their old laws, a fine is impofed upon those who play for money.

The modern Icelanders have made very little alteration in their drefs from what was formerly in ufe. The men all wear a linen shirt next to the skin, with a short jacket, and a pair of wide breeches over it. When they travel, another fhort coat is put over all. The whole is made of coarse black cloth, called wadmal; but some wear clothes of a white colour. On their head they wear large three-cornered hats, and on their feet Iceland shoes and worsted stockings. Some of them indeed have shoes from Copenhagen; but, as they are rather too dear for them, they generally make their own shoes, sometimes of the hide of oxen, but more frequently of sheep's leather. They make them by cutting a fquare piece of leather, rather wider than the length of the foot; this they few up at the toes and behind at the heel, and tie it on with leather thongs. These shoes are convenient enough where the country is level; but it would be very difficult for us who are not accustomed to walk with them amongst the rocks and stones, though the Icelanders do it with

great eafe. The women are likewife dreffed in black wadmal. They wear a bodice over their shifts, which are sewed up at the bosom; and above this a jacket laced before with long narrow fleeves reaching down to the wrifts. In the opening on the fide of the fleeve, they have buttons of chased filver, with a plate fixed to each button; on which the lover, when he buys them in order to prefent them to his mistress, takes care to have his name engraved along with hers. At the top of the jacket a little black collar is fixed, of about three inches broad, of velvet or filk, and frequently trimmed with gold cord. The petticoat is likewife of

top of it is a girdle of filver or fome other metal, to which they faften the apron, which is also of wadmal. and ornamented at top with buttons of chafed filver. Over all this they wear an upper-drefs nearly refembling that of the Swedish peasants; with this difference, that it is wider at bottom : this is close at the neck and wrifts, and a hand's-breadth shorter than the petticoat. It is adorned with a facing down to the bottom, which looks like cut velvet, and is generally wove by the Icelandic women. On their fingers they wear gold, filver, or brass rings. Their head-dress confifts of feveral cloths wrapped round the head al-most as high again as the face. It is tied fast with a handkerchief, and ferves more for warmth than ornament. Girls are not allowed to wear this head-dress till they are marriageable. At their weddings they are adorned in a very particular manner: the bride wears, close to the face, round her head-dress, a crown of filver gilt. She has two chains round her neck, one of which hangs down very low before, and the other rests on her shoulders. Besides these, she wears a leffer chain, from whence generally hangs a little heart, which may be opened to put some kind of perfume in it. This drefs is worn by all the Icelandic women without exception : only with this difference, that the poorer fort have it of coarse wadmal, with ornaments of brass; and those that are in easier circumstances have it of broad cloth, with filver ornaments gilt.

The houses of the Icelanders are very indifferent, Houses, but the worst are said to be on the fouth side of the island. In some parts they are built of drift-wood, in others of lava, almost in the same manner as the stonewalls we make for inclosures, with moss stuffed between the pieces of lava. In fome houses the walls are wainfcotted on the infide. The roof is covered with fods, laid over rafting, or fometimes over the ribs of whales; the walls are about three yards high, and the entrance fomewhat lower. Inflead of glass, the windows are made of the chorion and amnios of sheep, or the membranes which furround the womb of the ewe. These are stretched on a hoop, and laid over a hole in the roof. In the poorer fort of houses they employ for the windows the inner membrane of the stomach of animals, which is less transparent than the others.

As the island of Iceland produces no kind of grain, the inhabitants of confequence have no bread but what is imported; and which being too dear for common use, is referved for weddings and other entertainments. The following lift of their viands is taken from Troil's Letters.

" I. Flour of fialgras, (lichen islandicus, or rockgrass. The plant is first washed, and then cut into fmall pieces by fome ; though the greater number dry it by fire or in the fun, then put it into a bag in which it is well beaten, and laftly work it into a flour by flamping.

" 2. Flour of komfyrg, (polygonum bistorta), is prepared in the fame manner, as well as the two other forts of wild corn melur (Arundo arenaria, and Arundo foliorum lateribus convolutis), by feparating it from the chaff, pounding, and laftly grinding it.

" 3. Surt Smoer, (four butter). The Icelanders feldom make use of fresh or salt butter, but let it grow

Iceland. four before they eat it. In this manner it may be look upon it as more wholefome and palatable than the butter used among other nations. It is reckoned better the older it grows; and one pound of it then is valued as much as two of fresh butter.

four milk, and preferved for the winter.

" 4. Fish of all kinds, both dried in the fun and in the air, and either falted or frozen. Those prepared in the last manner are preferred by many.

" 5. The flesh of bears, sheep, and birds, which is partly falted, partly hung or fmoked, and fome preserved in casks with sour or fermented whey poured over it.

" 6. Mifoft, or whey boiled to cheefe, which is very good. But the art of making other kinds of good cheefe is loft, though fome tolerably palatable is fold in the east quarter of Iceland.

" 7. Beina string, bones and cartilages of beef and mutton, and likewife bones of cod, boiled in whey till they are quite diffolved : they are then left to ferment,

and are eat with milk.

66 8. Skyr. The curds from which the whey is fqueezed are preferved in casks or other vessels; they are fometimes mixed with black crow-berries or juniper berries, and are likewife eat with new milk.

" Q. Swa, is four whey kept in casks, and left to ferment; which, however, is not reckoned fit for use

till a year old.

" 10. Blanda, is a liquor made of water, to which a twelfth part of fyra is added. In winter, it is mixed with the juice of thyme and of the black crow-

" 1.1. They likewife eat many vegetables, fome of which grow wild, and fome are cultivated; also shell-

fish and mushrooms."

The Icelanders in general eat three meals a-day, at feven in the morning, two in the afternoon, and nine at night. In the morning and evening they commonly eat curds mixed with new milk, and fometimes with juniper or crow berries. In some parts, they also have pottage made of rock grafs, which is very palatable, or curdled milk boiled till it becomes of a red colour, or new milk boiled a long time. At dinner, their food confifts of dried fish, with plenty of four butter; they also sometimes eat fresh fish, and, when possible, a little bread and cheese with them. It is reported by some, that they do not eat any fish till it is quite rotten; this report perhaps proceeds from their being fond of it when a little tainted: they however frequently eat fish which is quite fresh, though, in the fame manner as the rest of their food, often without falt.

Their common beverage is milk, either warm from the cow or cold, and fometimes boiled: they likewife use butter-milk with or without water. On the coasts they generally drink blanda and four milk; which is fold after it is skimmed at two-fifths of a rixdollar- they formerly were, infomuch that it is computed they per cask: some likewise send for beer from Copenhagen, and some brew their own. A few of the princiveronica officinalis.

On the coasts the men employ themselves in fish. Iceland. kept for 20 years, or even longer; and the Icelanders ing, both summer and winter. On their return home, when they have drawn and cleaned their fish, they give them to their wives, whose care it is to dry them. In Employthe winter, when the inclemency of the weather pre-nufactures, vents them from fishing, they are obliged to take care &c. " 3. String, or whey boiled to the confiftence of of their cattle, and spin wool. In summer, they mow the grafs, dig turf, provide fuel, go in fearch of theep and goats that were gone aftray, and kill cattle. They prepare leather with the fpiraca ulmaria instead of bark. Some few work in gold and filver; and others are inftructed in mechanics, in which they are tolerable proficients. The women prepare the tifh, take care of the cattle, manage the milk and wool, few, fpin, and gather eggs and down. When they work in the evening, they use, instead of an hour glass, a lamp with a wick made of epilobium dipt in train oil, which is contrived to burn four, fix, or eight

> Among the common people of Iceland, time is not reckoned by the course of the fun, but by the work they have done, and which is prefcribed by law. According to this prescription, a man is to mow as much hay in one day as grows on 30 fathoms of manured foil, or 40 fathoms of land which has not been manured; or he is to dig 700 pieces of turf eight feet long and three broad. If as much fnow falls as reaches to the horses bellies, a man is required daily to clear a piece of ground fufficient for 100 sheep. A woman is to rake together as much hav as three men can mow, or to weave three yards of wadmal a-day.

> The wages of a man are fixed at four dollars and 12 yards of wadmal; and those of a woman at two dollars and five yards of wadmal. When men are fent a-fishing out of the country, there is allowed to each man, by law, from the 25th of September to the 14th of May, fix pounds of butter, and 18 pounds of dried fish every week. This may feem to be too great an allowance; but it must be remembered that they have nothing elle to live upon. When they are at home, and can get milk, &c. every man receives only five pounds of dried fish and three quarters of a pound of butter a-week.

The food and mauner of life of the Icelanders by no Difeafes. means contribute to their longevity. It is very rare indeed to see an inhabitant of Iceland exceed the age of 50 or 60; and the greater part are attacked by grievous diseases before middle age. Of these the feurvy and elephantialis or leprofy are the worit. They are also subject to the gout in their hands, owing to their frequent employment in fishing, and handling the wet fishing tackle in cold weather. St Anthony's fire, the jaundice, pleurify, and lowness of spirits, are frequent complaints in this country. The imall-pox also is exceedingly fatal, and not long ago destroyed 16,000 persons. By these diseases, and the frequent famines with which the country has been afflicted, the inhabitants are reduced to a much fmaller number than do not in all exceed 60,000.

The exports of Iceland confift of dried fish, falted Commerce. pal inhabitants also have claret and coffee. The com- mutton and lamb, beef, butter, tallow, train-oil, and remon people fometimes drink a kind of tea, which they 'coarfe woollen cloth, flockings, gloves, raw wool, venue make from the leaves of the dryas octopetala, and the sheep skins, lamb skins, fox-turs of various colours, eider down, feathers, and formerly fulphurs but there is

Iceland no longer a demand for this mineral. On the other hand, the Icelanders import timber, fishing-lines and hooks, tobacco, bread, horfe-shoes, brandy, wine, falt, linen, a little filk, and a few other necessaries, as well as superfluities for the better fort. The whole trade of Iceland is engroffed by a monopoly of Danes, indulged with an exclusive charter. This company maintains factories at all the harbours of Iceland, where they exchange their foreign goods for the merchandize of the country; and as the balance is in favour of the Icelanders, pay the overplus in Danish money, which is the only current coin in this island. All their accounts and payments are adjusted according to the number of fish: two pounds of fish are worth two skillings in specie, and 48 fish amount to one rixdollar. A Danish crown is computed at 30 fish : what falls under the value of 12 fish cannot be paid in money; but must be bartered either for fish or roll-tobacco, an ell of which is equal to one fish. The weights and measures of the Icelanders are nearly the same with those used in Denmark. The Icelanders being neither numerous nor warlike, and altogether unprovided with arms, ammunition, garrifons, or fleets, are in no condition to defend themselves from invasion, but depend entirely on the protection of his Dauith majesty, to whom they are subject. The re venues which he draws from this island confift of the income of divers estates, as royal demesne, amounting to about 8000 dollars per amum; of the money paid by the company for an exclusive trade, to the value of 20,000 dollars; and of a fixed proportion in the tythes of fish paid in some particular districts.

> Iceland is noted for the volcanoes with which it abounds, as already mentioned, and which feem to be more furious than any yet discovered in the other parts of the globe. Indeed, from the latest accounts, it would feem that this miferable country were little other than one continued volcano. Mount Hecla has been commonly supposed to be the only burning mountain, or at least the principal one, in the island; (fee HECLA). It has indeed been more taken notice of than many others of as great extent, partly from its having had more frequent eruptions than any fingle one, and partly from its fituation, which exposes it to the fight of thips failing to Greenland and North America. But in a lift of eruptions published in the appendix to Pennant's Arctic Zoology, it appears, that out of 51 remarkable ones, only one third have proceeded from Hecla, the other mountains it feems being no less active in the work of destruction than this celebrated one. These eruptions take place in the mountains covered with ice, which the inhabitants call Jokuls. Some of thefe, as appears from a large map of Iceland made by order of his Danish Majesty in 1734, have been swallowed up. Probably the great lakes met with in this country may have been occafioned by the finking of fuch mountains, as feveral inflances of a fimilar nature are to be met with in other parts of the world. The great Icelandic lake called Myvatu may probably have been one. Its bottom is entirely formed of lava, divided by deep cracks, which shelter during winter the great quantity of trouts which inhabit this lake. It is now only 30 feet deep: but originally was much deeper; being nearly filled up in the year 1728 by an eruption of the great mountain

Krafte. The fiery fiream took its course towards Iceland. Myvatu, and ran into it with an horrid noise, which continued till the year 1730.

" The mountains of Iceland (fays Mr Pennant) are of two kinds, primitive and posterior. The former confift of strata usually regular, but sometimes confufed. They are formed of different forts of stone without the leaft appearance of fire. Some are composed of fand and free stone, petrofilex or chirt, slaty or fiffile stone, and various kinds of earth or bole, and steatitæ: different forts of breccia or conglutinated stones; jafpers of different kinds, Iceland cryftal; the common rhomboid fuathum, chalcedonies ftratified, and botrooid: zeolites of the most elegant kinds; crystals, and various other substances that have no relation to volcanoes. These primitive mountains are those called Tokuls, and are higher than the others. One of them, called Æfian or Rias, is 6000 feet high. It feems to be composed of great and irregular rocks of a dark grey colour, piled on each other. Another, called Enneberg, is about 3000 feet high; the Snæfeld Jokul, 2287 yards; the Snafieldnas or promontory of Snafield is from 300 to 400 fathoms. Hornstrand or the coast by the north Cape Nord is very high, from 300 to 400 fathoms. The rocks of Drango are feven in number, of a pyramidal figure, rifing out of the fea at a fmall distance from the cliffs, four of which are of a vast height, and have a most magnificent appearance.

" Eastward from the Snafield begins the Eisberge. foaring to a vail height; many parts of which have felt the effects of fire, and in some of the melted rocks are large cavities. Budda-lekkur, a rock at one end of this mountain, is also volcanic, and has in it a great cavern hung with flalactite. The name of Solvabamar is given to a tremendous range of volcanic rocks, composed entirely of flags, and covered in the feafon with fea-fowl. It would be endless, however, to mention all the places which bear the marks of fire in various . forms, either by having been vitrified, changed into a fiery colour, ragged and black, or bear the marks of having run for miles in a floping course towards the

These volcanoes, though so dreadful in their effects, feldom begin to throw out fire without giving warning, A fubterraneous rumbling noise heard at a confiderable diftance, as in other volcanoes, precedes the eruption for feveral days, with a roaring and cracking in the place from whence the fire is about to burlt forth ; many fiery meteors are observed, but generally unattended with any violent concussion of the earth, though fometimes earthquakes, of which feveral instances are recorded, have accompanied these dreadful conflagrations. The drying up of small lakes, streams, and rivulets, is also confidered as a fign of an impending eruption; and it is thought to hasten the eruption when a mountain is fo covered with ice, that the holes are flopped up through which the exhalations formerly found a free passage. The immediate sign is the burfting of the mass of ice with a dreadful noise : flames then iffue forth from the earth, and lightning and fire balls from the fmoke; stones, ashes, &c. are thrown out to vast distances. Egbert Olassen relates. that, in an eruption of Kattle gian in 1755, a stone weighing 290 pounds was thrown to the diffance of 21 English miles. A quantity of white pumice stone is

of Iceland.

gion in

x783.

Iceland. thrown up by the boiling waters; and it is conjectured with great probability, that the latter proceeds from the sea, as a quantity of falt, sufficient to load several horses, has frequently been found after the mountain

has ceased to burn.

To enumerate the ravages of fo many dreadful volcanoes, which from time immemorial have contributed to render this dreary country still less habitable than it is from the climate, would greatly exceed our The coun-limits. It will be fufficient to give an account of that which happened in 1783, and which from its violence

by an erup-feems to have been unparalleled in history. Its first figns were observed on the 1st of June by a trembling of the earth in the western part of the province of Shapterfiall. It increased gradually to the 11th, and became at last fo great that the inhabitants quitted their houses, and lay at night in tents on the ground. A continual fmoke or fleam was perceived rifing out of the earth in the northern and uninhabited parts of the country. Three fire-spouts, as they were called, broke out in different places, one in Ulfarsdal, a little to the east of the river Skapta; the other two were a little to the westward of the river called Ilwerfisfliot. The river Skapta takes its rife in the northeast, and running first westward, it turns to the fouth, and falls into the fea in a foutheast direction. Part of its channel is confined for about 24 English miles in length, and is in fome places 200 fathoms deep, in others 100 or 150, and its breadth in some places 100, 50, or 40 fathoms. Along the whole of this part of its course the river is very rapid, though there are no confiderable cataracts or falls. There are feveral other fuch confined channels in the country, but this is the most considerable.

The three fire-fpouts, or streams of lava, which had broke out, united into one, after having rifen a confiderable height into the air, arriving at last at such an amazing altitude as to be feen at the distance of more than 200 English miles; the whole country, for double that diffance, being covered with a fmoke or

fleam not to be described.

On the 8th of June this fire first became visible. Vast quantities of fand, ashes, and other volcanic matters were ejected, and scattered over the country by the wind, which at that time was very high. The atmosphere was filled with fand, brimstone, and ashes, in fush a manner as to occasion continual darkness; and confiderable damage was done by the pumice flones which fell, red hot, in great quantities. Along with these a tenacious substance like pitch fell in vast quantity; fometimes rolled up like balls, at other times like rings or garlands, which proved no lefs destructive to vegetation than the other. This shower having continued for three days, the fire became very visible, and at last arrived at the amazing height already mentioned. Sometimes it appeared in a continued ftream, at others in flashes or flames seen at the diftance of 30 or 40 Danish miles (180 or 240 of ours), with a continual noise like thunder, which lasted the whole fummer.

The fame day that the fire broke out there fell a vast quantity of rain, which running in streams on the hot ground tore it up in large quantities, and brought it down upon the lower lands. This rain-water was much impregnated with acid and other falts, fo as to be

highly corrolive, and occasion a painful fensation when Iceland. it fell on the hands or face. At a greater distance from the fire the air was excessively cold. Snow lay upon the ground three feet deep in fome places; and in others there fell great quantities of hail, which did very much damage to the cattle and every thing without doors. Thus the grass and every kind of vegetation in those places nearest the fire was destroyed. being covered with a thick crust of sulphureous and footy matter. Such a quantity of vapour was raifed by the contest of the two adverse elements, that the fun was darkened and appeared like blood, the whole face of nature feeming to be changed; and this obfcurity feems to have reached as far as the island of Britain; for during the whole fummer of 1783, an obscurity reigned throughout all parts of this island; the atmosphere appearing to be covered with a continual haze, which prevented the fun from appearing with his usual splendor.

The dreadful fcene above described lasted in Iceland for feveral days; the whole country was laid waste, and the inhabitants fled every where to the remotest parts of their miferable country, to feek for fafety from

the fury of this unparalleled tempeft.

On the first breaking out of the fire, the river Skapta was confiderably augmented, on the east fide of which one of the fire spouts was fituated; and a fimilar overflow of water was observed at the same time in the great river Piorfa, which runs into the fea a little to the eastward of a town called Orrebakka, and into which another river called Tuna, after having run through a large tract of barren and uncultivated land, empties itself. But on the 11th of June the waters of the Skapta were leffened, and in lefs than 24 hours totally dried up. The day following, a prodigious stream of liquid and red-hot lava, which the fire-spout had discharged, ran down the channel of the river. This burning torrent not only filled up the deep channel above mentioned, but, overflowing the banks of it, spread itself over the whole valley, covering all the low grounds in its neighbourhood; and not having any fufficient outlet to empty itself by, it rose to a vast height, so that the whole adjacent country was overflowed, infinuating itself between the hills, and covering fome of the lower ones. The hills here are not continued in a long chain or feries, but are feparated from one another, and detached, and between them run little rivulets or brooks; fo that, befides filling up the whole valley in which the river Skapta ran, the fiery stream spread itself for a considerable distance on each side, getting vent between the above mentioned hills, and laying all the neighbouring country under fire.

The fpouts still continuing to supply fresh quantities of inflamed matter, the lava took its course up the channel of the river, overflowing all the grounds above, as it had done those below the place whence it iffued. The river was dried up before it, until at last it was flopped by the hill whence the Skapta takes its rife. Finding now no proper outlet, it rose to a prodigious height, and overflowed the village of Buland, confuming the houses, church, and every thing that flood in its way; though the high ground on which this village flood feemed to enfure it from any danger of this

The fiery lake fill increafing, fpread itself out in their lives. The extent above mentioned, however, is lecland. length and breadth for about 36 English miles; and that only on the fourth, east, and west; for that towards having converted all this tract of land into a fea of fire, it firetched itself towards the fouth, and getting vent again by the river Skapta rushed down its channel with great impetuosity. It was still confined between the narrow banks of that river for about fix miles (English); but coming at last into a more open place, it poured forth in prodigious torrents with amazing velocity and force; spreading itself now towards the fouth, tearing up the earth, and carrying on its furface flaming woods and whatfoever it met with. In its course it laid waste another large district of land. The ground where it came was cracked, and fent forth great quantities of fleam long before the fire reached it : and every thing near the lake was either burnt up or reduced to a fluid state. In this fituation matters remained from the 12th of June to the 13th of August; after which the fiery lake no longer fpread itself, but nevertheless continued to burn ; and when any part of the furface acquired a crust by cooling, it was quickly broken by the fire from below; and this tumbling down among the melted fubflance, was rolled and toffed about with prodigious noise and crackling; and in many parts of its surface, small fpouts or at least ebullitions were formed, which continued for fome length of time.

In other directions this dreadful inundation proved no less destructive. Having run through the narrow part of the channel of Skapta as early as the 12th of Tune, it ftretched out itself towards the west and southwest, overflowing all the flat country, and its edge being no less than 70 fathoms high at the time it got out of the channel of the river. Continuing its de-fructive course, it overflowed a number of villages, running in every direction where it could find a vent. In one place it came to a great cataract of the river Skapta, about 14 fathoms in height, over which it was precipitated with tremendous noise, and thrown in great quantities to a very confiderable distance. In another place it stopped up the channel of a large river, filled a great valley, and destroying two villages by approaching only within 100 fathoms of them. Others were overflowed by inundations of water proceeding from the rivers which had been stopped in their courfes; until at last all the passages on the south, east, and west, being stopped, and the spouts still sending up incredible quantities of fresh lava, it burst out to the north and northeast, spreading over a tract of land 48 miles long and 36 broad. Here it dried up the rivers Tuna and Axafyrdi; but even this vast effusion being infufficient to exhauft the fubterraneous refources of liquid fire, a new branch took its course for about eight miles down the channel of the river Ilwerfufliot, when coming again to an open country, it formed what our author calls a fmall lake of fire, about twelve miles in length and fix in breadth. At laft, however, this branch also stopped on the 16th of August; the fiery fountains ceased to pour for thnew supplies, and this most astonishing eruption came to a period.

The whole extent of ground covered by this dreadful inundation was computed at no less than 90 miles long and 42 in breadth; the depth of the lava being from 16 to 20 fathoms. Twelve rivers were driedup, 20 or 21 villages were deftroyed, and 224 people loft

the north being over uninhabited land, where no body cared to venture themselves, was not exactly known. Some hills were covered by this lava; others were melted down by its heat; fo that the whole had the appearance of a fea of red-hot and melted metal.

After this eruption two new islands were thrown up from the bottom of the fea. One, about three miles in circumference, and about a mile in height, made its appearance in the month of February 1784, where there was formerly 100 fathoms water. It was about 100 miles fouthwest from Iceland, and 48 from a cluster of fmall islands called Gierfugla. It continued for fome time to burn with great violence, fending forth prodigious quantities of pumice stones, fand, &c. like other volcanoes. The other lay to the northwest, be-tween Iceland and Greenland. It burnt day and night without intermission for a considerable time; and was also very high, and larger than the former. Since that time, however, one or both of these islands have

been swallowed up.

All the time of this great eruption, and for a confiderable time after, the whole atmosphere was loaded with smoke, steam, and sulphureous vapours. The fun was fometimes wholly invifible; and when it could be feen was of a reddish colour. Most of the fisheries were destroyed; the banks where the fish used to refort being fo changed, that the fishermen could not know them again; and the fmoke was fo thick, that they could not go far out to fea. The rain water, falling through this smoke and steam, was so impregnated with falt and fulphureous matter, that the hair and even the fkin of the cattle were destroyed; and the whole grafs of the ifland was fo covered with foot and pitchy matter, that what had escaped the destructive effects of the fire became poisonous; fo that the cattle died for want of food, or perished by cating those unwholefome vegetables. Nor were the inhabitants in a much better fituation; many of them having loft their lives by the poisonous qualities of the fmoke and fteam with which the whole atmosphere was filled: particularly old people, and fuch as had any complaint in the breaft and lungs.

Before the fire broke out in Iceland, there is faid to have been a very remarkable eruption in the uninhabited parts of Greenland; and that in the northern parts of Norway, opposite to Greenland, the fire was visible for a long time. It was also related, that when the wind was in the north, a great quantity of ashes, pumice, and brimftone, fell upon the north and weit coafts of Iceland, which continued for the whole fummer whenever the wind was in that quarter; and the air was always very much impregnated with a thick

fmoke and fulphureous fmell.

During the fall of the sharp rain formerly mentioned, there was observed at Trondheim, and other places. in Norway, and likewife at Faw, an uncommon fall of fharp and falt rain, which totally destroyed the leaves. of the trees, and every vegetable it fell upon, by fcorching them up, and caufing them to wither. A confiderable quantity of ashes, fand, and other volcanic matters, fell at Faro, which covered the whole furface of the ground whenever the wind blew from Iceland, though the distance between the two places is not

Iceland. lefs than 480 miles. Ships that were failing betwixt Copenhagen and Norway were frequently covered with ashes and sulphureous matter, which stuck to the masts, fails, and decks, befmearing them all over with a black and pitchy substance. In many parts of Holland, Germany, and other northern countries, a fulphureous vapour was observed in the air, accompanied with a thick smoke, and in some places a light were absolved from this duty. grey-coloured fubftance fell upon the earth every night; which, by yielding a bluish slame when thrown into the fire, evidently showed its sulphureous nature. On those nights in which this fubstance fell in any

Vhorkelyn's account of cient flate of this ifland.

quantity, there was little or no dew observed. These appearances continued, more or lefs, all the months of July, August, and September. Some curious particulars relative to the ancient state of this island have lately been published by a Mr Vhorkelyn, a native of the country. From his work it appears that Iceland, for a very confiderable space of time, viz. from the beginning of the 10th to the middle of the 13th century, was under a republican form of government. At first the father, or head of every family, was an absolute sovereign; but in the progress of population and improvement, it became neceffary to form certain regulations for the fettlement of difputes concerning the frontiers of different effates. For this purpose the heads of the families concerned affembled themselves, and formed the outlines of a republic. In the mean time they carried on a profperous trade to different parts; fending ships even to the Levant, and to Constantinople, at that time celebrated as the only feat of literature and humanity in the world. Deputies were likewife fent from this island over land to that capital, for the improvement of their laws and civilization; and this a whole century before the first crusade. In these ancient Icelandic laws, therefore, we meet with evident traces of those of the Greeks

and Romans. For example, befides a body of written

laws which were written every third year to the people,

they had two men chosen annually by the heads of fa-

milies, with confular power, not only to enforce the

laws then in being, but when these proved deficient, to

act as necessity required. These laws do not appear to have inflicted capital punishments upon any person. Murderers were banished to the wood; that is, to the interior and uncultivated parts of the ifland; where no person was allowed to approach them within a certain number of fathoms. In cases of banishment for lesser crimes, the friends of the offender were allowed to supply him with necessaries. The culprit, however, might be killed by any person who found him without his bounds; and he might even be hunted and destroyed in his fanctuary, provided he did not withdraw himfelf from the island within a twelvemonth after his fentence, which it was fupposed he might accomplish by means of the annual arrival and departure of ships. Every man's person was free until he had forfeited his rights by some crime against fociety; and fo great was their respect for independence, that great indulgence was allowed for the power of passion. If any provoking word or behaviour had been used, no punishment was inflicted on the party who refented it, even though he should have killed his adverfary.

Nº 163.

By the laws of Iceland, the poor were committed Iceland to the protection of their nearest kindred, who had a schneumonright to their labour as far as they were able to work, and afterwards to indemnification if the poor person fhould acquire any property. Children were obliged to maintain their parents in their old age; but if the latter had neglected to give them good education, they

While the republic of Iceland continued free and independent, ships were sent from the island to all parts of the world. Till very lately, however, not a ship belonged to it, the little commerce it enjoyed being monopolized by a Danish company, until in 1786 it was laid open to all the subjects of Denmark, "There is at prefent (fays Mr Pennant *) a revival of the cod ' Appendit fishery on the coast of Iceland from our kingdom. A. to Artis bout a dozen of veffels have of late failed from the ifle Zoology, of Thanet, and a few from other parts of Great Britain. They are either floops or brigs from 50 to 80 tons burden. A lugfail boat, fuch as is used in the herring fishery, failed last season from Yarmouth thus equipped. The crew confifted of five men from the town, and five more taken in at the Orkneys. They had twelve lines of 120 fathoms each, and 200 or 300 hooks; fix heading knives, twelve gutting and twelve splitting knives. They take in 18 tons of salt at Leith, at the rate of three tons to every thousand fish; of which fix or seven thousand is a load for a vessel of this kind. They go to fea about the middle of April; return by the Orkneys to land the men; and get into their port in the latter end of August or beginning of September. Pytheas fays, that Iceland lies fix days failing from Great Britain. A veffel from Yarmouth was, in the last year, exactly that time in its voyage from the Orkneys to Iceland. With a fair wind it might be performed in far less time; but the winds about the Ferroe ifles are generally changeable."

ICELAND Agate; a kind of precious stone met with in the islands of Iceland and Ascension, employed by the jewellers as an agate, though too foft for the purpose. It is supposed to be a volcanic product: being folid, black, and of a glaffy texture. When held between the eye and the light, it is femitranfparent and greenish like the glass bottles which contain much iron. In the islands which produce it. fuch large pieces are met with that they cannot be equalled in any glass-house.

ICENI, the ancient name of the people of Suffolk, Norfolk, Cambridgeshire, and Huntingdonshire, in England.

ICH-DIEN. See HERALDRY, chap. iv. fect. 2.

ICHNEUMON in zoology. See VIVERRA. ICHNEUMON, is also the name of a genus of flies of the hymenoptera order. The mouth is armed with jaws, without any tongue; the antennæ have above 30 joints; the abdomen is generally petiolated, joined to the body by a pedicle or stalk; the tail is armed with a fting, which is inclosed in a double-valved cylindrical fheath; the wings are lanceolated and plain. This genus is exceedingly numerous. In Gmelin's or the 13th edit. of the Systema Natura, no fewer than 415 species are enumerated. They are divided into

breunion families, from the colour of their fcutellum and anand antennæ annulated with a whitish band. 2. Those which have a white efcutcheon, and antennæ entirely black. 2. With a fcutcheon of the fame colour as the thorax; the antennæ encompassed with a fillet-4. With a feutcheon of the fame colour as the thorax: and antennæ black and fetaceous. 5. With fetaceous clay-coloured antennæ. 6. With small filiform au-

> tennæ, and the abdomen oval and slender. One diffinguishing and firiking character of these frecies of flies is the almost continual agitation of their antenna. The name of Ichneumon has been applied to them, from the service they do us by destroying caterpillars, plant-lice, and other infects; as the ichneumon or mangouste destroys the crocodiles. The variety to be found in the species of ichneumons is prodigious: among the smaller species there are males who perform their amorous preludes in the most pasfionate and gallant manner. The posterior part of the females is armed with a wimble, visible in some species, no ways discoverable in others; and that inftrument, though fo fine, is able to penetrate through mortar and plafter: the ftructure of it is more easily feen in the long-wimbled fly. The food of the family to be produced by this fly is the larva of wasps or masonbees: for it no fooner espies one of those nests, but it fixes on it with its wimble, and bores through the mortar of which it is built. The wimble itfelf, of an admirable ftructure, confifts of three pieces; two collateral ones, hollowed out into a gutter, ferve as a fheath, and contain a compact, folid, dentated ftem, along which runs a groove that conveys the egg from the animal, who supports the wimble with its hinder legs, left it should break, and by a variety of movements, which it dexteroufly performs, it bores through the building, and deposits one or more eggs, according to the fize of the ichneumon, though the largest drop but one or two. Some agglutinate their eggs upon caterpillars; others penetrate through the caterpillar's eggs, though very hard, and deposit their own in the infide. When the larva is hatched, its head is fo fituated, that it pierces the caterpillar, and penetrates to its very entrails. These larvæ pump out the nutritions juices of the caterpillar, without attacking the vitals of the creature; who appears healthy, and even fometimes transforms itself to a chryfalis. It is not uncommon to fee those caterpillars fixed upon trees, as if they were fitting upon their eggs, and it is afterwards discovered that the larvæ, which were within their bodies, have foun their threads, with which, as with cords, the caterpillars are fastened down, and fo perish miserably. The ichneumons performed special fervice, in the years 1731 and 1732; by multiplying in the fame proportion as did the caterpillars, their larvæ destroyed more of them than could be effected by human industry. Those larvæ, when on the point of turning into chryfalids, fpin a filky cod. Nothing is more furprifing and fingular, than to fee those cods leap when placed on the table or hand. Plant-lice, the larvæ of the curculiones, and fpider's eggs, are al-To fometimes the cradle of the ichneumon-fly. Carcases of plant lice, void of motion, are often found on rose-tree leaves; they are the habitation of a small larva, which, after having eaten up the entrails, de-Vot. IX. Part I.

ftrovs the fprings and inward economy of the plant. Ichnogratennæ, as follow: 1. Those with a whitish scutcheon, louse, performs its metamorphosis under shelter of the pellicle which enfolds it, contrives itself a small cir- lebthyocular outlet, and fallies forth into open air. There collaare ichneumons in the woods, who dare attack foiders. run them through with their fling, tear them to pieces, and thus avenge the whole nation of flies of fo formidable a foe: others, deftitute of wings (and those are females), deposit their eggs in spiders nests. The ichneumon of the bedeguar, or fweet-briar fponge, and that of the rofe-tree, perhaps only deposit their eggs in those places, because they find other insects on which they feed. The genus of the ichneumon-flies might with propriety be termed a race of diminutive canibals.

ICHNOGRAPHY, in perspective, the view of any thing cut off by a plane, parallel to the horizon, just at the base of it .- The word is derived from the Greek xx footstep, and spape I write, as being a description of the footsteps or traces of a work.

Among painters it fignifies a description of images or of ancient flatues of marble and copper, of bufts and femi-bufts, of paintings in fresco, mosaic works,

and ancient pieces of miniature.

ICHOGLANS, the grand fignior's pages ferving in the feraglio. These are the children of Christian parents, either taken in war, purchased, or sent in presents from the viceroys and governors of distant provinces; they are the most sprightly, beautiful, and well-made that can be met with; and are always reviewed and approved of by the grand fignior himfelf before they are admitted into the feraglios of Pera, Conftantinople, or Adrianople, being the three colleges where they are educated, or fitted for employments, according to the opinion the court entertains of them.

ICHOR, properly fignifies a thin watery humour like ferum; but is fometimes used for a thicker kind

flowing from ulcers, called also fanies.

ICHTHYOCOLLA, Isinglass, a preparation from the fish known by the name of bufo. See ACCIPENSER. The word is Greek, formed of 1χθυς fish, and κολλα glue.—The method of making Isinglas was long a secret in the hands of the Rusfians; but hath lately been discovered, and the following account of it published by Humphrey Jackson, Efg; in the 63d volume of the Philosophical Transactions,

" All authors who have hitherto delivered proceffes for making ichthyocolla, fish-glue, or ifinglass, have greatly mistaken both its constituent matter and

preparation.

"To prove this affertion, it may not be improper to recite what Pomet fays upon the subject, as he appears to be the principal author whom the rest have copied. After describing the fish, and referring to a cut engraved from an original in his custody, he fays; ' As to the manner of making the ifinglass, the finewy parts of the fish are boiled in water till all of them be dissolved that will dissolve; then the glucy liquor is strained, and fet to cool. Being cold, the fat is carefully taken off, and the liquor itself boiled to a just confiftency, then cut to pieces, and made into a twift, bent in form of a crefcent, as commonly fold; then hung upon a ftring, and carefully dried.

" From this account, it might be rationally con-

Ichthyo- cluded, that every species of fish which contained gelatinous principles would yield ifinglass: and this parity of reasoning seems to have given rise to the halty conclusions of those who strenuously vouch for the extraction of isinglass from sturgeon; but as that fish is easily procurable, the negligence of afcertaining the

fact by experiment feems inexcufable. " In my first attempt to discover the constituent parts and manufacture of ifinglass, relying too much upon the authority of fome chemical authors whose veracity I had experienced in many other instances, I found myself constantly disappointed. Glue, not ifinglass, was the result of every process; and although, in the same view, a journey to Russia proved fruitless, yet a fleady preseverance in the research proved not only successful as to this object, but, in the pursuit, to discover a resinous matter plentifully procurable in the British fisheries, which has been found by ample experience to answer fimilar purposes. It is now no longer a fecret, that our (A) lakes and rivers in North America are stocked with immense quantities of fish, faid to be the same species with those in Muscovy, and yielding the finest ifinglass; the fisheries whereof, under due encouragement, would doubtless supply all Europe with this valuable article.

" No artificial heat is necessary to the production of ifinglass, neither is the matter dissolved for this purpose; for, as the continuity of its fibres would be destroyed by folution, the mass would become brittle in drying, and fnap fhort afunder, which is always the case with glue, but never with isinglass. The latter, indeed, may be refolved into glue with boiling water; but its fibrous recomposition would be found impracticable afterwards, and a fibrous texture is one of the most diftinguishing characteristics of ge-

nuine ifinglafs.

" A due confideration that an imperfect folution of ifinglass, called fining by the brewers, possessed a peculiar property of clarifying malt-liquors, induced me to attempt its analyfis in cold subacid mentruums. One ounce and an half of good ifinglass, fleeped a few days in a gallon of stale beer, was converted into good fining, of a remarkably thick confishence: the fame quantity of glue, under fimilar treatment, yielded only a mucilaginous liquor, refembling diluted gumwater, which, instead of clarifying beer, increased both its tenacity and turbidness, and communicated other properties in no respect corresponding, with those of genuine fining. On commixing three spoonfuls of the folution of ifinglass with a gallon of malt liquor, in a tall cylindrical glass, a vast number of curdly maffes became prefently formed, by the reciprocal attraction of the particles of ilinglass and the feculencies of the beer, which, increasing in magnitude and

specific gravity, arranged themselves accordingly, and Ichthyofell in a combined flate to the bottom, through the well-known laws of gravitation; for, in this cafe, there is no elective attraction, as fome have imagined, which bears the least affinity with what frequently occurs in chemical decompositions:

" If what is commercially termed long or fort flatled ifinglals be freeped a few hours in fair cold water, the entwifted membranes will expand, and reassume their original beautiful (t) hue, and, by a dexterous address, may be perfectly unfolded. By this simple operation, we find that itinglass is nothing more than certain membrahous parts of limes, divelted of their native mucofity, rolled and twifted into the forms above mention-

ed, and dried in open air.

" The founds, or air-bladders, of fresh water fish in general, are preferred for this purpole, as being the most transparent, flexible, delicate substances, These conflitute the finest forts of isinglass; those called book and ordinary flaple, are made of the inteftines, and probably of the peritonaum of the fish. The belluga yields the greatest quantity, as being the largest and most plentiful fish in the Muscovy rivers; but the founds of all fresh-water fish yield, more or less, fine ifinglass, particularly the smaller forts, found in prodigious quantities in the Caspian Sea, and several hundred miles beyond Aftracan, in the Wolga, Yaik, Don, and even as far as Siberia, where it is called kle or kla by the natives, which implies a glutinous matter; it is the basis of the Russian glue, which is preferred to all other kinds for its ftrength.

" The founds, which yield the finer ifinglass, confift of parallel fibres, and are easily rent longitudinally; but the ordinary forts are found composed of double membranes, whose fibres cross each other obliquely, refembling the coats of a bladder: hence the former are more readily pervaded and divided with fubacid liquors; but the latter, through a peculiar kind of interwoven texture, are with great difficulty torn afunder, and long refift the power of the same menstruum : yet, when duly refolved, are found to act with equal

energy in clarifying liquors.

"Ifinglass receives its different shapes in the follow-

ing manner: "The parts of which it is composed, particularly the founds, are taken from the fish while sweet and fresh, slit open, washed from their slimy fordes, divested of every thin membrane which envelopes the found, and then exposed to stiffen a little in the air. In this state, they are formed into rolls about the thickness of a finger, and in length according to the intended fize of the staple: a thin membrane is generally selected for the centre of the roll, round which the reft are folded alternately, and about half an inch of each ex-

tremity

(B) If the transparent isinglals be held in certain politions to the light, it frequently exhibits beautiful prif-

matic colours.

⁽A) As the lakes of North America lie nearly in the same latitude with the Caspian Sea, particularly lake Superior, which is faid to be of greater extent, it was conjectured they might abound with the same forts of fish; and in consequence of public advertisements distributed in various parts of North America, offering premiums for the founds of sturgeon and other fish, for the purpose of making isinglass, several specimens of fine isinglass, the produce of fish taken in these parts, have been lately sent to England, with proper attestations as to the unlimited quantity which may be procured.

tremity of the roll is turned inwards. The due dimensions being thus obtained, the two ends of what is called fort flaple are pinned together with a fmall wooden peg; the middle of the roll is then preffed a little downwards, which gives it the refemblance of a heart-shape; and thus it is laid on boards, or hung up in the air to dry. The founds, which compose the long-flaple, are longer than the former; but the operator lengthens this fort at pleasure, by interfolding the ends of one or more pieces of the found with each other. The extremities are fastened with a peg, like the former; but the middle part of the roll is bent more confiderably downwards; and, in order to preferve the shape of the three obtuse angles thus formed, a piece of round flick, about a quarter of an inch diameter, is fastened in each angle with small wooden pegs, in the fame manner as the ends. In this flate, it is permitted to dry long enough to retain its form, when the pegs and flicks are taken out, and the drying completed; lattly, the pieces of ifinglass are colligated in rows, by running packthread through the peg-holes, for convenience of package and expor-

" The membranes of the book fort, being thick and refractory, will not admit a fimilar formation with the preceding; the pieces, therefore, after their fides are folded inwardly, are bent in the centre, in fuch manner that the opposite sides refemble the cover of a book, from whence its name; a peg being run across the middle, fastens the sides together, and thus it is dried like the former. This fort is interleaved, and the pegs run across the ends, the better to prevent its unfolding.

"That called cake-ifinglass is formed of the bits and fragments of the staple forts, put into a flat metalline pan, with a very little water, and heated just enough to make the parts cohere like a pancake when it is dried; but frequently it is overheated, and fuch pieces, as before observed, are useless in the business of fining. Experience has taught the confumers to

reject them.

" Itinglass is best made in the summer, as frost gives it a difagreeable colour, deprives it of weight, and impairs its gelatinous principles; its fashionable forms are unnecessary, and frequently injurious to its native qualities. It is common to find oily purid matter, and exurvia of infects, between the implicated membranes, which, through the inattention of the cellarman, often contaminate wines and malt-liquors in the act of clarification. These peculiar shapes might, probably, be introduced originally with a view to conceal and difguife the real fubitance of ifinglass, and preserve the monopoly; but, as the mask is now taken off, it cannot be doubted to answer every purpose more effectually is its native state, without any subsequent manufacture whatever, especially to the principal confumers, who hence will be enabled to procure fufficient fupply from the British colonies. Until this laudable end can be fully accomplished, and as a species of ifinglass, more easily produceable from the marine fisheries, may probably be more immediately encouraged, it may be manufactured as follows:

"The founds of cod and ling bear great analogy with those of the accipenser genus of Linnæus and Ar-

tedi; and are in general fo well known as to require Ichthyono particular description. The Newfoundland and Iceland fishermen split open the fish as soon as taken, and throw the back bones, with the founds annexed, in a heap; but previous to incipient putrefaction, the founds are cut out, washed from their slimes, and salted for ufe. In cutting out the founds, the intercollal parts are left behind, which are much the best; the Iceland fishermen are so fensible of this, that they beat the bone upon a block with a thick flick, till the pockets, as they term them, come out eafily, and thus preserve the found entire. If the founds have been cured with falt, that must be diffolved by steeping them in water before they are prepared for ifinglass; the fresh found must then be laid upon a block of wood, whose surface is a little elliptical, to the end of which a fmall hair brush is nailed, and with a faw knife the membranes on each fide of the found must be feraped off. The knife is rubbed upon the brush occafionally, to clear its teeth; the pockets are cut open with fciffars, and perfectly cleanfed of the mucous matter with a coarse cloth; the founds are afterwards washed a few minutes in lime-water in order to absorb their oily principle, and lattly in clear water. They are then laid upon nets to dry in the air; but if intended to refemble the foreign ifinglass, the founds of cod will only admit of that called book, but those of ling both shapes. The thicker the founds are, the better the ifinglass, colour excepted; but that is immaterial to the brewer, who is its chief confumer.

" This ifinglass resolves into fining, like the other forts, in fubacid liquors, as stale beer, cyder, old hock, &c. and in equal quantities produces fimilar effects upon turbid liquors, except that it falls speedier and closer to the bottom of the vessel, as may be demonstrated in tall cylindrical glasses; but foreign isinglass retains the confidency of fining preferably in warm weather, owing to the greater tenacity of its native

" Vegetable acids are, in every respect, best adapted to fining: the mineral acres are too correfive, and

even infalubrious, in common beverage.

" It is remarkable, that, during the conversion of ifinglass into fining, the acidity of the menstruum seems greatly diminished, at least to taste; not on account of any alkaline property in the ifinglass, probably, but by its inveloping the acid particles. It is likewife reducible into jelly with alkaline liquors, which indeed are folvents of all animal matters; even cold lime-water diffolves it into a pulpous magma. Notwithstanding this is inadmiffible as fining, on account of the mentruum, it produces admirable effects in other refpects: for, on commixture with compositions of plaiter, lime, &cc. for ornamenting walls exposed to viciffitudes of weather, it adds firmness and permanency to the cement; and if common brick-mortar be worked up with this jelly, it foon becomes almost as hard as the brick itself : but, for this purpose, it is more commodiously prepared, by dissolving it in cold water, acidulated with vitriolic acid; in which case, the acid quits the jelly, and forms with the lime a felenitic mass, while, at the fame time, the jelly being deprived in fome measure of its moisture, through the formation of an indiffoluble concrete amongst its parts, foon

Ichthyo- dries, and hardens into a firm hody : whence its fuperior strength and durability are easily comprehended.

" It has long been a prevalent opinion, that flurgeon, on account of its cartilaginous nature, would vield great quantities of ifinglass; but, on examination, no part of this fift, except the inner coat of the found, promifed the leaft fuccefs. This being full of ruge, adheres fo firmly to the external membrane, which is ufelefs, that the labour of feparating them fuperfedes the advantage. The intestines, however, which in the larger fifth extend feveral vards in length, being cleanfed from their mucus, and dried, were found furprifingly ftrong and elaftic, refembling cords made with the intestines of other animals, commonly called cat-gut, and, from fome trials, promifed fuperior advantages when applied to mechanic operations."

Ifinglass is sometimes used in medicine; and may be given in a thin acrimonious state of the juices, after the fame manner as the vegetable gums and mucilages, regard being had to their different disposition to putre-

ICHTHYOLOGY, the science of fishes, or that part of zoology which treats of fishes. See FISH.

Fishes form the fourth class of animals in the Linnæan fystem. This class is there arranged into fix orders, under three great divisions; none of which, however, include the cetaceous tribes, or the whale, dolphin, &c. these forming an order of the class Mam-MALIA in the fame fystem. See Zoology.

Mr Pennant, in his British Zoology, makes a different and very judicious arrangement, by which the cetæ are restored to their proper rank. He distributes fish into three divisions, comprehending fix orders. His divisions are, into Cetaceous, Cartilaginous, and

Claffifica-

tion of

fifter.

Div. I. CETACIOUS Fift; the characters of which are the following: No gills; an orifice on the top of the head, through which they breathe and eject water; a flat or horizontal tail; exemplified in Plate CCLI. (lower compartment), fig. 1. by the Beaked Whale, borrowed from Dale's Hift. Harw. 411. Tab. xiv .- This division comprehends three genera; the Whale, Cachalot, and Dolphin.

Div. II. CARTILAGINOUS Fift; the characters of which are: Breathing through certain apertures, generally placed on each fide the neck; but in fome instances beneath, in some above, and from one to seven in number on each part, except in the pipe-fish, which has only one; the muscles supported by cartilages inflead of bones. Example, the Picked Dog-fish, fig. 2. a, The lateral apertures .- The genera are, the Lamprey, Skate, Shark, Fishing-frog, Sturgeon, Sun-fish, Lump-fish, Pipe-fish.

Div. III. Bonr Fifb; includes those whose muscles are supported by bones or spines, which breathe thro' gills covered or guarded by thin bony plates, open on the fide, and dilatable by means of a certain row of bones on their lower part, each feparated by a thin web; which bones are called the radii branchioflegi, or the gill covering rays. The tails of all the fish that form this division are placed in a situation perpendicular to the body; and this is an invariable character.

The great fections of the Bony Fish into Apodal,

Thoracic, Jugular, and Abdominal, he copies from Lin- Ichthyanæus: who founds this fystem on a comparison of the ventral fins to the feet of land-animals or reptiles; and either from the want of them, or their particular fituation in respect to the other fins, establishes his fections .- In order to render them perfectly intelligible, it is necessary to refer to those several organs of movement, and fome other parts, in a perfect fish, or one taken out of the three last fections. In fig. 4. (the Haddock), a, is the pectoral fins; b, ventral fins; c, anal fins ; d, caudal fin, or the tail ; e, e, e, dorfal fins : f, bony plates that cover the gills ; g, branchioftegous rays and their membranes; b, lateral or fide

Sect. 1. APODAL: The most imperfect, wanting the ventral fins; illustrated by the Conger, fig. 3. This also expresses the union of the dorsal and anal fins with the tail, as is found in fome few fish .- Genera: The Eel, Wolf-fish, Launce, Morris, Sword-

Sect. 2. JUGULAR: The ventral fins b, placed before the pectoral fins a, as in the Haddock, fig. 4 .--Genera : The Dragonet, Weever, Codfish, Blenny. Sect. 3. THORACIC: The ventral fins a, placed be-

neath the pectoral fins b, as in the Father Lafther, fig. 5.—Genera: The Goby, Bull-head, Dorce, Flounder, Gilt head, Wrasse, Perch, Stickleback, Mackarel, Surmullet, Gurnard.

Sect. 4. ABDOMINAL: The ventral fins placed behind the pectoral fins, as in the Minow, fig. 6 .- Genera: The Loche, Salmon, Pike, Argentine, Athe-

rine, Mullet, Flying fish, Herring, Carp.

Naturalits observe an exceeding great degree of wif- Shape of dom in the structure of fishes, and in their conforma-fishes adtion to the element in which they are to live, Most mirably fitof them have the same external form, sharp at either tedfor swift end, and swelling in the middle, by which they are motion. enabled to traverse the fluid in which they reside with greater velocity and eafe. This shape is in some measure imitated by men in those vessels which they design to fail with the greatest swiftness; but the progress of the fwiftest failing ship is far inferior to that of fishes. Any of the large fishes overtake a ship in full fail with the greatest ease, play round it as though it did not move at all, and can get before it at pleafure.

The chief instruments of a fish's motion have been Uses of the

fupposed to be the fins; which in some are much more finsandtails numerous than in others. A fish completely fitted for of fishes. fwimming with rapidity, is generally furnished with two pair of fins on the fides, and three fingle ones, two above, and one below. But it does not always happen that the fish which has the greatest number of fins is the fwiftest swimmer. The shark is thought to be one of the swiftest fishes, and yet it has no fins. on its belly; the haddock feems to be more completely fitted for motion, and yet it does not move fo fwiftly. It is even observable, that some fishes which have no fins at all, fuch as lobsters, dart forward with prodigious rapidity, by means of their tail; and the instrument of progressive motion, in all fishes, is now found to be the tail. The great use of the fins is to keep the body in equilibria: and if the fins are cut off, the fish can still swim; but will turn upon its fides or its back, without being able to keep itself in an erect, posture as before. If the fish defires to turn, a blow

Ichthyo- from the tail fends it about in an instant; but if the logy. tail strikes both ways, then the motion is progressive.

All fishes are furnished with a slimy glutinous matter, which defends their bodies from the immediate contact of the furrounding fluid, and which likewife, in all probability, affifts their motion through the water. Beneath this, in many kinds, is found a ftrong covering of feales, which, like a coat of mail, defends it still more powerfully; and under that, before we come to the mufcular parts of the body, lies an oily fubftance, which also tends to preserve the requisite

Arguments fiftes to land animals.

to thefe

warmth and vicour. By many naturalists fishes are considered as of a nafor the in- ture very much inferior to land animals, whether heafts feriority of or birds. Their fenfe of feeling, it is thought, must be very obscure on account of the scaly coat of mail in which they are wrapped up. The fenfe of fmelling alfo, it is faid, they can have only in a very fmall degree. All fishes, indeed, have one or more nostrils; and even those that have not the holes perceptible without, yet have the bones within, properly formed for fmelling. But as the air is the only medium we know proper for the distribution of odours, it cannot be supposed that these animals which reside constantly in the water can be affected by them. As to tafting, they feem to make very little distinction. The palate of most fishes is hard and bony, and confequently incapable of the powers of relishing different subflances; and accordingly these voracious animals have often been observed to swallow the fisherman's plummet instead of the bait. Hearing is generally thought to be totally deficient in fifthes, notwithstanding the difcoveries of fome anatomists who pretend to have found out the bones defigned for the organ of hearing in their heads. They have no voice, it is faid, to communicate with each other, and confequently have no need of an organ for hearing. Sight feems to be that fense of which they are possessed in the greatest degree ; and yet even this feems obscure, if we compare it with that of other animals. The eye, in almost all fishes, is covered with the fame transparent skin which covers the rest of the head, and which probably serves to defend it in the water, as they are without evelids. The globe is more depressed anteriorly, and is furnished behind with a muscle which serves to lengthen or flatten it as there is occasion. The crystalline humour, which in quadrupeds is flat, and of the shape of a buttonmould, or like a very convex lens, in fishes is quite round, or fometimes oblong like an egg. Hence it is thought that fiftes are extremely near fighted; and that, even in the water, they can perceive objects only at a very small distance. Hence, say they, it is evident how far fishes are below terrestrial animals in their fenfations, and confequently in their enjoyments. Even their brain, which is by fome supposed to be of a fize with every creature's understanding, shows that fishes are very much inferior to birds in this respect.

Objections Others argue differently with regard to the nature of fishes .- With respect to the sense of feeling, say arguments, they, it cannot be justly argued that fishes are deficient, merely because they are covered with scales, as it is possible these scales may be endued with as great a power of fensation as we can imagine. The sense of feeling is not properly connected with fofiness in any organ, more than with bardness in it. A fimilar

argument may be used with regard to smelling; for Ichthoy in though we do not know how fmells can be propagated . water, that is by no means a proof that they are not fo. On the contrary, as water is found to be capable of abforbing putrid effluyia from the air, nothing is more probable than that these putrid effluvia, when mixed with the water, would affect the olfactory organs of fifnes, as well as they affect ours when mixed with the air .- With regard to tafte, it certainly appears, that fishes are able to diffinguish their proper food from what is improper, as well as other animals. Indeed, no voracious animal feems to be endued with much fenfibility in this respect; nor would it probably be confiftent with that way of promifcuoufly devonring every creature that comes within its reach, without which these kinds of animals could not sabsist.

With respect to the hearing of fishes, it is urged, Sense of

that, when kept in a pond, they may be made to hearing, answer at the call of a whiftle or the ringing of a bell; and they will even be terrified at any fudden and violent noife, fuch as thunder, the firing of guns, &c. and shrink to the bottom of the water. Among the ancients, many were of opinion that fishes had the fense of hearing, though they were by no means fatisfied about the ways or passages by which they heard. Placentini afterwards discovered some bones in the head of the pike, which had very much the appearance of being organs of hearing, though he could never discover any external passages to them. Klein affirmed, from his own experiments and observations, that all fishes have the organs of hearing; and have also passages from without to these organs, though in many species they are difficult to be feen; and that even the most minute and obscure of these are capable of communicating a tremulous motion to those organs, from founds issuing from without. This is likewise afferted by M. Geoffroy +, who gives a particular description of the + Differtor organs of hearing belonging to feveral species. These tion fur l'ora organs are a fet of little bones extremely hard, and gane de white, like fine porcelain, which are to be found in Foure, p. 970. the heads of all fishes: The external auditory passages are very fmall; being fcarce fufficient to admit a hog's briftle; though with care they may be diftinguished in almost all fishes. It can by no means be thought that the water is an improper medium of found, feeing daily experience shows us that founds may be conveyed not only through water, but through the most folid bodies \$. It feems indeed very difficult to determine ! See A the matter by experiment. Mr Gouan, who kept couffices. fome gold fishes in a vase, informs us, that whatever noise he made, he could neither terrify nor diffurb them; he halloo'd as loud as he could, putting a piece of paper between his mouth and the water, to prevent the vibrations from affecting the furface, and the fishes fill feemed infenfible : but when the paper was removed, and the found had its full effect on the water, the cafe was then altered, and the fishes instantly funk to the bottom. This experiment, however, or others fimilar to it, cannot prove that the fishes did not hear the founds before the paper was removed; it only shows that they were not alarmed till a fensible vibration wasintroduced into the water. The call of a whille may also be supposed to affect the water in a fish-pond with a vibratory motion: but this certainly must be very obscure; and if fishes can be affembled in this manner.

Ichthyo- when no person is in fight, it amounts to a demonstration that they actually do hear. See Comparative ANATOMY, nº 167.

The arguments used against the fight of fishes are the weakest of all. Many instances which daily occur, show that fishes have a very acute fight, not only of objects in the water, but of those in the air. Their jumping out of the water in order to catch flies is an abundant proof of this; and this they will continue to do in a fine fummer evening, even after it is fo dark that we cannot diftinguish the infects they attempt to

Fishes cannot live without nir.

Though fishes are formed for living entirely in the water, yet they cannot fubfist without air. On this fubject Mr Hawksbee made several experiments, which are recorded in the Philosophical Transactions. The fishes he employed were gudgeons; a species that are very lively in the water, and can live a confiderable time out of it. Three of them were put into a glass veffel with about three pints of fresh water, which was defigned as a flandard to compare the others by. Into another glass, to a like quantity of water, were put three more gudgeons, and thus the water filled the glass to the very brim. Upon this he screwed down a brass plate with a leather below, to prevent any communication between the water and the external air; and, that it might the better resemble a pond frozen over, he fuffered as little air as possible to remain on the furface of the water. A third glass had the same quantity of water put into it; which, first by boiling, and then by continuing it a whole night in vacuo, was purged of its air as well as possible; and into this also were put three gudgeons. In about half an hour, the fishes in the water from whence the air had been exhausted, began to discover some signs of uneasiness by a more than ordinary motion in their mouths and gills. Those who had no communication with the external air, would at this time also frequently ascend to the top, and fuddenly fwim down again: and in this flate they continued for a confiderable time, without any fentible alteration. About five hours after this observation, the fishes in the exhausted water were not so active as before, upon shaking the glass which contained them. In three hours more, the included fishes lay all at the bottom of the glass with their bellies upwards; nor could they be made to shake their fins or tail by any motion given to the glass. They had a motion with their mouths, however, which showed that they were not perfectly dead. On uncovering the veffel which contained them, they revived in two or three hours, and were perfectly well next morning; at which time those in the exhausted water were also recovered. The veffel containing these last being put under the receiver of an air pump, and the air exhausted, they all instantly died. They continued at top while the air remained exhaulted, but funk to the bottom on the admission of the atmosphere.

The use of air to fishes is very difficult to be explained; and indeed their method of obtaining the fupply of which they stand constantly in need, is not easily accounted for. The motion of the gills in fishes is certainly analogous to our breathing, and feems to The fish first takes a quantity of water by the mouth, fresh supplies; and as the body grows, the conduits

which is driven to the gills; thefe close, and keep the Ichthyowater which is swallowed from returning by the mouth, while the bony covering of the gills prevents it from going through them till the animal has drawn the proper quantity of air from it : then the bony covers open. and give it a free passage; by which means also the gills are again opened, and admit a fresh quantity of water. If the fish is prevented from the free play of its gills, it foon falls into convulfions, and dies. But though this is a pretty plaufible explanation of the respiration of fishes, it remains a difficulty not easily folved what is done with this air. There teems to be no receptacle for containing it, except the air bladder or fwim; which, by the generality of modern philosophers, is destined not to answer any vital purpofe, but only to enable the fift to rife or fink at plea-

The air-bladder is a bag filled with air, composed of the use fometimes of one, fometimes of two, and fometimes of of the airthree divisions, fituated towards the back of the fifth, fifthes. and opening into the maw or the gullet. The use of this in raifing or depressing the fish, is proved by the following experiment. A carp being put into the airpump, and the air exhaulted, the bladder is faid to burth by the expansion of the air contained in it; after which, the fish can no more rife to the top, but ever afterwards crawls at the bottom. The fame thing alfo happens when the air-bladder is pricked or wounded in fuch a manner as to let the air out; in these cases also the fish continues at the bottom, without a possibility of rifing to the top. From this it is inferred, that the use of the air-bladder is, by swelling at the will of the animal, to increase the surface of the fish's body, and thence diminishing its specific gravity, to enable it to rife to the top of the water, and to keep there at pleafure. On the contrary, when the fifth wants to descend, it is thought to contract the airbladder; and being thus rendered fpecifically heavier. it descends to the bottom.

The ancients were of opinion, that the air-bladder in fifthes ferved for fome purposes effentially necessary to life; and Dr Priestley also conjectures, that the raifing or depreffing the fish is not the only use of these air-bladders, but that they also may serve some other purpofes in the occonomy of fithes. There are many arguments indeed to be used on this fide of the queftion : the most conclusive of which is, that all the cartilaginous kind of fishes want air-bladders, and yet they rife to the top or fink to the bottom of the water without any difficulty; and though most of the eelkind have air bladders, yet they cannot raife themfelves in the water without great difficulty.

Fishes are remarkable for their longevity. " Most Longevity of the diforders incident to mankind (fays Bacon) arife of files. from the changes and alterations in the atmosphere; but fishes reside in an element little subject to change : theirs is an uniform existence; their movements are without effort, and their life without labour. Their bones, also, which are united by cartilages, admit of indefinite extension; and the different sizes of animals of the same kind, among fishes, is very various. They ftill keep growing : their bodies, instead of fuffering be the operation by which they feparate the air from the rigidity of age, which is the cause of the natural the water. Their manner of breathing is as follows. decay of land animals, still continue increasing with

Motion of the gills of fishes analogous to our breat ing.

ing their

long a fish, that feems to have fcarce any bounds put to its growth, continues to live, is not afcertained: perhaps the life of a man would not be sufficient to Methods of measure that of the smallest."-There have been two determinmethods fallen upon for determining the age of fishes; the one is by the circles of the scales, the other by the transverse section of the back bone. When a fish's scale is examined by a microscope, it is found to confift of a number of circles one within another, in fome measure resembling those which appear on the transverse section of a tree, and is supposed to give the fame information. For, as in trees, we can tell their age by the number of their circles : fo, in fishes, we can tell theirs by the number of circles in every fcale, reckoning one ring for every year of the animal's existence. - The age of fishes that want scales anay be known by the other method, namely, by feparating the joints of the back-bone, and then minutely obferving the number of rings which the furface, where it was joined; exhibits.

Extreme voracity of Sihes.

zing in-

eycafo,

Fishes are, in general, the most voracious animals in nature. In most of them, the maw is placed next the mouth; and, though possessed of no fensible heat, is endowed with a very furprifing faculty of digestion. Its digeftive power feems, in fome measure, to increase in proportion to the quantity of food with which the fish is supplied. A single pike has been known to deyour 100 roaches in three days. Whatever is poffeffed of life, feems to be the most defirable prey for fishes. Some that have very small mouths, feed upon worms, and the spawn of other fish : others, whose mouths are larger, feek larger prey; it matters not of what kind, whether of their own species, or any other. Those with the largest mouths pursue almost every thing that hath life; and often meeting each other in fierce oppofition, the fish with the largest swallow comes off with Their ama- the victory, and devours its antagonist .- As a counterbalance to this great voracity, however, fishes are incredibly prolific. Some bring forth their young alive, others produce only eggs ; the former are rather the least fruitful; yet even these produce in great abundance. The viviparous blenny, for instance, brings forth 200 or 300 at a time. Those which produce eggs, which they are obliged to leave to chance, either on the bottom where the water is shallow, or floating on the furface where it is deeper, are all much more prolific, and feem to proportion their flock to the danger there is of confumption .- Lewenhoeck affures us, that the cod spawns above nine millions in a season. The flounder commonly produces above one million, and the mackarel above 500,000. Scarce one in 100 of these eggs, however, brings forth an animal: they are devoured by all the leffer fiy that frequent the fhores, by water-fowl in shallow waters, and by the larger fishes in deep waters. Such a prodigious increase, if permitted to come to maturity, would overflock nature; even the ocean itself would not be able to contain, much less provide for, one half of its inhabitants. But two wife purpofes are answered by this amazing increase; it preserves the species in the midst of numberlefs enemies, and ferves to furnish the rest with a sustenance adapted to their nature.

With respect to the generation of many kinds of fishes, the common opinion is, that the female deposits

Ichthye- of life furnish their stores in greater abundance. How her spawn or eggs, and that the male afterwards ejects Ichthyehis sperm or male semen upon it in the water. The want of the organs of generation in fishes gives an ap- Ickenild. parent probability to this: but it is strenuously oppofed by Linnæus. He affirms, that there can be no possibility of impregnating the eggs of any animal out of its body. To confirm this, the general course of nature, not only in birds, quadrupeds, and infects, but even in the vegetable world, has been called in to his affiftance, as proving that all impregnation is performed while the egg is in the body of its parent ; and he funplies the want of the organs of generation by a very strange process, affirming, that the males eject their femen always fome days before the females deposit their ova or fpawn; and that the females fwallow this, and thus have their eggs impregnated with it. He fays, that he has frequently feen, at this time, three or four females gathered about a male, and greedily fnatching up into their mouths the femen he ejects. He mentions fome of the efoces, fome pearch, and fome of the cyprini, in which he had feen this process. But fee COMPARATIVE Anatomy, nº 154.

Many opinions have been ftarted in order to account how it happens that fishes are found in pools, and ditches, on high mountains, and elfewhere. Gmelin observes, that the duck-kind swallow the eggs of fishes; and that some of these eggs go down, and come out of their bodies unhurt, and fo are propagated just in the same manner as has been observed of

plants.

For a more particular view of the structure of fishes,

fee COMPARATIVE Anatomy, nº 146-167.

ICHTHYOPHAGI, FISH-EATERS, a name given to a people, or rather to feveral different people, who lived wholly on fifthes. The word is Greek, compounded of 1xous pifeis, "fish," and paler edere, " to eat."

The Ichthyophagi fpoken of by Ptolemy are placed by Sanfon in the provinces of Nanquin and Xantong. Agatharcides calls all the inhabitants between Carmania

and Gedrofia by the name Ichthyophagi.

From the accounts given us of the Ichthyophagi by Herodotus, Strabo, Solinus, Plutarch, &c. it appears indeed that they had cattle, but that they made no ufe of them, excepting to feed their fift withal. They made their houses of large fish-bones, the ribs of whales ferving them for their beams. The jaws of these animals ferved them for doors; and the mortars wherein they pounded their fish, and baked it at the fun, were nothing elfe but their vertebræ.

ICHTHYPERIA, in natural biftory, a name given by Dr Hill to the bony palates and mouths of fishes, usually met with either fossile, in fingle pieces, or in fragments. They are of the fame fubftance with the bufonitæ; and are of very various figures, fome broad and fhort, others longer and flender; fome very gibbofe, and others plainly arched. They are likewife of various fizes, from the tenth of an inch to two inches

in length, and an inch in breadth.

ICKENILD-STREET, is that old Roman highway. denominated from the Icenians, which extended from Yarmouth in Norfolk, the east part of the kingdom of the Iceni, to Barley in Hertfordshire, giving name in the way to feveral villages, as Ickworth, Icklingham. and Ickleton in that kingdom. From Barley to Royston it divides the counties of Cambridge and Hertand Oxfordshire, passes the Thames at Goring, and extends to the west part of England. ICOLMKIL. See IONA.

ICONIUM, at present Cogni, formerly the capital city of Lycaonia in Afia Minor. St Paul coming to Iconium (Acts xiii. 51. xiv. 1. &c.) in the year of Christ 45, converted many Jews and Gentiles there. It is believed, that in his first journey to this city, he converted St Thecla, fo celebrated in the writings of the ancient fathers. But fome incredulous Jews excited the Gentiles to rife against Paul and Barnabas, fo that they were upon the point of offering violence to them, which obliged St Paul and St Barnabas to fly for fecurity to the neighbouring cities. St Paul undertook a fecond journey to Iconium in the year 51: but we know no particulars of his journey, which relate peculiarly to Iconium.

ICONOCLASTES, or ICONOCLASTE, breakers of images; a name which the church of Rome gives to all who reject the use of images in religious matters .-The word is Greek, formed from sixus imago, and

xxx rumpere, "to break."

In this fense, not only the reformed, but some of the castern churches, are called Iconoclastes, and esteemad by them heretics, as opposing the worship of the images of God and the faints, and breaking their fi-

gures and reprefentations in churches.

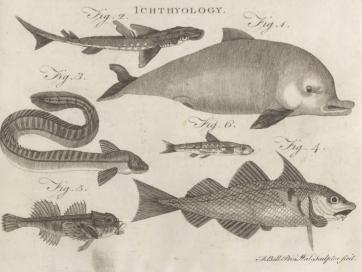

The opposition to images began in Greece under the reign of Bardanes, who was created emperor of the Greeks a little after the commencement of the eighth century, when the worship of them became common. See IMAGE. But the tumults occasioned by it were quelled by a revolution, which, in 713, deprived Bardanes of the imperial throne. The dispute, however, broke out with redoubled fury under Leo the Isaurian. who issued out an edict in the year 726, abrogating, as fome fay, the worship of images, and ordering all the images, except that of Chrilt's crucifixion, to be removed out of the churches; but according to others, this edict only prohibited the paying to them any kind of adoration or worship. This edict occasioned a civil war, which broke out in the islands of the Archipelago, and by the fuggestions of the priests and monks, ravaged a part of Asia, and afterwards reached Italy. The civil commotions and infurrections in Italy were chiefly promoted by the Roman pontiffs, Gregory I. and II. Leo was excommunicated, and his fubjects in the Italian provinces violated their allegiance, and rifing in arms either maffacred or banished all the emperor's deputies and officers. In confequence of these proceedings, Leo affembled a council at Constantinople in 730, which degraded Germanus, the bishop of that city, who was a patron of images; and he ordered all the images to be publicly burnt, and inflicted a variety of fevere punish. ments upon fuch as were attached to that idolatrous worthip. Hence arose two factions; one of which adopted the adoration and worship of images, and on that account were called iconoduli or iconolatra; and the other maintained that fuch worship was unlawful, and that nothing was more worthy the zeal of Christians than to demolish and destroy those statues and pictures which were the occasions of this gross idolatry; and hence they were distinguished by the titles of iconomachi, (from wav image, and wax I contend,) and iconoclasse. The zeal of Gre-Nº 163.

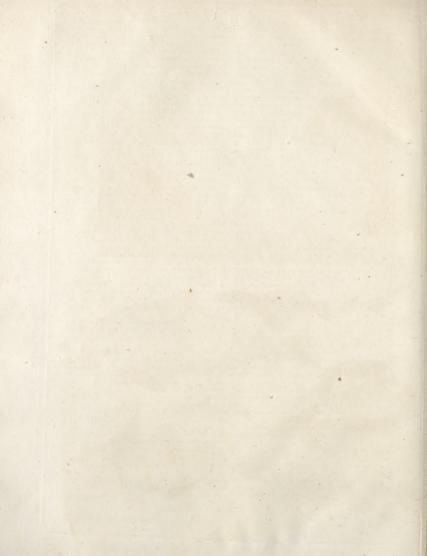

Icolankil ford. From Ickleford it runs by Tring, croffes Bucks gory II. in favour of image worship, was not only imig Icongelag tated, but even furpassed by his successor Gregory III. in confequence of which the Italian provinces were torn

from the Grecian empire.

Conflantine, called Copronymus, from *0790c " fler-cus," and *0002 " name," because he was said to have defiled the sacred font at his baptism, succeeded his father Leo in 741, and in 754 convened a council at Constantinople, regarded by the Greeks as the feventh cecumenical council, which folemnly condemned the worship and use of images. Those who, notwithstanding this decree of the council, raifed commotions in the flate, were feverely punished; and new laws were enacted, to fet bounds to the violence of monastic rage. Leo IV. who was declared emperor in 775, purfued the fame measures, and had recourse to the coercive influence of penal laws, in order to extirpate idolatry out of the Christian church. Irene, the wife of Leo, poisoned her husband in 780; assumed the reins of empire during the minority of her fon Constantine. and in 786 summoned a council at Nice in Bithynia, known by the name of the fecond Nicene council, which abrogated the laws and decrees against the new idolatry, restored the worship of images and of the cross, and denounced fevere punishments against those who maintained that God was the only object of religious adoration. In this contest, the Britons, Germans, and Gauls, were of opinion, that images might be lawfully continued in churches, but they confidered the worship of them as highly injurious and offensive to the Supreme Being. Charlemagne diftinguished himself as a mediator in this controversy: he ordered four books concerning images to be composed, refuting the reafons urged by the Nicene bishops to justify the worship of images, which he fent to Adrian the Roman pontiff in 790, in order to engage him to withdraw his approbation of the decrees of the last council of Nice. Adrian wrote an answer; and in 794, a council of 300 bishops, assembled by Charlemagne at Francfort on the Maine, confirmed the opinion contained in the four books, and folemnly condemned the worship of images. In the Greek church, after the banishment of Irene, the controverfy concerning images broke out anew, and was carried on by the contending parties, during the half of the ninth century, with various and uncertain fuccess. The emperor Nicephorus appears upon the whole to have been an enemy to this idolatrous worship. His successor, Michael Curopalates, furnamed Rhangabe, patronized and encouraged it. But the scene changed on the accession of Leo the Armenian to the empire; who affembled a council at Conflantinople in 814, that abolished the decrees of the Nicene council. His fuccessor Michael, furnamed Balbus, disapproved the worship of images, and his son Theophilus treated them with great feverity. However, the empress Theodora, after his death, and during the minority of her fon, affembled a council at Constantinople in 842, which reinstated the decrees of the fecond Nicene council, and encouraged image worship by a law. The council held at the same place under Photius, in 879, and reckoned by the Greeks the eighth general council, confirmed and renewed the Nicene decrees. In commemoration of this council, a feltival was inflituted by the superflitious Greeks, called the feast of orthodoxy. The Latins were generally

Toonogra of opinion, that images might be suffered as the means scribe it; and therefore have their height and bases scofandria dron-

of aiding the memory of the faithful, and of calling equal: wherefore the folidity of one of these pyramids to their remembrance the pious exploits and virtuous actions of the persons whom they represented; but they detelled all thoughts of paying them the leaft marks of religious homage or adoration. The council of Paris, affembled in 824 by Louis the Meek, refolved to allow the use of images in the churches, but feverely prohibited rendering them religious worship. Nevertheless, towards the conclusion of this century, the Gallican clergy began to pay a kind of religious homage to the images of faints, and their example was followed by the Germans and other nations. However, the iconoclasts still had their adherents among the Latins; the most eminent of whom was Claudius bishop of Turin, who, in 823, ordered all images, and even the cross, to be cast out of the churches, and committed to the flames; and he wrote a treatife, in which he declared both against the use and worship of them. He condemned relics, pilgrimages to the holy land, and all voyages to the tombs of faints; and to his writings and labours it was owing, that the city of Turin, and the adjacent country, was, for a long time after his death, much less insected with superstition than the other parts of Europe. The controverfy concerning the fanctity of images was again revived by Leo bishop of Chalcedon, in the 11th century, on occasion of the emperor Alexius's converting the figures of filver that adorned the portals of the churches into money in order to supply the exigencies of the flate. The bishop obstinately maintained that he had been guilty of facrilege; and published a treatife, in which he affirmed, that in thefe images there relided an inherent fanctity, and that the adoration of Chriflians ought not to be confined to the persons reprefented by these images, but extended to the images table. It was facred to Venus; and hence the epithemselves. The emperor affembled a council at Constantinople, which determined, that the images of Christ and of the faints were to be honoured only with a relative worship; and that invocation and worship ing to Bochart, denotes the place or spot facred to were to be addressed to the faints only as the servants the goddess. of Chrift, and on account of their relation to him, as their mafter. Leo, diffatisfied even with these absurd original perception or impression has been felt by and fuperstitious decisions, was fent into banishment. In the western church, the worship of images was difapproved and opposed by several confiderable parties. as the Petrobruffians, Albigenfes, Waldenfes, &c. till at length this idolatrous practice was entirely abolished in many parts of the Christian world by the Reforma-

tion. See IMAGE. ICONOGRAPHIA (derived from uxxy " image." and years " I describe), the description of images or ancient statues of marble and copper; also of busts and femi-bufts, penates, paintings in fresco, mosaic works,

and ancient pieces of miniature.

ICONOLATRAE, or ICONOLATERS (from 11X0V and AZTE:UD " I worthip,") or ICONODULI (from elkar and swass " I ferve);" those who worship images: A name which the iconoclattes give to those of the Romifh communion, on account of their adoring images, and of rendering to them the worship only due to God. See ICONOCLASTS and IMAGE.

ICOSAHEDRON, in geometry, a regular folid, consisting of 20 triangular pyramids, whose vertexes meet in the centre of a fphere supposed to circum-

Vol. IX. Part I.

multiplied by 20, the number of bases gives the solid

contents of the icofahedron. ICOSANDRIA (from '11x001 " twenty," and army " a man or husband"); the name of the 12th class in Linnœus's fexual method, confifting of plants with hermaphrodite flowers, which are furnished with 20 or more stamina, that are inserted into the inner fide of the calyx or petals. See BOTANY, p. 430

ICTINUS, a celebrated Greek architect who lived about 430 B. C. built feveral magnificent temples, and

among others that of Minerva at Athens.

IDA (anc. geog.), a mountain fituated in the heart of Crete where broadest; the highest of all in the island; round, and in compass 60 stadia (Strabo); the nurfing place of Jupiter, and where his tomb was vifited in Varro's time .- Another Ida, a mountain of Mysia, or rather a chain of mountains (Homer, Virgil), extending from Zeleia on the fouth of the territory of Cyzicus to Lectum the utmost promontory of The abundance of its waters became the Troas. fource of many rivers, and particularly of the Simois, Scamander, Æsepus, Granicus, &c. It was covered with green wood, and the elevation of its top opened a fine extensive view of the Hellespont and the adjacent countries; from which reason it was frequented by the gods during the Trojan war, according to Homer. The top was called Gargara (Homer, Strabo); and celebrated by the poets for the judgment of Paris on the beauty of the three goddesses, Minerva, Juno, and Venus, to the last of whom he gave the preference.

1DALIUM (anc. geog.), a promontory on the east fide of Cyprus. Now Capo di Griego; with a high rugged eminence rifing over it, in the form of a thet Idalia given her by the poets. The eminence was covered with a grove; and in the grove was a little town, in Pliny's time extinct. Idalia, accord-

IDEA, the reflex perception of objects, after the the mind. See METAPHYSICS, passim; and Logic,

IDENTITY, denotes that by which a thing is itfelf, and not any thing elfe; in which fense identity differs from similitude, as well as diversity. See META-PHYSICS.

IDES, in the ancient Roman kalendar, were eight days in each month; the first of which fell on the 15th of March, May, July, and October; and on the 13th day of the other months .- The origin of the word is contested. Some will have it formed from it to fee;" by reason the full moon was commonly seen on the days of the ides: others from is " species, figure," on account of the image of the full moon then vitible : others from idulium, or ovis idulis, a name given by the Hetrurians to a victim offered on that day to Jupiter: others from the Hetrurian word iduo, i. e. divido; by reason the ides divided the moon into two nearly equal parts.

The ides came between the KALENDS and the NONES; and were reckoned backwards. Thus they called the 14th day of March, May, July, and October, and the Blackft.

Idiocy. 12th of the other months, the pridie idus, or the day and now, by the vagrant acts, a method is charged Idiocy. the tertia idus; and so on, reckoning always backwards till they came to the Nones. This method of reckoning time is still retained in the chancery of Rome, and in the kalendar of the Breviary .- The ides of May were confecrated to Mercury: the ides of March were ever esteemed unhappy, after Cæsar's murder on that day: the time after the ides of June was reckoned fortunate for those who entered into matrimony: the ides of August were consecrated to Diana, and were observed as a feast day by the slaves. On the ides of September, auguries were taken for appointing the magistrates, who formerly entered into their offices

on the ides of May, afterwards on those of March.

IDIOCY, a defect of understanding. Both idiocy and Lunacy excuse from the guilt of crimes; (see CRIME, par. ult.) For the rule of law as to lunatics. which also may be easily adapted to idiots, is, that furiofus furore folum punitur. In criminal cases, therefore, idiots and lunatics are not chargeable for their own acts, if committed when under these incapacities: no, not even for treason itself. Also, if a man in his found memory commits a capital offence, and before arraignment for it he becomes mad, he ought not to be arraigned for it: because he is not able to plead to it with that advice and caution that he ought. And if, after he has pleaded, the prisoner becomes mad, he shall not be tried: for how can he make his defence? If, after he be tried and found guilty, he lofes his fenses before judgment, judgment shall not be pronounced; and if, after judgment, he becomes of nonfane memory, execution shall be stayed: for, peradventure, fays the humanity of the English law, had the prisoner been of found memory, he might have aldeed, in the bloody reign of Henry VIII, a flatute was made, which enacted, that if a person, being comshould suffer death, as if he were of perfect memory. But this favage and inhuman law was repealed by the flatute 1 & 2 Ph. & M. c. 10. For, as is observed by by a jury. And if he be fo found, a total idiocy, or tic hath lucid intervals of understanding, he shall anno deficiency. Yet, in the case of absolute madmen,

before the ides; the next preceding day they called out for imprisoning, chaining, and sending them to their proper homes.

The matrimonial contract likewife cannot take place in a flate of idiocy. It was formerly adjudged, that the iffue of an idiot was legitimate, and his marriage valid. A ftrange determination! fince confent is abfolutely requisite to matrimony, and neither idiots nor lunatics are capable of confenting to any thing. And therefore the civil law judged much more fenfibly, when it made fuch deprivations of reason a previous impediment, though not a cause of divorce if they happened after marriage. And modern refolutions have adhered to the fenfe of the civil law, by determining that the marriage of a lunatic, not being in a lucid interval, was absolutely void. But as it might be difficult to prove the exact flate of the party's mind at the actual celebration of the nuptials, upon this account (concurring with some private family reasons*), See Private Adt the statute 15 Geo. II. c. 30. has provided, that the vale Adt marriage of lunatics and persons under phrenzies (if c. 6. found lunatics under a commission, or committed to the care of truftees under any act of parliament) before they are declared of found mind by the lord chancellor, or the majority of fuch trustees, shall be totally void.

Idiots and persons of nonsane memory, as well as infants and persons under duress, are not totally disabled either to convey or purchase, but fub modo only. For their conveyances and purchases are voidable, but not actually void. The king, indeed, on behalf of an idiot, may avoid his grants or other acts. But it hath been faid, that a non compos himself, though he be afterwards brought to a right mind, shall not be permitted to allege his own infanity in order to avoid fuch grant: leged fomething in flay of judgment or execution. In- for that no man shall be allowed to stupify himself, or plead his own difability. The progress of this notion is fomewhat curious. In the time of Edward I. nonpos mentis, should commit high treason, and after fall compos was a sufficient plea to avoid a man's own into madness, he might be tried in his absence, and bond; and there is a writ in the register for the alienor himself to recover lands aliened by him during his infanity; dum fuit non compos mentis sua, ut dicit, &c. But under Edward III. a scruple began to arise, whe-Sir Edward Coke, "the execution of an offender is ther a man should be permitted to blemish himself, by for example, ut pana ad paucos, metus ad omnes per- pleading his own infanity: and, afterwards, a defenveniat: but so it is not when a madman is executed; dant in affize having pleaded a release by the plaintiff but should be a miserable spectacle, both against law, since the last continuance, to which the plaintiff reand of extreme inhumanity and cruelty, and can be plied (ore tenus, as the manner then was) that he was no example to others." But if there be any doubt out of his mind when he gave it, the court adjourned whether the party be compos or not, this shall be tried the affize; doubting, whether as the plaintiff was fane both then and at the commencement of the fuit, he absolute infanity, excuses from the guilt, and of course should be permitted to plead an intermediate deprivafrom the punishment, of any criminal action committion of reason; and the question was asked, how he ted under such deprivation of the senses: but if a luna- came to remember to release, if out of his senses when he gave it? Under Henry VI. this way of reasoning . fwer for what he does in those intervals, as if he had (that a man shall not be allowed to disable himself, by pleading his own incapacity, because he cannot know: as they are not answerable for their actions, they should what he did under such a situation) was seriously adopnot be permitted the liberty of acting unless under pro- ted by the judges in argument; upon a question, wheper control; and, in particular, they ought not to be ther the heir was barred of his right of entry by the fuffered to go loofe, to the terror of the king's fub- feoffment of his infane ancestor? And from these loofe jects. It was the doctrine of our ancient law, that per- authorities, which Fitzherbert does not scruple to reions deprived of their reason might be confined till they ject as being contrary to reason, the maxim that a man recovered their senses, without waiting for the forms of shall not stultify himself, hath been handed down as a commission or other special authority from the crown: fettled law; though later opinions, feeling the incomIsiom venience of the rule, have in many points endeavoured to restrain it. And, clearly, the next heir, or other person interested, may, after the death of the idiot or non compos, take advantage of his incapacity and avoid the grant. And fo too, if he purchases under this disability, and does not afterwards upon recovering his fenses agree to the purchase, his heir may either waive or accept the effate at his option. In like manner, an infant may waive fuch purchase or conveyance, when he comes to full age; or, if he does not then actually agree to it, his heirs may waive it after him. Persons alfo, who purchase or convey under duress, may affirm or avoid fuch transaction, whenever the duress is ceafed. For all these are under the protection of the law: which will not fuffer them to be imposed upon through the imbecility of their prefent condition; fo that their acts are only binding, in cafe they be afterwards agreed to when fuch imbecility ceases. Yet the guardians or committees of a lunatic, by the statute 11 Geo. III. c. 20. are empowered to renew in his right, under the directions of the court of chancery, any leafe for lives or years, and apply the profits of fuch renewal for the benefit of fuch lunatic, his heirs, or executors. See I.UNACY.

> IDIOM, among grammarians, properly fignifies the peculiar genius of each language, but is often used in a fynonymous fense with dialect. The word is Greek, Istora " propriety;" formed of istos " proper, own."

> IDIOPATHY, in physic, a diforder peculiar to a certain part of the body, and not arising fom any preceding difease; in which sense it is opposed to sympathy. Thus, an epilepfy is idiopathic when it happens merely through fome fault in the brain; and fympathetic when it is the confequence of fome other diforder.

IDIOSYNCRASY, among physicians, denotes a peculiar temperament of body, whereby it is rendered more liable to certain diforders than perfons of a different conftitution usually are.

IDIOT, or IDEOT, in our laws, denotes a natural fool, or a fool from his birth. See IDIOCY.

The word is originally Greek, is wirns, which primarily imports a private person, or one who leads a private life, without any share or concern in the government of affairs.

A person who has understanding enough to measure a yard of cloth, number twenty rightly, and tell the days of the week, &c. is not an idiot in the eye of the law. But a man who is born deaf, dumb, and blind, is confidered by the law in the fame flate as an idiot.

IDIOT is also used, by ancient writers, for a person ignorant or unlearned; answering to illiteratus or imperitus. In this fenfe, Victor tells us, in his Chronicon, that in the confulfhip of Messala, the Holy Gospels, by command of the emperor Anastasius, were corrected and amended, as having been written by idiot evangelists: Tanquam ab idiotis evangelistis composita.

IDLENESS, a reluctancy in people to be employ-

ed in any kind of work.

Idleness in any person whatsoever is a high offence against the public economy. In China it is a maxim, that if there be a man who does not work, or a woman that is idle, in the empire, fomebody must

fuffer cold or hunger: the produce of the lands not being more than fufficient, with culture, to maintain the Idoletry. inhabitants; and therefore, though the idle person may shift off the want from himself, yet it must in the end fall fomewhere. The court also of Areopagus at Athens punished idleness, and exerted a right of examining every citizen in what manner he fpent his time; the intention of which was, that the Athenians, knowing they were to give an account of their occupations. should follow only such as were laudable, and that there might be no room left for fuch as lived by unlawful arts. The civil law expelled all flurdy vagrants from the city: and, in our own law, all idle perfons or vagabonds, whom our ancient flatutes describe to be " fuch as wake on the night, and fleep on the day, Blackft. and haunt customable taverns and ale-houses, and routs Comment. about; and no man wot from whence they come, ne whether they go;" or fuch as are more particularly described by statute 17 Geo. II. c. 5. and divided into three classes, idle and diforderly persons, rogues and vagabonds, and incorrigible rogues ;- all these are offenders against the good order, and blemishes in the government, of any kingdom. They are therefore all punished, by the statute last mentioned; that is to fay, idle and diforderly perfons with one month's imprisonment in the house of correction; rogues and vagabonds with whipping, and imprisonment not exceeding fix months; and incorrigible rogues with the like discipline, and confinement not exceeding two years: the breach and escape from which confinement in one of an inferior class, ranks him among incorrigible rogues; and in a rogue (before incorrigible) makes him a felon, and liable to be transported for seven years. Perfons harbouring vagrants are liable to a fine of forty shillings, and to pay all expences brought upon the parish thereby ; in the same manner as, by our ancient laws, whoever harboured any stranger for more than two nights, was answerable to the public

for any offence that fuch his inmate might commit. IDOL, in pagan theology, an image, or fancied representation of any of the heathen gods .- This image, of whatever materials it confifted, was, by certain ceremonies, called confecration, converted into a god. While under the artificer's hands, it was only a mere statue. Three things were necessary to turn it into a god; proper ornaments, confecration, and oration. The ornaments were various, and wholly defigned to blind the eyes of the ignorant and flupid multitude, who are chiefly taken with show and pageantry. Then followed the confecration and oration, which were performed with great folemnity among the Ro-

mans. See IMAGE.

IDOLATRY, or the worship of idols, may be diflinguished into two forts. By the first, men adore the works of God, the fun, the moon, the stars, angels, dæmons, men, and animals: by the fecond, men worship the work of their own hands, as statues, pictures, and the like; and to these may be added a third, that by which men have worshipped the true God under fenfible figures and reprefentations. This indeed may have been the case with respect to each of the above kinds of idolatry; and thus the Ifraelites adored God under the figure of a calf.

The stars were the first objects of idolatrous worship, on account of their beauty, their influence on

Idolatry, the productions of the earth, and the regularity of the Greeks to the Troian war with a fleet of oo flips. Idumas Idomeneus, their motions, particularly the fun and moon, which are confidered as the most glorious and resplendent images of the Deity : afterwards, as their fentiments became more corrupted, they began to form images, and to entertain the opinion, that by virtue of confecration, the gods were called down to inhabit or dwell in their statues. Hence Arnobius takes occasion to rally the pagans for guarding fo carefully the statues of their gods, who, if they were really prefent in their images, might fave their worshippers the trouble of securing them from thieves and robbers.

As to the adoration which the ancient pagans paid to the statues of their gods, it is certain, that the wifer and more fenfible heathens confidered them only as fimple representations or figures defigned to recal to their minds the memory of their gods. This was the opinion of Varro and Seneca: and the fame fentiment is clearly laid down in Plato, who maintains, that images are inanimate, and that all the honour paid to them has respect to the gods whom they represent. But as to the vulgar, they were flupid enough to believe the statues themselves to be gods, and to pay divine worship to stocks and stones.

Soon after the flood, idolatry feems to have been the prevailing religion of all the world; for wherever we cast our eyes at the time of Abraham, we scarcely fee any thing but false worship and idolatry. And it appears from Scripture, that Abraham's forefathers, and even Abraham himfelf, were for a time idolaters.

The Hebrews were indeed expressly forbidden to make any reprefentation of God; they were not fo much as to look upon an idol : and from the time of the Maccabees to the destruction of Jerusalem, the Iews extended this precept to the making the figure of any man : by the law of Mofes, they were obliged to destroy all the images they found, and were forbidden to apply any of the gold or filver to their own ufe, that no one might receive the least profit from any thing belonging to an idol. Of this the Icws. after they had imarted for their idolatry, were fo fenfible, that they thought it unlawful to use any veffel that had been employed in facrificing to a falle god, to warm themselves with the wood of a grove after it was cut down, or to shelter themselves under its shade.

But the preaching of the Christian religion, whereever it prevailed, entirely rooted out idolatry; as did also that of Mahomet, which is built on the worship of one God. It must not, however, be forgotten, that the Protestant Christians charge those of the church of Rome with paying an idolatrous kind of worship to the pictures or images of faints and martyrs : before these, they burn lamps and wax-candles; before these, they burn incense, and, kneeling, offer up their vows and petitions : they, like the Pagans, believe that the faint to whom the image is dedicated, prefides in a particular manner about its shrine, and works miracles by the intervention of its image; and that if the image was destroyed or taken away, the faint would no longer perform any miracle in that

IDOMENEUS (fab. hift.), succeeded his father Deucalion on the throne of Crete. He accompanied

During this celebrated war he rendered himself famous by his valour, and flaughtered many of the enemy. At Jedburgh. his return from the Trojan war, he made a vow to Neptune in a dangerous tempest, that if he escaped from the fury of the leas and storms, he would offer to the god whatever living creature first presented itfelf to his eye on the Cretan shore. This was no other than his fon, who came to congratulate his father upon his fafe return. Idomeneus performed his promife to the god; and the inhumanity and rashness of this facrifice rendered him fo odious in the eyes of his fubjects, that he left Crete, and migrated in quest of a fettlement. He came to Italy and founded a city on the coast of Calabria, which he called Salentum. He died in an extreme old age, after he had had the fatisfaction of feeing his new kingdom flourish, and his fubiects happy. According to the Greek scholiast of Lycophron, v. 1217, Idomenens, during his absence in the Trojan war, entrufted the management of his kingdom to Leucos, to whom he promifed his daughter Clifithere in marriage at his return. Leucos at first governed with moderation, but he was perfuaded by Nauplius king of Eubera to put to death Meda the wife of his malter, with her daughter Clifithere, and to feize the kingdom. After these violent measures he firengthened himself on the throne of Crete, and Idomeneus at his return found it impossible to expel the ufurper.

IDUMÆA. See EDOM.

JEALOUSY, in ethics, is that peculiar uneafiness which arises from the fear that some rival may rob us of the affection of one whom we greatly love, or fufpicion that he has already done it. The first fort of jealoufy is inseparable from love, before it is in possesfion of its object : the latter is often unjust, generally mischievous, always troublesome.

Waters of FEALOUSY. See WATERS.

IDYLLION, in ancient poetry, is only a diminutive of the word EIDOS, and properly fignifies any poem of moderate extent, without confidering the fubiect, But as the collection of Theocritus's poems were called idvllia, and the pastoral pieces being by far the best in that collection, the term idyllion feems to be now appropriated to paftoral pieces.

JEARS or GEERS, in the fea-language, an affemblage of tackles, by which the lower yards of a ship are hoisted along the mast to their usual station, or lowered from thence as occasion requires; the former of which operations is called fwaying, and the latter

IEBUSÆI, one of the feven ancient people of Camaan, descendents of Jebusi, Canaan's son; so warlike and brave, as to have flood their ground, especially in Jebus, afterwards called Jerufalem, down to the time of David. Judges i. 21. 1 Sam. v. 6.

JEDBURGH, a parliament-town of Scotland, capital of Tiviotdale or Roxburghshire, is fituated nearly in the middle of the county, on the banks of the river Fed, whence it derives its name. It is well built and populous, and has a good market for corn and cattle. On the west side of the river, near its junction with the Teviot, fland the beautiful ruins of an abbey founded by David I. a part of which ancient pile ftill

ferves for a parish-church.—Jedburgh is the seat of the sheriff's court and presbytery; and is a barony in the family of Lothian, whose eldest son is called Earl of Ancrem.

IEDDO, the capital town or city of the islands of Japan, where the emperor refides. It is open on all fides, having neither walls nor ramparts; and the houses are built with earth, and boarded on the outfide to prevent the rain from destroying the walls. In every freet there is an iron gate, which is that up in the night; and a kind of cuttom house or magazine, to put merchandizes in. It is a large place, being nine miles in length and fix in breadth, and contains 1,000,000 of inhabitants. A fire happened in 1658, which, in the frace of 48 hours, burnt down 100,000 houses, and in which a vast number of inhabitants perifhed. The emperor's palace and all the reft were reduced to ashes: but they are all rebuilt again. The royal palace is in the middle of the town; and is defended with walls, ditches, towers, and baltions. Where the emperor refides, there are three towers nine stories high, each covered with plates of gold; and the hall of audience is faid to be supported by pillars of maffy gold. Near the palace are feveral others, where the relations of the emperor live. The empress has a palace of her own, and there are 20 fmall ones for the concubines. Besides, all the vasfal kings have each a palace in the city, with a handsome garden, and flables for 2000 horses. The houses of the common fort are nothing but a ground floor, and the rooms are parted by folding fcreens; so that they can make the rooms larger or fmaller at pleasure. It is feated in an agreeable plain, at the bottom of a fine bay; and the river which croffes it, is divided into feve-

ral canals. E. Long. 140. o. N. Lat. 35. 32. IEFFERY. See Geoffrey.

EFFREYS (Sir George), baron Wem, commonly salled Judge Jeffreys, was the fixth fon of John Jef-freys, Efq; of Acton in Denbighshire; and was educated at Westminster-school, whence he removed to the Inner Temple, where he applied himself to the fludy of the law. Alderman Jeffreys, who was probably related to him, introduced him among the citizens of London; and he being a merry bottle companion, foon came into great business, and was chosen their recorder. He was afterwards chosen folicitor to the duke of York; and in 1680 was knighted, and made chief-justice of Chester. At length, refigning the recordership, he obtained the post of chief justice of the king's-bench, and, foon after the accession of James II. the great feal. During the reign of king Charles II. he showed himself a bitter enemy to those diffenting ministers who, in that time of persecution, were tried by him: he was one of the greatest advisers and promoters of all the oppressions and arbitrary measures carried on in the reign of James II.; and his fanguinary and inhuman proceedings against Monmouth's unhappy adherents in the west will ever render his name infamous. Whenever the prisoner was of a different party, or he could pleafe the court by condemning him. instead of appearing according to the duty of his office, as his counfel, he would fcarce allow him to fpeak for himself; but would load him with the groffest and most vulgar abuse, browbeat, infult, and turn to ridicule the witnesses that spoke in his behalf; and even

threaten the jury with fines and imprisonment, if they Jeffreys, made the leaft hefitation about bringing in the prifoner, guilty. Yet it is faid, that when he was in temper, and matters perfectly indifferent came before him, no one became a feat of justice better. Nay, it even appears, that, when he was under no flate-influence, he was fometimes inclined to protect the natural and civil rights of mankind, of which the following instance has been given :- The mayor and aldermen of Briftol had been used to transport convicted criminals to the American plantations, and fell them by way of trade. This turning to good account, when any pilferers or petty rogues were brought before them, they threatened them with hanging; and then fome officers who attended, earneftly perfuaded the ignorant intimidated creatures to beg for transportation, as the only way to fave them; and in general their advice was followed. Then, without more form, each alderman in course took one, and fold him for his own benefit; and fometimes warm disputes arose between them about the next turu. This infamous trade, which had been carried on many years, coming to the knowledge of the lord chief justice, he made the mayor descend from the bench, and fland at the bar in his scarlet and furr, with his guilty brethren the aldermen, and plead as common criminals. He then obliged them to give fecurities to answer informations; but the proceedings were stopped by the Revolution .- However, the brutality Jeffreys commonly showed on the bench, where his voice and vifage were equally terrible, at length exposed him to a severe mortification. A scrivener of Wapping having a cause before him, one of the opponent's counsel faid he was a strange fellow, and sometimes went to church, and fometimes to conventicles a and it was thought he was a trimmer. At this the chancellor fired: "A trimmer? (faid he); I have heard much of that monster, but never faw one. Come forth, Mr 'Trimmer, and let me see your shape." He then treated the poor fellow fo roughly, that, on his leaving the hall, he declared he would not undergo the terrors of that man's face again to fave his life, and he should certainly retain the frightful impressions of it as long as he lived. Soon after, the prince of Orange coming, the lord chancellor, dreading the public refentment, disguised himself in a seaman's dress, in order to leave the kingdom; and was drinking in a cellar, when this scrivener coming into the cellar, and seeing again the face which had filled him with fuch horror, started; on which Jeffreys, fearing he was known, feigned a cough, and turned to the wall with his pot of beer in his hand. But Mr Trimmer going out, gave notice that he was there; and the mob rushing in, feized him, and carried him before the lord mayor, who fent him with a strong guard to the lords of the council, by whom he was committed to the Tower, where he died in 1689 .- It is remarkable, that the late coun-

pulace on the weltern road, only because she was granddaughter of the inhuman Jestreys.

JEHOVAH, one of the scripture names of God, fignifying the Being who is felf-existent and gives existence to others.

tels of Pomfret met with very rude infults from the po-

So great a veneration had the Jews for this name, that they left off the custom of pronouncing it, where-by its true pronunciation was forgotten. They call it:

100

Iclune tetragrammaton, or "the name with four letters; and Corp., butchers meat, and wild fowls, are very cheap, Jencoping believe, that whoever knows the true pronunciation of E. Long. 86. 25. N. Lat. 58. 40. Jeniskoi. it cannot fail to be heard by God.

JEJUNUM, the second of the small guts; thus ter, with a strong citadel. The houses are all built with called from the Latin jejunus, " hungry;" because always found empty. See ANATOMY, no 93.

IELLALEAN, or GELALEAN Calendar, epocha,

and year. See CALENDAR, EPOCHA, and YEAR.

JELLY, a form of food, or medicine, prepared from the juices of ripe fruits, boiled to a proper confiftence with fugar, or the ftrong decoctions of the horns, bones, or extremities of animals, boiled to fuch a height as to be stiff and firm when cold, without the addition of any fugar. - The jellies of fruits are cooling, faponaceous, and acefcent, and therefore are good as medicines in all diforders of the primæ viæ, arifing from alkalescent juices, especially when not given alone, but diluted with water. On the contrary, the jellies made from animal substances are all alkalescent, and are therefore good in all cases in which an acidity of the humours prevails: the alkalescent quality of these is, however, in a great measure taken off, by the adding lemon juice and fugar to them. There were formerly a fort of jellies much in use, called compound jellies; these had the restorative medicinal drugs added to them, but they are now scarce ever heard of.

FRLLY-Oat, a preparation of common oats, recommended by many of the German physicians in all hectic diforders, to be taken with broth of fnails or crayfish .- It is made by boiling a large quantity of oats, with the hulk taken off, with fome hartshorn shavings, and currants together, with a leg of veal cut to pieces. and with the bones all broken; these are to be set over the fire with a large quantity of water, till the whole is reduced to a fort of jelly; which when strained and cold will be very firm and hard. A few spoonfuls of this are to be taken every morning, diluted with a bason of either of the above-mentioned broths, or any other

warm liquor.

JEMPTERLAND, a province of Sweden, bounded on the north by Angermania, on the east by Medalpadia, on the fouth by Helfingia, and on the west by Norway. It is full of mountains; and the principal towns are Reffundt, Lich, and Docra.

JENA, a strong town of Germany, in the circle of Upper Saxony, and in Thuringia, with an univerfity. It is feated on the river Sala, in E. Long. 2. 50. N.

JENCAPORE, a town of Afia, in Indostan, and in the dominions of the Great Mogul, capital of a territory of the same name. It is seated on the river Chaul, in E. Long. 76. 25. N. Lat. 30. 30. JENISA, a river of the Russian empire, that runs

from north to fouth through Siberia, and falls into the

Frozen Ocean.

IENISKOI, a town of the Ruffian empire, in Siberia, seated on the river Jenisa. It is large, populous, and pretty flrong; and there are villages for feveral miles round it. It is subject to the Tungusians, who are pagans, and chiefly live on the above river. They pay a tribute to the emperor for every bow, reckoning a man and a woman for one. The climate is extremely cold; and no other fruits grow there but black and red currants, frawberries, and goofeberries.

JENCOPING, a town of Sweden, in the province. Jeofaile

of Smaland, feated on the fouth fide of the lake Wer-

wood. E. Long. 14. 20. N. Lat. 57. 22.

JENKIN (Robert), a learned English divine in the 18th century, was bred at Cambridge, became mafter of St John's college, and wrote feveral books much esteemed, viz. 1. An historical examination of the authority of General Councils, 4to. 2. The reasonableness and certainty of the Christian religion, 2 vols 8vo. 3. Defensio S. Augustini. This book is written against M. Le Clerc. 4. Remarks on some books lately published, viz. Mr Whiston's eight sermons, Locke's paraphrase, &c. 5. A translation from the French of the life of Apollonius Tyaneus.

JENKINS (Henry). See Longevity.

JENKINS (Sir Leoline), a learned civilian and able flatesman of the last century, born in Glamorganshire about the year 1623. Being rendered obnoxious to the parliament during the civil war by adhering to the king's cause, he consulted his safety by flight; but returning on the restoration, he was admitted an advocate in the court of arches, and fucceeded Dr Exton as judge. When the queen-mother Henrietta died in 1669 at Paris, her whole estate, real and personal, was claimed by her nephew Louis XIV. : upon which Dr Jenkins's opinion being called for and approved, he went to Paris, with three others joined with him in a commission, and recovered her effects; for which he received the honour of knighthood. He officiated as one of the mediators at the treaty of Nimeguen, in which tedious negociation he was engaged about four years and a half; and was afterwards made a privy counsellor and secretary of state. He died in 1685; and as he never married, bequeathed his whole effate to charitable uses: he was so great a benefactor to Jefus-college Oxford, that he is generally looked on as the fecond founder. All his letters and papers were collected and printed in 1724, in 2 vols folio.

JENNY WREN, a name given by writers on fonga birds to the wren. See WREN.

IENTACULUM was, amongst the Romans, a morning refreshment like our breakfast. It was exceedingly fimple, confifting, for the most part, of bread alone; labouring people indeed had fomething more substantial to enable them to support the fatigues

of their employment. What has been here faid may be observed of the Jews and Grecians also. The Greeks diftinguished this morning-meal by the several names of apisov, axpalionos or axpaliona, though apisov is generally applied to dinner. See EATING and DINNER.

JEOFAILE, (compounded of three French words, J'ay faille, " I have failed"), a term in law, used for an overlight in pleading or other proceedings at law.

The showing of these defects or overlights was formerly often practifed by the counsel; and when the jury came into court in order to try the iffue, they faid, This inquest you ought not to take; and after verdict they would fay to the court, To judgment you ought not to go. But feveral flatutes have been made to avoid the delays occasioned by such suggestions; and a judgment is not to be flayed after verdict for millaking the Christian or surname of either of the parties, or

JEPHTHAH, judge of Ifrael, and fucceffor to Jair in the government of the people, was a native of Mifpeh, and the fon of one Gilead by a harlot. This Gilead having married a lawful wife, and had children by her, these children drove Jephthah from his father's house, saying, that he should not be heir with them. Jephthah retired into the land of Tob, and there he became captain of a band of thieves and fuch other people as he had picked up together. At that time, the Ifraelites beyond Jordan, feeing themselves pressed by the Ammonites, came to defire affiltance from Jephthah; and that he would take upon him the command of them. Jephthah at first reproached them with the injustice which they had done him, or at least which they had not prevented, when he was forced from his father's house. But as these people were very earnest in their request, he told them, that he would fuccour them, provided that at the end of the war they would acknowledge him for their prince. This they confented

to, and promifed with an oath. Jephthah, in the year of the world 2817, having been acknowledged prince of the Ifraelites in an affembly of the people, was filled with the spirit of God, and began to get his troops together; to that end, he went over all the land which the children of Ifrael poffeffed beyond Jordan. At the fame time he made a vow to the Lord, that if he were fuccessful against the Ammonites, he would offer up for a burnt-offering whatever should first come out of his house to meet him. The battle being fought, Jephthah remained conqueror, and ravaged all the land of Ammon. But as he returned to his house, his only daughter came out to meet him with timbrels and with dances; whereupon Jephthah tore his clothes, and faid, " Alas, my daughter, thou haft brought me very low: for I have made a vow unto the Lord, and cannot fail in the performance of it." His daughter answered, " My father, if thou haft made a vow unto the Lord, do with me as thou hast promifed; grant me only the favour that I may be at liberty to go up to the mountains, and there for two months bewail my virginity with my companions." Jephthah granted her this liberty; and at the end of two months, he offered up his daughter, who died a virgin, a burnt-offering, agreeable to his vow, according to the opinion of most commentators. In the mean time, the Ephraimites, jealous of the victory obtained by Jephthah over the Ammonites, passed the river Jordan in a tumultuous manner, came and complained to Jephthah that he had not invited them to this war, and threatened to fet fire to his house. Jephthah answered them, that he had fent to defire their affistance; but observing that they did not come, he put his life in his hands and hazarded a battle. The Ephraimites not being fatisfied with these reasons, Jephthah affembled the people of Gilead, gave them battle, and defeated them; fo that there were two and forty thousand men of the tribe of Ephraim killed that day. We know nothing more in particular concerning the life of Jephthah, only that he judged Ifrael fix years, and was buried in a city of Gilead.

St Paul (Heb. xi. 32.) places Jephthah among the faints of the Old Testament, the merit of whose faith diflinguished them. But it must be observed, that there is

fomething to extraordinary in Jephthah's vow, that Jerboa, notwithstanding the scripture speaks of it in very plain Jeremiah. and clear terms, yet fuch difficulties arife concerning it as perplex the commentators. Some maintain, that this daughter of Jephthah was not facrificed, as that would have been a violation of the law of Mofes; and especially, when by the same law he might have redeemed his daughter for ten shekels of filver: therefore they contend, that it was fomething elfe Jephthah did to his daughter, fuch as devoting her to a state of celibacy, or dedicating her to the fervice of God .- On the other hand, those who maintain the affirmative, or that Jephthah's daughter was actually facrificed, urge, that the times wherein Jephthah lived were fadly addicted to idolatry; also the manner wherein he lived before he was called to the affistance of his country; but above all, the clear, evident, and express meaning of the text. They observe, that vows of perpetual virginity are institutions of a modern date; and had there been no more in it, there would have been little occasion for rending his clothes, and bemoaning himself as he did: besides the bitter lamentations made by herfelf, and by all the daughters of Ifrael in fucceeding times. But if fhe was facrificed, we may fafely and confidently aver with Josephus, who fays that she was, that this facrifice was neither lawful nor acceptable to God: but, on the contrary, an aboninable crime, that might, notwithstanding, have proceeded from a mistaken principle of religion.

IERBOA. See Mus.

IEREMIAH (the Prophecy of), a canonical book of the Old Testament. This divine writer was of the race of the priefts, the fon of Hilkia of Anathoth, of the tribe of Benjamin. He was called to the prophetic office when very young, about the 13th year of Joliah. and continued in the discharge of it about 40 years. He was not carried captive to Babylon with the other Jews, but remained in Judea to lament the defolation of his country. He was afterwards a prisoner in Egypt with his disciple Baruch, where it is supposed he died in a very advanced age. Some of the Christian fathers tell us he was stoned to death by the Jews, for preaching against their idolatry; and some say he was put to death by Pharaoh Hophrah, because of his prophecy against him. Part of the prophecy of Jeremiah relates to the time after the captivity of Ifrael, and before that of Judah, from the first chapter to the 44th; and part of it was in the time of the latter captivity, from the 44th chapter to the end. The prophet lavs open the fins of Judah with great freedom and boldness, and reminds them of the severe judgments which had befallen the ten tribes for the fame offences. He passionately laments their misfortune, and recommends a speedy reformation to them. Afterwards he predicts the grievous calamities that were approaching, particularly the 70 years captivity in Chaldea. He likewife foretels their deliverance and happy return, and the recompence which Babylon, Moab, and other enemies of the Jews, should meet with in due time. There are likewise several intimations in this prophecy concerning the kingdom of the Messiah; also several remarkable visions, and types, and historical passages relating to those times. The 52d chapter does not belong to the prophecy of Jeremiah, which probably was added by Ezra, and contains a narrative of the taJeritho king of Jerufakem, and of what happened during the captivity of the Jews, to the death of Jechonias. St Jerom has observed upon this prophet, that his flyle is more easly than that of Haish and Hosea; that he retains fomething of the rufficity of the village where he was born; but that he is very learned and majetite, and equal to those two prophets in the fense of his

prophecy.

TERICHO, or HIFRICHUS (anc. geog.), a city of Tudea: fituated between Jordan and Jerufalem, at the distance of 150 stadia from the latter, and 60 from the former. Josephus fays, " the whole space from Jerufalem is defart and rocky, and equally barren and uncultivated from Jericho to the lake Afphaltites; yet the places near the town and above it are extremely fertile and delicious, fo that it may be juftly called a divine plain, surpassing the rest of the land of Canaan, no unfruitful country, and furrounded by hills in the manner of an amphitheatre. It produces opobalfamum myrobalans, and dates; from the fall of which it is called the city of palm-trees, by Mofes. The place is now called Raha; and is fituated, M. Volney informs us, "in a plain fix or feven leagues long, by three wide, around which are a number of barren mountains, that render it extremely hot. Here formerly was cultivated the balm of Mecca. From the deferintion of the Hadjes, this is a shrub similar to the pomegranate-tree, with leaves like those of rue: it bears a pulpy nut, in which is contained a kernel that yields the refinous juice we call balm or balfam. At present there is not a plant of it remaining at Raha; but another species is to be found there, called Zak-koun, which produce a sweet oil, also celebrated for healing wounds. This zakkoun refembles a plum-

then a nut, the kernel of which gives an oil that the Arubs fell very dear: this is the fole commerce of Raha, which is no more than a ruinous village.

TERIMOTH. See JARIMUTH.**

tree; it has thorns four inches long, with leaves like

those of the olive-tree, but narrower and greener, and

prickly at the end; its fruit is a kind of acorn, with-

out a calyx, under the bark of which is a pulp, and

JEROME (St), in Latin Hieronymus, a famous doctor of the church, and the most learned of all the Latin fathers, was the for of Eusebius; and was born at Stridon, a city of the ancient Pannonia, about the year 340. He studied at Rome under Donatus, the learned grammarian. After having received baptifm, he went into Gaul, and there transcribed St Hilary's book de Synodis. He then went into Aquileia, where he contracted a friendship with Heliodorus, who prevailed on him to travel with him into Thrace, Pontus, Bithynia, Galatia, and Cappadocia. In 372 St Jerome retired into a defart in Syria, where he was perfecuted by the orthodox of Melitius's party, for being a Sabellian, because he made use of the word Hypoflafis, which had been used by the council of Rome in 369. This obliged him to go to Jerusalem; where he applied himfelf to the fludy of the Hebrew language, in order to receive a more perfect knowledge of the Holy Scriptures; and about this time he confented to be ordained, on condition that he should not be confined to any particular church. In 381, he went to Constantinople to hear St Gregory of Nazianzen; and the following year returned to Rome, where he was Nº 163.

made fecretary to pope Damasus. He then instructed many Roman ladies in piety and the knowledge of the sciences, which exposed him to the calumnies of those whom he zealously reproved for their irregularities; and Pope Siricius not having all the efteem for him which his learning and virtue justly intitled him to, this learned doctor left Rome, and returned to the monastery of Bethlehem, where he employed himfelf in writing against those whom he called heretics, especially against Vigilantius and Jovinian. He had a quarrel with John of Jerufalem and Rufinus about the Origenists. He was the first who wrote against Pelagius; and died on the 30th of September 420, at about 80 years of age. There have been feveral editions of his works; the laft, which is that of Verona, is in 11 vols folio. His principal works are, I. A Latin version of the Holy Scriptures, diftinguished by the name of the Vulgate. 2. Commentaries on the Prophets, Ecclefiastes, St Matthew's Gofpel, and the Epiftle to the Galatians, Ephelians, Titus, and Philemon. 3. Polemical treatifes against Montanus, Helvidius, Jovinian, Vigilantius, and Pelagius. 4. Several letters. 5. A treatife on the lives and writings of the ecclefiastical authors who had flourished before his time .- St Jerome's ftyle is, lively and animated, and fometimes fublime.

TEROME of Progue, fo called from the place of his birth, in Bohemia. He was neither a monk nor clergyman, but had a learned education. Having embraced the opinions of John Hufs, he began to propagate them in the year 1480. In the mean time the council of Nice kept a watchful eye over him, and confidering him as a dangerous person, cited him to appear before them and give an account of his faith. In obedience to this citation, he went to Constance; but on his arrival, in 1415, finding Huss in prison, he fet out for his own country. Being feized however on the way, imprisoned, and examined, he was so intimidated, that he retracted, and pretended to approve of the condemnation of Wickliff's and Hufs's opinions; but on the 26th of May 1416, he condemned that recantation in these terms: "I am not ashamed to confess here publicly my weakness. Yes, with horror I confess my base cowardice. It was only the dread of the punishment by fire which drew me to confent. against my confcience, to the condemnation of the doc-trine of Wickliff and Huss." Accordingly sentence was paffed on him; in pursuance of which he was delivered to the fecular arm, and burnt in 1416. He was

a person of great parts, learning, and elocution. JERONYMITES, or HIERONYMITES, a denomination given to divers orders or congregations of religious; otherwise called Hermits of St Jerom.

JERSEY, an island in the English channel, believed to be the island called in the Linerary Cofarca, in fucceeding times Angua, by us Carfey, more frequently Ferfey. It is fituated in the English channel, 18 miles to the welt of Normandy, and 84 to the fouth of Portland in Dorfetshire, and in the time of the Romans was called Cofarca. It is not above 12 miles in length, nor much above 6 where broadels, which is at the two extremities. It is defended by rocks and dangerous quickfands. On the north fide the cliffs rife 40 or 30 fathoms high, which render it inacceffible on that fide; but on the fouth the floor is almost level with the water. In the well part of the island.

J E R

Jerley.

island is a large tract of land once cultivated and very fertile, but now a barren defax, caufed by the westerly winds throwing up fand from the bottom to the top of the highest cliffs. The higher lands are diversified by gritty, gravelly, flony, and fine mould; the lower by a deep, rich, and heavy foil. The middle part of the island is somewhat mountainous, and so thick planted with trees, that at a distance it resembles one entire fored, though in walking through it there is hardly a thicket or any other thing to be feen but hedge-rows and orehards of apple-trees. The valleys under the hills are finely watered by brooks, and have plenty of cattle and fmall sheep, with very fine wool, and very sweet meat, which is ascribed to the shortness of the grass. The horses are good for draught; but few fit for the faddle. The island produces variety of trees, roots, and herbs; but not corn enough for the inhabitants, who therefore fend for it to England and France, and fometimes to Dantzic. The fields are inclosed by great mounds of earth, raised from 6 to 8 or 10 feet high, proportionably thick and folid, planted with quickfets and trees. As the air of this island is very healthy, those of the inhabitants who are temperate live to a great age : but the coast is very subject to ftorms by westerly wind, from which they have no land to shelter them nearer than North America : and there is a vast chain of rocks about the island, among which the tides and currents are fo ftrong and rapid, that the navigation is dangerous to those who are not perfectly acquainted with the coast. The buildings of this ifland are generally of rag-stone; but fome of the wealthy inhabitants have their houses fronted with a reddish white stone, capable of being polished like marble, and of which there is a rich quarry on a hill called Montmado. The ordinary dwellings are thatched. The churches are very plain buildings, most of them with square steeples; and the communion table is not at the east end, as in the English churches, but placed just under the pulpit. flaple manufacture is knit stockings and caps, many thousand pair of which are weekly fold at St Helier to the merchants; also cyder, of which 25,000 hogsheads have been made here in one year. Their principal foreign trade is to Newfoundland; whither, particularly in 1732, they fent 24 thips; thefe proceed from thence to the Mediterranean to dispose of their fish.

On the fouth of the island the sea frems to have encroached upon the land (which, as we have before obferved, declines on that fide), and to have swallowed upwards of fix fquare miles, making a very beautiful bay of about three miles broad, and near the fame in depth. In the east corner of this bay stands the town of St Helier, very happily fituated. But the principal haven is in the western corner of the bay, which receives its name from it, being called St Aubin's. There are, besides these, several other havens of less note; as, St Brelade's Bay, at the back of St Aubin's; the great bay of St Ouen, which takes in the greatest part of the west side of the island, where the largest ships may ride in 12 and 15 fathoms, sase from all but east winds. La Crevasse is a port only for boats; Greve de Lecg and Port St John are also small havens on the north fide, where is likewife Bonneuit. On the east there is the bay of St Catherine, and the harbour of Rosel. 'To the fouth-west lies the haven Vol. IX. Part I.

de la Chaussée. The last we shall mention is the port Jersey. de Pas, a very little to the eastward of St Aubin's Bay.

The towns of St Helier and St Aubin, which, as already mentioned, fland both in the fame bay called St Aubin's Bay, opening to the fouth, are about three miles afunder. St Helier took its name from Elerius or Helier, a holy man, who lived in this island many centuries ago, and was flain by the Pagan Normans at their coming hither. He is mentioned among the martyrs in the martyrology of Coutance. His little cell with the stone bed is still shown among the rocks; and in memory of him a noble abbey of Canons regular was founded in the little island in this bay, and annexed to Cherburgh abbey in Normandy in the reign of Henry I. and suppressed as an alien priory. The town of St Helier stands at the foot of a long and high rocky hill at the east end. It is a well-built and populous place: greatly improved and enlarged within the last century; and contains about 400 houses. mostly shops, and near 2000 inhabitants. The marketplace in the centre is spacious, furrounded with handfome houses, among which is the Cohue Royale or court of juffice. At the top of the market-place is a flatue of George II, of bronze gilt. The market is held on a Saturday, and much frequented.

St Adbin at the west end of the bay is principally inhabited by merchants and masters of ships, whom the neighbourhood of the port has invited hither. It is not more than half the size of the other town, though greatly increased within these too years; and has a good stone pier carried far into the sea, where ships of considerable burden lie safe under the guns of

the adjoining fort.

The isle of St Helier, more to the east in the fame bay, is in circuit near a mile, furrounded by the fea at or about every half flood. On the fite of the abbey before mentioned is now Elizabeth Castle, one of the largedt and strongest fortresses in Britain. Queen Elizabeth began it, and gave it her name. Charles I. enlarged, and Charles II. who was twice here, completed it. It was the last fortress that held out for the king. It is the residence of the governor and garrison, and occupies the whole isle, from whence at low water is a passage called the bridge, half a mile long, formed of fand and stones. A citadel was begun in the last war on a hill, whence the castle might be bombarded, but since the peace left off.

Mount Orgeuil caille, called also Gourray from the neighbouring village of that name, lies to the fouth of Rofel harbour in the bay of St Catharine. It was a place of firength before Henry Vth's time, and bid defiance to the attemps of the French under the conflable Dc Gueselin 1374 at the end of the reign of Edward III. It was repaired by Queen Elizabeth, but is now neglected, yet preferves an air of grandeur answering its name even in ruins. The ascent to its top is by near 200 sleps; and from thence by a telescape may be seen the two front towers of the catherdral of Coutance. The famous William Prynne was confined in it three years.

The island is divided into 12 parishes, which are so laid out that each has a communication with the sea; these are subdivided into 52 vintaines, so called from the number of 20 houses, which each is supposed to have per

letter, formerly contained, just as in England 10 houses ancient - necessary for bringing any military enterprise to a suc- Jersey. is computed at about 20,000, of which 3000 are able to bear arms, and are formed into regiments. Their general review is on the fandy bay between the two towns, when they are attended with a train of above 20 brafs field pieces and two fmall bodies of horse in the wings.

The chief officer is the governor, who has the cuflody of his majefty's caftles, with the command of the garrifons and militia. The civil government is adminiftered by a bailiff, affifted by 12 jurats. They have here also what they call an assembly of the states. These are convened by the governor or his deputy, the bailiff confifts of himfelf and the jurats, the dean and

clergy, and the 12 high conftables

There were formerly many druidical temples and altars in Jersey, fome remains of which are still to be feen. The cromlechs are here called pouquelays, and there are some tumuli and keeps. Roman coins have also been dug up in this island; and there are the remains of a Roman camp in the manor of Dilamant. Christianity was first planted here in the middle of the 6th century, and the island made part of the see of Dol in Bretagne, and it is now governed by a dean. Besides the abbey of St Helier, here were four priories, Noirmont, St Clement, Bonnenuit, and le Leek, and above twenty chapels, now mostly ruined. During the last war this island, together with that of Guernsey, became an object of defire to France, whose vanity, no less than her interest, was concerned in depriving Britain of those last remnants of her continental possessions. The first attempt to atchieve this conquest took place in the year 1779. A force of 5000 or 6000 men was embarked in flat bottomed boats, and endeavoured to land in the bay of St Ouen, on the first of May. In this attempt they were supported by five frigates and other armed veffels; but met with fuch a vigorous refistance from the militia of the island, assisted by a body of regulars, that they were compelled to retire without having landed a fingle person. Much discontent and mutual recrimination took place among the Erench naval and military officers on this failure; and though the expedition was reprefented by many as ill concerted, and destitute of every hope of success, another attempt was resolved on. Both the troops and seamen that had been employed in the former expedition were equally defirous of retrieving their honour; but they were for fome time prevented from making any attempt of this kind by bad weather; and, before another opportunity offered, the fquadron which was defigned to cover their defcent was attacked by Sir James Wallace, who drove them ashore on the coast of Normandy, silenced a battery under whose guns they had taken shelter, captured a frigate of 34 guns, with two rich prizes, burnt two other large frigates, and a confiderable number of fmaller vessels.

Thus the fcheme of invading the island of Jersey was totally disconcerted, and laid aside for that time, but was resumed in the year 1781. The conduct of this fecond expedition was given to the baron de Rullecourt, who had been fecond in command when the former attempt was made. He was a man of courage,

ly made a tything. The whole number of inhabitants celsful iffue. The force entrufted to him on the prefent occasion consisted of 2000 men; with whom he embarked in very tempeftuous weather, hoping that he might thus be able to furprife the garrifon. Many of his transports, however, were thus dispersed, and he himself, with the remainder, obliged to take shelter in fome islands in the neighbourhood of Jersey. As foon as the weather grew calmer, he feized the opportunity of a dark night to effect landing at a place called Grouville, where he made prisoners of a party of militia. Hence he proceeded with the utmost expedition to St Helier's, the capital of the island, about three miles distant. His arrival was fo unexpected, that he feized on a party of men who guarded it, together with the commanding officer, and the magistrates of the island. Rullecourt then drew up a capitulation, the terms of which were, that the island should be instantly furrendered to the French, and the garrison be fent to England; threatening the town with immediate destruction in case of noncompliance. It was in vain represented to him that no act of the deputygovernor and magistrates could be valid while they remained in his power; but, as Rullecourt still insisted, .. they were obliged to comply, leaft his menaces should have been carried into execution. This point being gained, he advanced to Elizabeth Castle in the neighbourhood of the town, fummoning it to furrender in virtue of the capitulation for the town and island just concluded. To this a peremptory refusal was given, and followed by fuch a vigorous discharge of artillery, that he was obliged to retire into the town. In the mean time the British troops stationed in the island began to affemble from every quarter under the command of Major Pierson; who, on being required by the French commander to submit, replied, that if the French themselves did not, within 20 minutes, lay down their arms, he would attack them. This being refused, an attack was instantly made with such impetuofity, that the French were totally routed in lefs than half an hour, and driven into the market-place, where they endeavoured to make a fland. Their commander, exasperated at this unexpected turn of affairs, endeavoured to wreak his vengeance on the captive governor, whom he obliged to fland by his fide during the whole time of the conflict. This, however, was quickly over; the French were broken on all fides, the baron himself mortally wounded, and the next in command obliged to furrender himself and the whole party prisoners of war; while the captive governor escaped without a wound. This fecond disafter put an end to all hopes of the French ministry of being able to reduce the island of Jersey, and was indeed no fmall mortification to them; 800 troops having been landed at that time, of which not one escaped. A monument was erected at the public expence in thechurch of St Helier, to the memory of Major Pierson, to whom the deliverance of the island was owing; but who unhappily fell in the moment of victory, when only 24 years of age.

All the landing places and creeks round the island are now fortified with batteries, and 17 or 18 watch-houses are erected on the headlands. These are round but fierce and violent in his disposition, and seems to towers with embrasures for small cannon and loop holes have been very deficient in the prudence and conduct for fmall musketry; the entrance by a door in the Jersey. wall out of the reach of man, and to be ascended by a ladder afterwards drawn up. This ifland, with those of Guernsey, Sark, Alderney, and their appendages, were parcel of the duchy of Normandy, and were united to the crown of England by the first princes of the Norman line. The language of the pulpit, and the bar, is the French, which is also that generally fpoken by the people at large. They are governed by their own laws, which are for the most part the ducal customs of Normandy, being collected in an ancient book of customs intitled Le grand coustumier. The king's writ, or process from the courts of Westminster, is here of no force; but his commission is, They are not bound by any common acts of our parliaments, unless particularly named. All causes are originally determined by their own officers, the bailiff and jurats of the islands. But an appeal lies from them to the king and council in the last refort .- Jerfey is an earldom in the Villiers's family.

New JERSEY, or, as it is commonly called, the Ferfeys (being two provinces united into one government), one of the united states of North America, lying from 30 to 41 degrees of north latitude, and from 74 to 75 degrees 30 minutes longitude west from London; in length 160 miles, in breadth 52.

It is bounded on the east by Hudson's river and the fea; on the fouth, by the fea; on the west, by Delaware bay and river, which divides it from the states of Delaware and Pennsylvania; and on the north, by a line drawn from the mouth of Mahakkamak river, in latitude 41° 24', to a point on Hudfon's river, in latitude 41°; containing about 8320 fquare miles, equal to 5,324,800 acres. New Jerfey is divided into 13 counties, which are fubdivided into 04 townthips or precincts. In 1784, a census of the inhabitants was made by order of the legislature, when they amounted to 140,435, of which 10,501 were blacks. Of these blacks 1939 only were flaves; fo that the proportion of flaves to the whole of the inhabitants in the flate is as one to feventy-fix. The population for every square mile is eighteen. As to the face of the country, foil, and productions; the counties of Suffex, Morris, and the northern part of Bergin, are mountainous. As much as five-eighths of molt of the fouthern counties, or one fourth of the whole state, is a fandy barren, unfit for cultivation. The land on the fea coast in this, like that in the more fouthern states, has every appearance of made ground. The foil is generally a light fand; and by digging, on an average, about fifty feet below the furface (which can be done. even at the distance of twenty or thirty miles from the fea, without any impediment from rocks or stones), you come to falt marsh. This state has all the varieties of foil from the worst to the best kind. It has a greater proportion of barrens than any of the states. The barrens produce little else but shrub oaks and white and yellow pines. In the hilly and mountainous parts of the flate, which are not too rocky for cultivation, the foil is of a stronger kind, and covered in its natural flate with flately oaks, hickories, chefnuts, &c. &c. and, when cultivated, produces wheat, rye, Indian corn, buck wheat, oats, barley, flax, and fruits of all kinds common to the climate. The land in this hilly country is good for grazing, and the farmers feed great numbers of cattle for New York and

Philadelphia markets, and many of them keep large Jerfey. dairies. The markets of New York and Philadelphia receive a very confiderable proportion of their fupplies from the contiguous parts of New Jerfey. And it is worthy of remark that these contiguous parts are exceedingly well calculated, as to the nature and fertility of their foils, to afford these supplies; and the intervention of a great number of navigable rivers and creeks renders it very convenient to market their produce. These supplies consist of vegetables of marry kinds, apples, pears, peaches, plums, strawberries, cherries, and other fruits; cyder in large quantities and of the best quality, butter, cheefe, beef, pork, mutton, and the leffer meats.

The trade of this flate is carried on almost folely with and from those two great commercial cities. New York on one fide, and Philadelphia on the other: though it wants not good ports of its own. The articles exported, besides those already mentioned, are wheat, flour, horfes, live cattle, hams, which are celebrated as being the best in the world, lumber, flax, feed, leather, and iron in great quantities in pigs and bars. Formerly copper ore was reckoned among their most valuable exports; but the mines have not been worked fince the commencement of the late war. The iron manufacture is the greatest source of wealth to the flate. Iron works are erected in Gloucester. Burlington, Morris, and other counties. The mountains in the county of Morris give rife to a number of ftreams necessary and convenient for these works, and at the fame time furnish a copious supply of wood and ore of a superior quality. In this county alone are no less than feven rich iron mines, from which might be taken ore fufficient to fupply the United States: and to work it into iron are two furnaces, two rolling and flitting mills, and about thirty forges, containing from two to four fires each. These works produce annually about 540 tons of bar iron, 800 tons of pigs, befides large quantities of hollow ware, fleet iron, and nail rods. In the whole state, it is supposed there is yearly made about 12002 ons of bar iron, 1200 do. of pigs, 80 do. of nail rods, exclusive of hollow ware, and various other castings, of which vast quantities are made.

The character, manners, and customs of the people are various in different parts of the flate. The inhabitants are a collection of Low Dutch, Germans, English, Scotch, Irish, and New Englanders, or their descendants. National attachment and mutual convenience have generally induced thefe feveral kinds of people to fettle together in a body; and in this way their peculiar national manners, cuftoms, and character, are ftill preferved, especially among the lower class of people, who have little intercourse with any but those of their own nation. Religion, although its tendency is to unite people in those things that are effential to happiness, occasions wide differences as to manners, cuftoms, and even character. The Prefbyterian, the Quaker, the Episcopalian, the Baptist, the German and Low Dutch Calvinift, the Methodift, and the Moravian, have each their diftinguishing characteriffics, either in their worship, their discipline, or their drefs. There is still another very perceptible characteristical difference, distinct from either of the others, which arises from the intercourse of the inhaJersey. bitants with different states. The people in West meets, the supreme court sits, and the public offices Jersey. Terfey trade to Philadelphia, and of course imitate their fashions, and imbibe their manners. The inhabitants of East Jersey trade to New York, and regulate their fashions and manners according to those of New York. So that the difference in regard to fashions and manners between East and West Jersey, is nearly as great as between New York and Philadelphia. The people of New Jersey are generally industrious, frugal, and hospitable. There are, comparatively, but few men of learning in the flate, nor can it be faid that the people in general have a tafte for the fciences. The lower class, in which may be included three-fifths of the inhabitants of the whole state, are ignorant, and are criminally neglectful in the education of their children. There are, in this state, about 50 Presbyterian congregations, subject to the care of three Presbyteries, viz. that of New York, of New Brunswick, and Philadelphia; 40 congregations of the Friends; 30 of the Baptifts; 25 of Episcopalians; 28 of the Dutch, befides a few Moravians and Methodifts.

There are two colleges in New Jersey; one at Princeton, called Naffau Hall; the other at Brunswick, called Queen's-college. The college at Princeton was first founded about the year 1738, and enlarged by governor Belcher in 1747. It has an annual income of about L. 900 currency; of which L. 200 arises from funded public fecurities and lands, and the rest from the fees of the students. There is a grammarfchool of about 30 fcholars, connected with the college, under the fuperintendance of the president, and taught by two masters. Before the late revolution this college was furnished with a philosophical apparatus worth L. 500, which (except the elegant orrery conthructed by Mr Rittenhouse) was almost entirely deftroyed during the war, as was also the library, which now confifts of between 2000 and 3000 volumes .- The charter for Queen's-college at Brunswick was granted just before the war, in confequence of an application from a body of the Dutch church. Its funds, raifed wholly by free donations, amounted foon after its establishment to four thousand pounds; but they were confiderably diminished by the war. The fludents are under the care of a prefident. This college has lately increased both in numbers and reputation. There are also a number of flourishing academies in this state; one at Trenton, another in Hakkenfak, others at Orangedale, Freehold, Elizabeth-town, Burlington, Newark, Spring field, Morriftown, Bordentown, and Amboy: but there are no regular establishments for common schools. The usual mode of education is for the inhabitants of a village or neighbourhood to join in affording a temporary support for a schoolmaster, upon fuch terms as is mutually agreeable. But the encouragement which thefe occasional teachers meet with, is generally fuch as that no person of abilities adequate to the bufinefs will undertake it, and of courfe little advantage is derived from thefe fchools.

There are a number of towns in this state, nearly of equal fize and importance, and none that has more than 200 houses, compactly built. - Trenton is the largest town in New Jersey. This town, with Lamberson, which joins it on the fouth, contains 200 houses, and about 1500 inhabitants. Here the legislature

are all kept, except the fecretary's, which is at Burlington. On these accounts it is considered as the capital of the state .- Burlington stands on the east fide of the Delaware, 20 miles above Philadelphia by water. and 17 by land. The island, which is the most populous part of the city, is a mile and a quarter in length, and three quarters of a mile in breadth. On the ifland are 160 houses, 900 white and 100 black inhabitants. There are two houses for public worship in the town, one for the Friends or Quakers, who are the most numerous, and one for the Episcopalians. The other public buildings are two market houses, a court-house, and the best gaol in the state. Besides these, there is an academy, a free fchool, a nail manufactory, and an excellent diffillery, if that can be called excellent which produces a poison both of health and morals .- Perth Amboy stands on a neck of land included between Raritan river and Arthur Kull found. It lies open to Sandy Hook, and has one of the best harbours on the continent. Veffels from fea may enter it in one tide. in almost any weather .- Brunswick was incorporated in 1784, and is fituated on the fouth-well fide of Raritan river, 12 miles above Amboy. It contains about 200 houses and 1600 inhabitants, one half of which are Dutch. Its fituation is low and unpleafant, being on the bank of the river, and under a high hill which rifes back of the town .- Princeton is a pleafant healthy village, of about 80 houses, 52 miles from New York, and 43 from Philadelphia .- Elizabeth town and Newark are pleafant towns; the former is 15, and the latter 9 miles from New York. Newark is famed for its good cyder.

The government of this state is vested in a governor, legislative council, and general assembly. The governor is chosen annually by the council and assembly jointly. The legislative council is composed of one member from each county, chosen annually by the people. The general affembly is composed of three members from each county, chosen by the freemen. The council choose one of their members to be viceprefident, who, when the governor is abfent from the flate, possesses the supreme executive power. The council may originate any bills, excepting preparing and altering any money bill, which is the fole prerogative of the affembly.

The first fettlers of New Jersey were a number of Dutch emigrants from New York, who came over between the years 1614 and 1620, and fettled in the county of Bergen. Next after thefe, in 1627, came over a colony of Swedes and Finns, and fettled on the river Delaware. The Dutch and Swedes, though not in harmony with each other, kept possession of the country many years. In March 1634, Charles II. granted all the territory called by the Dutch New Netherlands, to his brother the duke of York. And in June 1664, the duke granted that part now called New Jersey to Lord Berkeley of Stratton, and Sir George Carteret, jointly; who in 1665 agreed upon certain conceffions with the people for the government of the province, and appointed Philip Carteret, Efq; their governor.—The Dutch reduced the country in 1672; but it was reftored by the peace of Westminster, February 9. 1674.

This state was the feat of war for feveral years, du-

gypt, nº 2.

merica; and her losses, both of men and property. in proportion to the population and wealth of the flate, was greater than of any other of the thirteen

TERSEY, among woolcombers, denotes the finest wool, taken from the rest by dressing it with a Jersey

IERUSALEM, a very famous and ancient city, capital of Judea or Palestine, now a province of Turky in Afia. According to Manetho, an Egyptian hiftorian, it was founded by the shepherds who invaded Egypt in an unknown period of antiquity *. According to Josephus, it was the capital of Melchisedek's kingdom, called Salem in the book of Genefis: and the Arabians affert, that it was built in honour of Melchifedek by 12 neighbouring kings; which when they had done, he called it Jerufalem. We know nothing of it with certainty, however, till the time of king David, who took it from the Jebusites, and made it the capital of his kingdom, which it ever after continued to be. It was first taken in the days of Jehoash, by Hazael the king of Syria, who slew all the nobility, but did not destroy their city. It was afterwards taken by Nebuchadnezzar king of Babylon, who deftroyed it, and carried away the inhabitants. Seventy years after, permission was granted by Cyrus king of Persia to the Jews to rebuild their city, which was done; and it continued the capital of Judea (though frequently fuffering much from the Grecian monarchs of Syria and Egypt), till the time of Vefpafian emperor of Rome, by whose fon Titus it +See Jews, was totally destroyed +. It was, however, rebuilt by Adrian; and feemed likely to have recovered its fored with feveral noble buildings; the Christians also being permitted to fettle in it. But this was a shortlived change; fo that when the empress Helena, mother of Constantine the Great, came to visit this city, she found it in the most forlorn and ruinous situation. Having formed a defign of restoring it to its ancient lustre, the caused, with a great deal of cost and labour, all the rubbish that had been thrown upon those places where our Saviour had suffered, been buried, &c. to be removed. In doing this, they found the crofs on which he died, as well as those of the two malesactors who fuffered with him; and, as the writers of those times relate, discovered by a miracle that which had borne the Saviour of mankind. She then caufed a magnificent church to be built, which inclosed as many of the feenes of our Saviour's fufferings as could conveniently be done, and adorned the city with feveral other buildings. The Emperor Julian is faid to have formed a delign of rebuilding the temple of Jerusalem, and of reftoring the Jewish worship. This scheme was contrived on purpose to give the lie to our Saviour's prophecy concerning the temple and city of Jerusalem; namely, that the first should be totally destroyed, without one stone being lest upon another; and that Jerufalem should be trodden down of the Gentiles till the times of the Gentiles were fulfilled. In this attempt, however, according to the accounts of the Christian writers of that age, the emperror was frustrated by an earthquake and fiery eruption from the earth, which

Ferfey, ring the bloody contest between Great Britain and A- totally destroyed the work, confumed the materials Jerusalem. which had been collected, and killed a great number of the workmen.

This event hath been the fubiect of much diffoute. Mr Warburton, who hath published a treatise expressly on the truth of this fact, hath collected the following testimonies in favour of it. The first is that of Ammianus Marcellinus, who tells us, " Julian (having been already thrice conful), taking Sallust, prefeet of the feveral Gauls, for his colleague, entered a fourth time on this high magistracy; and although his fenfibility of the many and great events which this year was likely to produce made him very anxious for the future, vet he both pushed on the various and complicated preparatives for this expedition. with the utmost application, and, having an eye in. every quarter, and being defirous to enternize his reign by the greatness of his atchievements, he projected to rebuild at an immense expence the proud and magnificent temple of Jerufalem : which (after many combats, attended with much bloodshed on both sides, during the fiege by Vespasian) was with great difficulty taken and destroyed by Titus. He committed the conduct of this affair to Alypius of Antioch, who had formerly been lieutenant in Britain. When therefore this Alypius had fet himfelf to the vigorous execution of his charge, in which he had all the affidance that the governor of the province could afford him, horrible balls of fire breaking out near the foundations, with frequent and reiterated attacks, rendered the place from time to time inaccessible to the scorched and blasted workmen; and the victorious element continuing, in this manner, obstinately and refolutely bent, as it were, to drive them to a dimer grandeur, being furrounded with walls, and adorn- flance, Alypius thought best to give over the enter-

The next testimony is that of Gregory Nazianzen. Speaking of the emperor Julian, he fays, " After having run through a course of every other tyrannical experiment against the faith, and upon trial despising all of them as trifling and contemptible, he at last brought down the whole body of the Jews upon us : whom, for their ancient turn to feditious novelties, and an inveterate hatred of the Christian name, he chose as the fittest instrument for his machinations. Thefe, under a show of great good-will, which hid his fecret purpofe, he endeavoured to convince from their facred books and traditions, which he took upon him to interpret, that now was come the time foretold, when they should return to their own land, rebuild their temple, and restore the law to its ancient force and fplendor. When these things had been thoroughly infinuated, and heartily entertained (for deceit finds eafy admittance when it flatters our paffions), the Jews fet upon the work of rebuilding with great attention, and pushed on the project with the utmost labour and application. But when, now driven from their work by a violent whirlwind and a fudden earthquake, they fled together for refuge to a certain neighbouring church (some to deprecate the impending mischief; others, as is natural in such cases, to catch at any help that prefents itself; and others. again, inveloped in the crowd, were carried along with the body of those who fled), there are who say.

Jerefalem, the church refused them entrance; and that when they under nine kings. At last this kingdom was utterly Jerusalem, ment before, they found them on a fudden closed by a fecret and invisible hand; a hand accustomed to work these wonders by the terror and confusion of the impious, and for the fecurity and comfort of godly men. This, however, is now invariably affirmed and believed by all, that as they strove to force their way in by violence, the fire which burft from the foundations of the temple, met and stopped them. One part it burnt and destroyed, and another it desperately maimed, leaving them a living monument of God's commination and wrath against finners. Thus the affair paffed; and, let no man continue incredulous concerning this or the other miraculous works of God. But still the thing most wonderful and illustrious was, a light which appeared in the heavens, of a cross within a circle. That name and figure which impious men before esteemed so dishonourable upon earth, was now raifed on high, and equally objected to the common view of all men; advanced by God himself as the trophy of his victory over unbelievers; of all trophies the most exalted and sublime. Nav further, they who were prefent, and partakers of the miracle we are now about to fpeak of, show to this very day the fign or figure of the cross which was then marked or impressed upon their garments. For at that time, as these men (whether such as were of us or strangers) were showing these marks, or attending to others who showed them, each presently observed the wonder, either on himfelf or his neighbour; having a radiant mark on his body or on his garment, in which there is fomething that, in azz and elegance, exceeded all painting or embroidery," Notwithstanding thefe testimonies, however, this

fact hath been strenuously contested by others; and indeed it must be owned that the testimonies above mentioned are by no means unexceptionable. In the last particularly, the propensity to the marvellous is fo exceedingly great, that every one must at first fight be ftruck with it. It is true indeed, the most miraculous part of it, as it feemed to be to Gregory, namely, the appearance of croffes upon the garments and bodies of fome of the people who were flruck, may be explained upon a natural principle; fince we are affured that lightning will fometimes produce ef-\$ See Light-fects of this kind 1: but even this is no decifive proof of the authenticity of the relation; though it cannot by any means discredit it, as some think. On the whole, however, it is not a matter of any confequence whether this event happened with the circumstances above mentioned or not. If Julian did make any attempt to rebuild the temple, it is certain that fomcthing obstructed the attempt, because the temple was never actually rebuilt. If he made no fuch attempt, the prophecy of our Saviour still holds good; and it furely cannot be thought to detract from the merit of a propliecy, that no body ever attempted to elude it,

or prove it to be a falsehood.

Jerusalem continued in the hands of the eastern emperors till the reign of the Caliph Omar, who reduced it under his subjection. The Saracens continued in possession of it till the year 1099, when it was taken by the Crufaders. They founded a new kingdom, of which Jerusalem was the capital, which lasted 88 years one continued piece, or rather polished rock. 9. Ac-

came to the doors which were wide open but a mo- ruined by Saladin; and though the Christians once more got possession of the city, they were again obliged to relinquish it. In 1217, the Saracens were expelled by the Turks, who have ever fince continued in

poffession of it.

The city of Jerusalem, in its most flourishing state. was divided into four parts, each inclosed with its own walls; viz. 1. The old city of Jebus, which stood on mount Zion, where the prophets dwelt, and where David built a magnificent castle and palace, which became the refidence both of himfelf and fucceffors : on which account it was emphatically called, the City of David. 2. The lower city, called also the Daughter of Zion, being built after it; on which flood the two magnificent palaces which Solomon built for himself and his queen; that of the Maccabean princes: and the stately amphitheatre built by Herod, capable of containing 80,000 spectators; the strong citadel, built by Antiochus, to command and overtop the temple, but afterwards razed by Simon the Maccabee, who recovered the city from the Syrians; and laftly, a fecond citadel, built by Herod, upon a high and craggy rock, and called by him Antonia. 3. The new city, mostly inhabited by tradefmen, artificers, and merchants; and, 4. Mount Moriah, on which was built the fo famed temple of Solomon, defcribed in the fixth and feventh chapters of the fecond book of Kings ; and, fince then, that rebuilt by the Jews on their return from Babylon, and afterwards built almost anew and greatly adorned and enriched by Herod.

Some idea of the magnificence of this temple may be had from the following confiderations. 1. That there were no less than 163,300 men employed in the work. 2. That notwithstanding that prodigious number of hands, it took up feven whole years in building. 3. That the height of this building was 120 cubits, or 82 yards, rather more than less; and the courts round it about half as high. 4. That the front, on the east fide, was fustained by ramparts of fquare stone, of vast bulk, and built up from the valley below, which last was 300 cubits high, and being added to that of the edifice amounted to 420 cubits; to which, if we add, 5. The height of the principal tower above all the rest, viz. 60, will bring it to 480 cubits, which, reckoning at two feet to a cubit, will amount to 960 feet; but, according to the length of that measure, as others reckon it, viz. at two feet and an half, it will amount to 1200 feet; a prodigious height this from the ground, and fuch as might well make Josephus say, that the very design of it was fufficient to have turned the brain of any but Solomon. 6. These ramparts, which were raised in this manner, to fill up the prodigious chasm made by the deep valley below, and to make the area of a fufficient breadth and length for the edifice, were 1000 cubits in length at the bottom, and 800 at the top, and the breadth of them 100 more. 7. The huge buttreffes which supported the ramparts were of the fame height, square at the top, and 50 cubits broad, and jutted out 150 cubits at the bottom. 8. The stones, of which they were built, were, according to Josephus, 40 cubits long, 12 thick, and 8 high, all of marble, and fo exquisitely joined, that they seemed

cording

eing.

them, we refer the reader to Doctors Shaw and Po- Jerusalem-Terufalem cording to the fame Jewish historian, there were 1453

columns of Parian marble, and twice that number of pilasters; and of such thickness, that three men could hardly embrace them, and their height and capitals proportionable, and of the Corinthian order. But it is likely Josephus hath given us these two last articles from the temple of Herod, there being nothing like them mentioned by the facred historians, but a great deal about the prodigious cedars of Lebanon used in that noble edifice, the excellent workmanship of them adapted to their feveral ends and defigns, together with their gildings and other curious ornaments. The only thing more we shall venture to add is, what is affirmed in Scripture, that all the materials of this flupendous fabric were finished and adapted to their feveral ends before they were brought to Jerusalem, that is, the stones in their quarries, and the cedars in Lebanon; fo that there was no noise of ax, ham-

mer, or any tool, heard in the rearing of it. At prefent Jerusalem is called by the Turks Cudfembaric, and Coudsberiff; and is reduced to a poor thinly inhabited town, about three miles in circumference, fituated on a rocky mountain, furrounded on all fides, except the north, with fleep afcents and deep valleys; and these again environed with other hills, at some distance from them. In the neighbourhood of the city there grow fome corn, vines, olives, &c. The flately church erected by the empress Helena, on mount Calvary, is fill flanding. It is called the church of the fepulchre; and is kept in good repair by the generous offerings of a conflant concourse of pilgrims, who annually refort to it, as well as by the contributions of feveral Christian princes. The walls of this church are of stone, and the roof of cedar; the eaft end incloses Mount Calvary, and the west the holy fepulchre: the former is covered with a noble cupola. open at top, and supported by 16 massive columns. Over the high altar, at the east end, is another stately dome. The nave of the church constitutes the choir; and in the infide ifles are shown the places where the most remarkable circumstances of our Saviour's paffion were transacted, together with the tombs of Godfrey and Baldwin, the two first Christian kings of Jerufalem. In the chapel of the crucifixion is shown the very hole in the rock in which the crofs is faid to have been fixed. The altar in this chapel hath three croffes on it; and is richly adorned, particularly with four lamps of immense value that hang before it, and are kept constantly burning. At the west end is that of the fepulchre, which is hewn in that form out of the folid rock, and hath a fmall dome supported by pillars of porphyry. The cloifter round the fepulchre is divided into fundry chapels, appropriated to the feveral forts of Christians who reside there; as Greeks. Armenians, Maronites, Jacobites, Copts, Abyffines, Georgians, &c. and on the north-west side of it are the apartments of the Latins, who have the care of the church, and are forced to refide constantly in it: the Turks keeping the keys of it, and not fuffering any of them to go out, but obliging them to receive their provisions in at a wicket. At Easter thererepresenting our Lord's passion, crucifixion, death, and refurrection, at which a vaft concourse of pil-

On Mount Moriah, on the fouth-east part of the city, is an edifice called Solomon's Temple, standing on or near the same spot as the ancient; but when or by whom ereded is uncertain. In the midft of it is a Turkish mosque, where the Jewish fanctum fanctorum is supposed to have stood. The building, which Dr Pococke thinks must have been formerly a Christian church, is held in the utmost veneration by the Turks.

The city is now under the government of a fangiac. who refides in a house faid to have been that of Pontius Pilate, over-against the castle of Antonia built by Herod the Great. Many of the churches erected in memory of fome remarkable gospel-transaction, have been fince converted into mosques; into some of which money will procure admittance, but not into others. Both the friars and other Christians are kept fo poor by the tyranny of the government, that the chief fupport and trade of the place confifts in providing ftrangers with food and other accommodations, and felling them beads, relics, and other trinkets, for which they are obliged to pay confiderable fums to the fangiac, as well as to his officers; and those are feldom so well contented with their usual duties, but they frequently extort fome fresh ones, especially from the Franciscans, whose convent is the common receptacle for all pilgrims, and for which they have confiderable allowances from the pope, and other crowned heads, besides the presents which strangers generally make them at their departure. The most remarkable antiquities in the neighbourhood of Jerusalem are, 1. The pools of Bethefda and Gihon; the former 120 paces long, 40 broad, and at least eight deep, but now without water; and the old arches, which it still discovers at the west end, are quite dammed up: the other, which is about a quarter of a mile without Bethlehem-gate, is a very stately relic, 100 paces long, and 60 broad, lined with a wall and plafter, and ftill well flored with water. 2. The tomb of the Virgin Mary, in the valley of Jehoshaphat, into which one descends by a magnificent flight of 47 fleps. On the right hand as one goes down, is also the sepulchre of St Ann the mother, and on the left that of Joseph the husband, of the virgin-mother: fome add likewife that of Jehoiakim her father. In all these are erected altars for priests of all forts to fay mass, and the whole is cut into the folid rock, 3. The tomb of king Jehoshaphat, cut likewife into the rock, and divided into feveral apartments; in one of which is his tomb, which is adorned with a stately portico and entablature over it. 4. That commonly called Abfalom's pillar or place, as being generally supposed to be that which he is faid to have erected in his life-time to perpetuate his memory, as he had no male-iffue. The place, however, both within and without, hath more the refemblance of a fepulchre than any thing elfe: though we do not read that he was buried there, neither do the people here affirm that he was. There is a great heap of stones about it, which is continually increasing; the superstitious. Jews and Turks always throwing some as they are fome grand ceremonies performed in the church, pass, in token of their abhorrence of Absalom's unnatural rebellion against so good and holy a parent. The structure itself is about 20 cubits square, and 60 grims commonly affift. For a particular account of high, riting in a lofty fquare, adorned below with four columns

Tefting.

Jerufalem columns of the Ionic order, with their capitals, entablatures, &c. to each front. From the height of 20 to 40 cubits, it is fomewhat lefs, and quite plain, excepting a small fillet at the upper end; and from 40 to the top it changes into a round, which grows gradually into a point, the whole cut out of the folid rock. There is a room within, confiderably higher than the level of the ground without, on the fides of which are niches, probably to receive coffins. 5. A little east-ward of this is that called the tomb of Zechariah, the fon of Barachiali, whom the Jews flew between the temple and the altar, as is commonly supposed. This fabric is all cut out of the natural rock, 18 feet high, and as many fquare; and adorned with Ionic columns on each front, cut out likewise of the same rock, and fupporting a cornice. The whole ends in a pointed top, like a diamond. But the most curious, grand, and elaborate pieces, in this kind, are the grotts without the walls of Jerusalem, styled the royal sepulchres; but of what kings is not agreed on. They consist of a great number of apartments, fome of them spacious, all cut out of the folid marble rock; and may juftly be pronounced a royal work, and one of the most noble, furprifing, and magnificent. For a particular account of them we must refer the reader, for want of room, to Pococke's Travels. In the neighbourhood of Jerusalem is a spot of ground, about 30 yards long and 15 broad, now the burying-place of the Armenians, which is shown as the Aceldama, or Field of Blood, formerly the Potter's Field, and fince styled Campo Santto, or the Holy Field, purchased with the price of Judas's treason, for the burial of strangers. It is walled round, to prevent the Turks abusing the bones of Christians; and one half of it is taken up by a building in the nature of a charnel house. Besides the above, a great many other antiquities in the city and its environs are shown to strangers; there being scarce any place or transaction mentioned either in the Old or New Testament, but they show the very spot of ground where the one flood, and the other was done; not only here, but all over Judæa.

IESI, an ancient town of Italy, in the territory of the church, and in the marca or march of Ancona, with a bishop's see. It is seated on a mountain, near a river of the same name, in E. Long. 12. 20. N. Lat.

JESSO, Jedso, or Yadfo, a large island of Asia to the north of Niphon, and faid to be governed by a prince tributary to the empire of Japan; but is very little known to the Europeans, fo that nothing can be iaid with certainty concerning it.

JESSES, ribbons that hang down from garlands or crowns in falconry; also short straps of leather fa-

stened to the hawk's legs, and so to vervels.

JESTING, or concife wit, as distinguished from continued wit or humour, lies either in the thought, or the lauguage, or both. In the first case it does not depend upon any particular words or turn of the expression. But the greatest fund of jests lies in the language, i. e. in tropes or verbal figures; those afforded by tropes confift in the metaphorical fense of the words, and those of verbal figures principally turn

upon a double fense of the same word, or a similitude of found in different words. The third kind of jokes, which lie both in the fense and language, arise from figures of

fentences, where the figure itself confits in the fense, Jesuits. but the wit turns upon the choice of the words.

JESUITS, or the Society of JESUS; a famous religious order of the Romish church, founded by Ignatius Loyola. See IGNATIUS .- The plan which this fana- Foundation tic formed of its constitution and laws was suggested, of the oras he gave out, and as his followers still teach, by the derimmediate inspiration of heaven. But notwithstanding this high pretention, his defign met at first with violent opposition. The pope, to whom Loyola had applied for the fanction of his authority to confirm the inflitution, referred his perition to a committee of cardinals. They reprefented the establishment to be unnecessary as well as dangerous, and Paul refused to grant his approbation of it. At last, Lovola removed all his scruples by an offer which it was impossible for any pope to refift. He proposed, that besides the three vows of poverty, of chastity, and of monastic obedience, which are common to all the orders of regulars, the members of his fociety should take a fourth vow of obedience to the pope, binding themselves to go whitherfoever he should command for the service of religion, and without requiring any thing from the holy see for their support. At a time when the papal authority had received such a shock by the revolt of so many nations from the Romish church; at a time when every part of the popish system was attacked with so much violence and success, the acquisition of a body of men, thus peculiarly devoted to the fee of Rome, Confirmed and whom it might fet in opposition to all its enemies, by the was an object of the highest consequence. Paul in pope, and flantly perceiving this, confirmed the inflitution of the motives. Jesuits by his bull, granted the most ample privileges to the members of the fociety, and appointed Loyola to be the first general of the order. The event hath full justified Paul's discernment, in expecting such beneficial confequences to the fee of Rome from this institution. In less than half a century, the society obtained establishments in every country that adhered to the Roman catholic church: its power and wealth increafed amazingly; the number of its members became great; their character as well as accomplishments were ftill greater; and the Jesuits were celebrated by the friends and dreaded by the enemies of the Romish faith as the most able and enterprising order in

the church. The conflitution and laws of the fociety were perfected by Laynez and Aquaviva, the two generals who fucceeded Loyola, men far superior to their master in abilities and in the science of government. They framed that fyllem of profound and artful policy which diftinguishes the order. The large infusion of fanaticifm mingled with its regulation should be imputed to Loyola its founder. Many circumstances concurred in giving a peculiarity of character to the order of Jesuits, and in forming the members of it not only to take greater part in the affairs of the world than any other body of monks, but to acquire superior influence

in the conduct of them.

The primary object of almost all the monastic orders The object is to separate men from the world, and from any con- of the orcern in its affairs. In the folitude and filence of the der fingucloifter, the monk is called to work out his own fal. lar. vation by extraordinary acts of mortification and piety. He is dead to the world, and ought not to mingle

contrary, the Jesuits are taught to consider themselves as formed for action. They are chosen soldiers, bound to exert themselves continually in the service of God, and of the pope his vicar on earth. Whatever tends to instruct the ignorant, whatever can be of use to reclaim or to oppose the enemies of the holy see, is their proper object. That they may have full leifure for this active fervice, they are totally exempted from those functions the performance of which is the chief business of other monks. They appear in no proces-fions; they practise no rigorous austerities; they do not confume one half of their time in the repetition of tedious offices: but they are required to attend to all the transactions of the world, on account of the influence which these may have upon religion; they are directed to fludy the dispositions of persons in high rank, and to cultivate their friendship; and by the very conflitution as well as genius of the order, a fpirit of action and intrigue is infused into all its members.

As the object of the fociety of Jesuits differed from that of the other monastic orders, the diversity was no less in the form of its government. The other orders are to be confidered as voluntary affociations, in which whatever affects the whole body is regulated by the common fuffrage of all its members. The executive power is vested in the persons placed at the head of each convent or of the whole fociety; the legiflative authority resides in the community. Affairs of moment, relating to particular convents, are determined in conventual chapters; fuch as respect the whole order are confidered in general congregations. But Loyola, full of the ideas of implicit obedience, which he had derived from his military profession, appointed that the government of his order should be purely monarchical. A general, chosen for life by deputies from the feveral provinces, posselfed power that was supreme and independent, extending to every person and to every case. He, by his sole authority, nominated provincials, rectors, and every other officer employed in the government of the fociety, and could remove them at pleasure. In him was vested the sovereign administration of the revenues and funds of the order. Every member belonging to it was at his disposal; and by his uncontrollable mandate he could impose on them any task, or employ them in what service soever he pleased. To his commands they were required to yield not only outward obedience, but to refign up to him the inclinations of their own wills and the fentiments of their own understandings. They were to liften to his injunctions as if they had been uttered by Christ himself. Under his direction they were to be mere passive instruments, like clay in the hands of the potter, or like dead carcafes incapable of relifance. Such a fingular form of policy could not fail to impress its character on all the members of the order, and to give a peculiar force to all its operations. There is not, in the annals of mankind, any example of fuch a perfect despotism, exercised not over monks that up in the cells of a convent, but over men dispersed among all the nations of the earth.

VOL. IX. Part I.

Tefuits. in its transactions. He can be of no benefit to man-fully provide for his being perfectly informed with re-Jefuits. kind but by his example and by his prayers. On the fpect to the character and abilities of his fubiects, Every novice who offers himfelf as a candidate for entering into the order, is obliged to manifest his conscience to the superior, or a person appointed by him; and is required to confess not only his fins and defects. but to discover the inclinations, the passions, and the bent of his foul. This manifestation must be renewed every fix months. The fociety, not fatisfied with penetrating in this manner into the innermost recesses of the heart, directs each member to observe the words and actions of the novices: they are constituted spies upon their conduct, and are bound to disclose every thing of importance concerning them to the superior. In order that this fcrutiny into their character may be as complete as possible, a long noviciate must expire, during which they pass through the several gradations of ranks in the fociety; and they must have attained the full age of thirty-three years before they can be admitted to take the final vows, by which they become professed members. By these various methods, the superiors, under whose immediate inspection the novices are placed, acquire a thorough knowledge of their dispofitions and talents. In order that the general, who is the foul that animates and moves the whole fociety, may have under his eye every thing necessary to inform or direct him, the provincials and heads of the feveral houses are obliged to transmit to him regular and frequent reports concerning the members under their inspection. In these they descend into minute details with respect to the character of each person, his abilities natural or acquired, his temper, his experience in affairs, and the particular department for which he is best fitted. These reports, when digested and arranged, are entered into registers kept of purpose, that the general may, at one comprehensive view, survey the state of the society in every corner of the earth ; observe the qualifications and talents of its members; and thus choose, with perfect information, the inftruments which his absolute power can employ in any fervice for which he thinks meet to deftine them.

As it was the professed intention of the order of Progress of Jesuits to labour with unwearied zeal in promoting the power the falvation of men, this engaged them of course in and influ-many active functions. From their first institution, order. they confidered the education of youth as their peculiar province; they aimed at being spiritual guides and confessors; they preached frequently in order to inthruct the people; they fet out as mislionaries to convert unbelieving nations. The novelty of the inftitution, as well as the fingularity of its objects, procured the order many admirers and patrons. The governors of the fociety had the address to avail themselves of every circumstance in its favour; and in a short time the number as well as influence of its members increafed wonderfully. Before the expiration of the fixteenth century, the Jefuits had obtained the chief direction of the education of youth in every catholic country in Europe. They had become the confessors of almost all its monarchs; a function of no fmall importance in any reign, but, under a weak prince, fuperior ever to that of minister. They were the spiritual guides of almost every person eminent for rank As the conflitutions of the order vest in the general or power. They possessed the highest degree of confuch absolute dominion over all its members, they care- fidence and interest with the papal court, as the most

fect discernment; and, by means of his absolute power, could carry them on with the utmost vigour and

Of its wealth

effects of

Together with the power of the order, its wealth continued to increase. Various expedients were devifed for eluding the obligation of the vow of poverty. The order acquired ample possessions in every catholic country; and by the number as well as magnificence of its public buildings, together with the value of its property, moveable or real, it vied with the most opulent of the monastic fraternities. Besides the sources of wealth common to all the regular clergy, the Iefuits poffeffed one which was peculiar to themselves. Under pretext of promoting the fuccess of their misfions, and of facilitating the support of their missionaries, they obtained a special licence from the court of Rome to trade with the nations which they laboured to convert. In consequence of this, they engaged in an extensive and lucrative commerce both in the East and West Indies. They opened warehouses in different parts of Europe, in which they vended their commodities. Not fatisfied with trade alone, they imitated the example of other commercial focieties, and aimed at obtaining fettlements. They acquired poffession accordingly of a large and fertile province in the fouthern continent of America, and reigned as fovereigns over fome hundred thousand subjects.

Unhappily for mankind, the vaft influence which Pernicious the order of Jesuits acquired by all these different these on ci- means, has been often exerted with the most pernicious vil fociety. effect. Such was the tendency of that discipline obferved by the fociety in forming its members, and fuch the fundamental maxims in its constitution, that every Jesuit was taught to regard the interest of the order as the capital object to which every confideration was to be facrificed. This spirit of attachment to their order, the most ardent perhaps that ever influenced any body of men, is the characteristic principle of the Jefuits, and ferves as a key to the genius of their policy as well as the peculiarities in their fentiments and conduct.

As it was for the honour and advantage of the fociety that its members should possess an ascendant over persons in high rank or of great power; the defire of acquiring and prescrying such a direction of their conduct with greater facility, has led the Jesuits to propagate a fystem of relaxed and pliant morality, which accommodates itself to the passions of men, which justifies their vices, which tolerates their imperfections, which authorifes almost every action that the most audacious or crafty politician would wish to per-

nefted with the prefervation of the papal authority,

Lefuits. zealous and able champions for its authority. The the Jefuits, influenced by the fame principle of atadvantages which an active and enterprifing body of tachment to the interests of their fociety, have been men might derive from all these circumstances are ob- the most zealous patrons of those doctrines which vious. As the order derived both reputation and authority from the zeal with which it flood forth in defence of the Romish church against the attacks of the reform. ers, its members, proud of this diffinction, have confidered it as their peculiar function to combat the opinions and to check the progress of the Protestants. They have made use of every art, and have employed every weapon against them. They have fet themfelves in opposition to every gentle or tolerating meafure in their favour. They have inceffantly ftirred up against them all the rage of ecclefiastical and civil per-

Monks of other denominations have indeed ventured to teach the same pernicious doctrines, and have held opinions equally inconfiftent with the order and happiness of civil society. But they, from reasons which are obvious, have either delivered fuch opinions with greater referve, or have propagated them with less success. Whoever recollects the events which have happened in Europe during two centuries, will find that the Jefuits may juftly be confidered as responsible for most of the pernicious effects arising from that corrupt and dangerous cafuiftry, from those extravagant tenets concerning ecclefialtical power, and from that intolerant ipirit, which have been the difgrace of the church of Rome throughout that period, and which have brought fo many calamities upon civil fo-

But, amidst many bad consequences slowing from Some adthe inflitution of this order, mankind, it must be ac a a tageste-knowledged, have derived from it some considerable fulling from the advantages. As the Jesuits made the education of the design of the source of t youth one of their capital objects, and as their first of this attempts to establish colleges for the reception of stu. order. dents were violently opposed by the universities in different countries, it became necessary for them, as the most effectual method of acquiring the public favour, to furpass their rivals in science and industry. This prompted them to cultivate the study of ancient literature with extraordinary ardour. This put them upon various methods for facilitating the instruction of youth; and, by the improvements which they made in it, they have contributed fo much towards the pro-

many branches of science, and can alone boast of a greater number of ingenious authors than all the other As the prosperity of the order was intimately con-religious fraternities taken together. But it is in the new world that the Jesuits have ex-

gress of polite learning, that on this account they have

merited well of fociety. Nor has the order of Jesuits

been fuccefsful only in teaching the elements of lite-

rature; it has produced likewife eminent mafters in

guay.

Vefuits, hibited the most wonderful display of their abilities, the human species. The conquerors of that unfortunate quarter of the globe had nothing in view but to plunder, to enflave, and to exterminate its inhabitants. The Jesuits alone have made humanity the object of their fettling there. About the beginning of the last Settlement century, they obtained admission into the fertile province of Paraguay, which stretches across the southern continent of America, from the bottom of the mountains of Potofi to the confines of the Spanish and Portuguese settlements on the banks of the river de la Plata. They found the inhabitants in a state little different from that which takes place among men when they first begin to unite together; strangers to the arts, fubfifting precariously by hunting or fishing, and hardly acquainted with the first principles of subordination and government. The Jesuits set themfelves to instruct and to civilize these savages. They taught them to cultivate the ground, to rear tame animals, and to build houses. They brought them to of fociety, and accustomed them to the bleffings of fecurity and order. These people became the subjects of their benefactors, who have governed them with a tender attention, refembling that with which a father directs his children. Respected and beloved almost to adoration, a few Jefuits prefided over fome hundred thousand Indians. They maintained a perfect equality among all the members of the community. Lach of them was obliged to labour, not for himfelf alone, but for the public. The produce of their fields, together with the fruits of their industry of every fpecies, were deposited in common storehouses, from which each individual received every thing necessary for the

> nocent and happy people. over all the fouthern continent of America. With fible to attain. this view, in order to prevent the Spaniards or Portuguefe in the adjacent fettlements from acquiring any conflitution of this order, rendered it early obnoxious dangerous influence over the people within the limits to fome of the principal powers in Europe, and graof the province subject to the society, the Jesuits en- dually brought on its downsal. The emperor Charles V. deavoured to inspire the Indians with harred and con- faw it expedient to check its progress in his domitempt of these nations. They cut off all intercourse nions; it was expelled England, by proclamation between their subjects and the Spanish or Portuguese 2 James I. in 1604; Venice, in 1606; Portugal, in fettlements. They prohibited any private trader of 1759; France, in 1764; Spain and Sicily, in 1767; either nation from entering their territories. racter from the neighbouring governments, they did Jesuits. and have contributed most effectually to the benefit of not permit him to have any conversation with their fubjects; and no Indian was allowed even to enter the house where these strangers resided unless in the prefence of a Jesuit. In order to render any communication between them as difficult as possible, they industriously avoided giving the Indians any knowledge of the Spanish or of any other European language; but encouraged the different tribes which they had civilized to acquire a certain dialect of the Indian tongue, and laboured to make that the universal language throughout their dominions. As all these precautions, without military force, would have been infufficient to have rendered their empire fecure and permanent, they instructed their subjects in the European arts of war. They formed them into bodies of cavalry and infantry, completely armed and regularly disciplined. They provided a great train of artillery, as well as magazines flored with all the implements of war. Thus they established an army so numerous and wellappointed, as to be formidable in a country where a live together in villages. They trained them to arts few fickly and ill-difciplined battalions composed all and manufactures. They made them tafte the sweets the military force kept on foot by the Spaniards or Portuguese.

Such were the laws, the policy, and the genins of Downfal this formidable order; of which, however, a perfect of the order knowledge has only been attainable of late. Europe in Europe. had observed, for two centuries, the ambition and power of the order. But while it felt many fatal ef-

fects of these, it could not fully discern the causes to which they were to be imputed. It was unacquainted with many of the fingular regulations in the political conftitution or government of the Jesuits, which formed the enterprifing spirit of intrigue that distinguished its members, and elevated the body itself to such a height of power. It was a fundamental maxim with fupply of his wants. By this inflitution, almost all the Jesuits, from their first institution, not to publish the passions which disturb the peace of society, and the rules of their order. These they kept concealed render the members of it unhappy, were extinguished. as an impenetrable mystery. The account there given being, however, fomewhat defective and indistinct in regard both to the enumeration of the species and the botanical distinctions, it has been thought proper to supply those defects in this place by the following more particular descriptions and additional notices concerning an article of fo great importance in the materia medica.

" I CINCHONA OFFICINALIS (Quinquina Gondam. Acta Gallie. 1738), PERUVIAN-BARK Tree. The cha-

racters are as follows.

"Cal. Perianthium monophyllum, fuperum, quinenefidum, minimum, perfiftens. Cor. monopetala, infundibuliformis; tubus cylindricus, longus; limbus patulus, quinquifidus, acutus. Stam. Filamenta quinque, minima; antheræ oblongæ, intra faucem corollæ. Plf. Germen fubrotundum, inferum ; ftylus longitudine corollæ, stigma crassiusculum, oblongum, simplex. Per. Capsula fubrotunda; calyce coronata, bilocularis, a bafi verfus apicem bifariam dehiscens. Sem. plurima, oblonga, compressa, marginata. Observ. Flos interdum demit quintam partem numeri in fingulis partibus."

In Vol. XL. of the Phil. Trans. p. 81. No 446. there is an account of the Jesuits-bark tree of Peru by Mr William Arrot .- M. de la Condamine afterwards gave a more particular and scientific account of this tree: fince which specimens of the fructification have been fent to Europe; and Dr Pulteney has given an excellent figure in his inaugural differtation De Cortice Peruviano in 1764, from which our figure is

Plate

The properties and preparations of the Peruvian bark have been already fufficiently detailed under the article CINCHONA. We shall here add the following notice of a new preparation of this bark recommended by M. Lunel. He directs to "boil fix grains of falt of tartar with an ounce of bark in a pint of water; and, after filtering the decoction, another pint of water is to be boiled with the same quantity of falt and the remaining bark. In this way no bitterness remains; at the same time that the strength of the bark appears to be completely exhausted, as alcohol only extracted two grains of refin from it."

2. CINCHONA CARIBÆA feu JAMAICENSIS. Of this bark Dr Wright has given an accurate description with an elegant engraving in the Phil. Tranf. vol. lxvii. p. 504, from which we shall extract the botanic characters

fo as to diffinguish it from other species.

" Fol. ovata, integerrima, acuta, enervia, oppofita. Flor. fingulares, axillares. Cal. Perianthium monophyl-CCLIII. lum, quinquefidum, minimum, perfiftens, campanulatum, obfoletiffimi, qui quedentatum. Cor. monopetala, infundibuliformis; tubus cylindraceus, longissimus; limbus quinquepartitus, tubo æqualis; laciniis ovatis, oblongis, reflexis, quandoque pendulis. Stam. Filamenta quinque, filiformia, erecta e medio tubi, longitudine corollæ; antheræ longissimæ, obtusæ, erectæ supra basin exteriorem, affixæ in fauce corollæ. Capf. bipartibilis, in duas partes diffepimento parallelo, latere inferiore dehifcens. Sem. plurima, compressa, marginata, oblonga."

Dr Wright at first found this tree of a small size; fince which he discovered it 50 feet high, and of a pro-

portional height.

woody; that from the limbs and roots, when dry, breaks thort off, and powders easier than the Peruvian bark. The Jesuits bark of Jamaica is one of the most agreeable bitters; and infused in wine or spirits with a little lemon peel, makes a rich and elegant tincture.

In the north fide of Jamaica, where this bark is produced in the greatest perfection, it is held in high esteem, and answers every purpose of the Jesuits bark. It fits eafy on the stomach, and never occasions vomiting nor naufea, but checks them in remitting fevers, or where the stomach is weak or disordered.

3. CINCHONA TRIFLORA: "Foliis oppositis, ovatis, acutis, integerrimis, petiolatis; Floribus tribus, axillaribus."

The leaves are like the Cinchona Caribæa, but larger. The flowers three in number from the axillæ of the leaves, and of a fine red colour. The laciniæ are reflect-The feed-veffels are larger than any of the other fpecies we have yet feen.

Mr Roberts discovered this bark tree about the year 1781, but found it no where else than in that district of Jamaica called Manchioneel. It grows by the fide of a small rapid river near the Bath, and is about 35 feet

high, but not thick in proportion.

Towards the bottom of the trunk the bark is rough. and furrowed; but higher up it is fmooth, and has much the appearance of the Peruvian bark. It is thinner, more fibrous, and redder, than either the Peruvian or the Jamaica bark already mentioned. When powdered, it is of a cinnamon colour, inclining more to red. The tafte is musty, bitter, and aftringent. It yields its qualities either infused in wine or spirits, but with fome difficulty to cold infusion by water.

Trials have been made with this bark in the cure of fevers, and in feveral with fuccess. But few people could bear more than 20 grains, and even that quantity fometimes occasioned fo distressing a sickness and naufea that its exhibition has been in general left off.

4. CINCHONA FLORIBUNDA, (Phil. Trans. vol. lxxiv. tab. 19. page 452.), St Lucia-BARK Tree. chona floribus panniculatis, glabris; laciniis linearibus, tubo longioribus; staminis exfertis; foliis ellipticis, glabris."

The specimen of this bark we have examined was externally fmooth; it was thin, and very fibrous. Its tatte was a most nauseous bitter, that lasted long in the mouth; its aftringent quality was more than the Peruvian bark.

This bark is violently emetic when fresh; but on long keeping, it lofes this quality in part only, as no . more than 20 grains can be ventured on, and its re-

petition at feveral-hours diftance.

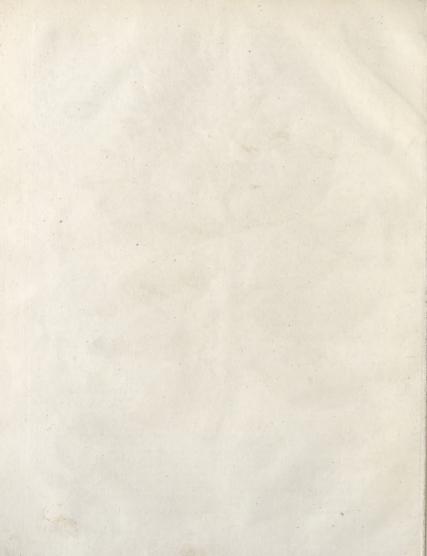

Intermitting and remitting fevers have been cured by this bark, after resisting the use of the Peruvian bark. But it is probable that in those cases the cure was effected more from its emetic powers than by its tonic virtues. At present, however, it has gone intodifuse, except perhaps in the islands where it grows, or where the Peruvian bark has either failed, or cannot eafily be got to hand.

5. CINCHONA BRACHTCARPA: " Foliis ellipticis, rigidis, obtufis, glabris; Floribus panniculatis, glabris; Cup-

fulis ovatis, costatis.

Mr John Lindsay surgeon, Westmoreland, Jamaica, The bark from the larger trunk is very fibrous and an expert and diligent botanist, discovered this species

Jesuits Bark (Cinchona officinalis.) Plate CCLII. Tollowochitt. Julus. MBell Com Hal Sulptor freit.

Tefuits

Tefus.

about the year 1785. It grew on the fide of a fteep of Cinchona Antillana and Cinchona Herbacea; but as no hill or eminence running from east to west, and the descriptions are added, we can say nothing concerning

tree was only about eight or ten feet high.

The leaves in a recent flate were oval, fhining, and rigid; the fprig dries with great difficulty, and turns to a rufty brown. The spike has many white flowers, for the Peruvian bark. See London Medical Journal. fimilar in figure to those of the St Lucia bark tree. The feed-veffels are larger than those of the Peruvian. The feeds are small and scaly. The trunks of this small tree are much furrowed: the cuticle very thick; the bark farther up, fmooth and brown; that of the infide is of the colour of the Peruvian bark, but more fibrous. It has no aroma; and is less bitter, but more affringent, than the cinchona officinalis.

Mr Lindsay has made trial of this bark in the cure of intermitting and remitting fevers with fuccefs. He finds that the stomach will bear 25 or 30 grains very well. He has used it also in tincture and decoction, in various cases of dyspepsia, with advantage. On the whole, were this bark to be had in fufficient quantity, it promises to be an useful succedaneum to the Peru-

vian bark.

6. CINCHONA ANGUSTIFOLIA: " Floribus panniculatis glabris; Capfulis oblongis pentagonis; Foliis linearibus anceolatis." (Vide Ad. Stockholm, vol. viii, 1787, p. 117.

7. CINCHONA MONTANA. This species, which is a native of Guadaloupe and Martinico, was first described by M. Mallet, in the Journal de Physique for March 1781, under the name of Quinquina Piton; and is faid to have been employed by the author with the happieft effects, in intermittent fevers, even after the Peruvian bark had failed .- It has fince been fcientifically defcribed, and a figure of it given, by M. Badier in the Journal de Physique, Feb. 1789, under the name of "Cinchona Montana, foliis ovatis utrinque glabris, stipulis basi connato-vaginantibus, corymbo terminali, corollis glabris." described as a very beautiful tree, growing more than 40 feet high, and having a large regular head of branches with a thick foliage. The bark, when the epidermis is removed, is of a grey-brown colour, and its tafte very bitter. It would feem to contain no refin, all its extract being foluble in water. It is however represented as a very quick and powerful febrifuge, as we have already noticed; at the same time that it possesses an emetic and cathartic property. To these possibly its effect on fever may be in part owing ; though whether its evacuating qualities will admit of its ever becoming a good substitute for the officinalis, or whether it possesses any tonic power, remains yet to be determined

8. CINCHONA SPINOSA; thus described in the Fournal de Physique for October 1790: " Foliis minimis fubrotundis, pedunculis unifloris, corollis glabris quadrifidis tetrandris, feminibus subemarginatis." It is a native of St Domingo. The flowers are like those of the Caribaa, but smaller by a half. It is but a shrubby plant, not exceeding eight or ten feet in height. The leaves are small and very glabrous, and the branches terminated by a spine. The peculiar properties of this bark, or its comparative efficacy as a medicine, have not

yet been afcertained.

9, 10. In the Manuel des Vegetaun by M. de St Germain, we find two species mentioned under the names

II. A bark under the name of ANGUSTURA BARK has lately been introduced into practice as a substitute vol. x. page 154.

This bark is of much the fame colour and thickness as the canella aromatica, and powders very freely. It has a good deal of the aromatic tafte joined to bitterness and altringency; and has been supposed a true species of cinchona, different from the blanca or white fort mentioned

by Mr William Arrot in Phil. Trans. vol. xl. n° 446. Mr Bruce, however, is faid to have pronounced it to be the bark of the Brucea antidysenterica; to which indeed

the refemblance is very confiderable in its effects. The Angustura bark was supposed at first to be

the production of a tree growing on the coast of Africa; but is now found to come from the Spanish Main. According to Experiments and Observations on the Angustura bark, by Augustus Everard Brande, just published, it is said to excel the Peruvian bark in some of its properties, and in other diseases to have different qualities. It is a powerful bitter, joined with an aroma not more pungent than the cascarilla, having a portion of pure oil which approaches in its nature to camphor. It differs from the Peruvian bark, by poffeffing a narcotic principle; and feems more powerful than it both as a tonic and an antifeptic. Various experiments on the antiseptic power of different substances are related, in which the columbo feems the leaft efficacious, and the Angustura bark to claim the highest rank. The following is given as the best mode of preparing the extract.

" The quantity of extract obtained by the following: method is somewhat less than by boiling, but it appears altogether the best. Four ounces of powdered Angustura bark were put into a sannel bag of a conical shape: a sufficiency of boiling water was thenpoured upon it, and this repeated till the filtering liquor had but little tafte or colour. On evaporation by a gentle heat, there remained 13 drams and one scruple of an extract, poffeffing the full flavour of the bark, and which contained two drams of refinous matter."

Half a pound of bruifed Angustura bark was put into a still with a gallon of water, and two quarts drawn off. This diffilled water has a very fingular flavour, perhaps something like strong parsley water. A white effential oil swam on the surface, but in too small a quantity for separation or ascertaining its weight. This possesses the full smell of the bark, and is acrid to the tafte, leaving a glow in the mouth like camphire. From fix pounds of this bark, it is faid, only two fcruples of effential oil have been obtained by diffillation .- The tincture feems also an useful preparation, but the refin in its pure state appears acrid and stimulating.

In Mr Brande's practice this bark feems to have excelled the Peruvian in curing intermittents: Dr Pearfon, however, found that it was scarcely superior in any inflance, and fometimes not equal; but in low fevers, and putrid fevers, it feemed superior. In the headach, attended with fever, but arifing from the stomach, Mr. Brande found it useful; and in dysentery and dyspepsia: it has been of great fervice.

JESUS the Son of SIRACH, a native of Ierufalem.

composed, about 200 B. C. the book of Ecclesiasticus, apostles; whom, however, he sent out only once, and T Jesus called by the Greeks Havageto, " replenished with virtue :" who also quote it under the title of the Wisdom of Solomon the fon of Sirach. His grandson, who was also of the same name, and a native of Jerusalem, translated it from the Hebrew into Greek about 121 B. C. We have this Greek version, but the Hebrew text is loft.

JESUS CHRIST, the Son of God, and Saviour of mankind, descended from heaven, and took upon him the human nature in Judæa, towards the conclusion of the reign of Herod the Great, king of that country. The place of his birth was Bethlehem, a flourishing city of Judah ; but the year in which he was born is not precifely afcertained. The most general opinion is. that it happened about the year of Rome 748 or 749, and about 18 months before the death of Herod. Four infpired writers have transmitted to us an account of the life of Jesus Christ. They mention particularly his birth, lineage, family, and parents; but fay very little concerning his infancy and earlier youth. Herod being informed that the Messiah, or king of the Jews, fo much spoken of by the prophets, was now born, being afraid that his kingdom should now be taken away, contrived how to deftroy his supposed rival: but Christ, being carried, while very young, into Egypt, escaped the cruelty of the tyrant; who, being determined to make fure work, made a general maffacre of the infants about Bethlehem, from the age of two years and under.

After the death of Herod, our Saviour was brought back to Judæa; but we are totally ignorant of what his employment was during the interval between his return thither and the time of his entering upon the ministry. We know only, that when he was but 12 years of age, he disputed in the temple with the most learned of the Jewish doctors; whom he surprised with his knowledge, and the answers he gave to their questions. After this, as the scripture tells us, he continued with his parents, and was fubject to them, till he entered upon his ministry. It is faid, indeed, though upon no fure foundation, that during this period he followed the trade of his father, who was a carpenter. In the 30th year of his age, he began his public ministry; to which the attention of the people was drawn by the preaching of John, a prophet miraculoufly inspired of God to proclaim the existence of the Saviour, as now descended upon earth, and visible to the eyes of all; and by this prophet Christ himself was baptized in the waters of Jordan, that he might not, in any point, neglect to answer the demands of the Jewish law.

It is not necessary here to enter into a particular detail of the life and actions of Jesus Christ. Every one knows, that his life was one continued scene of the most perfect fanctity, and the purest and most active virtue; not only without fpot, but also beyond the reach of fuspicion. And it is also well known, that by miracles of the most stupendous kind, and not more flupendous than falutary and beneficent, he difplayed to the universe the truth of that religion which he brought with him from above, and demonstrated the reality of his divine commission in the most illustrious manner. For the propagation of his religion through the country of Judæa, our Saviour chose 12

after their return kept them conflantly about his perfon. But, befides thefe, he chofe other 70, whom he difperfed throughout the country.

There have been many conjectures concerning the reason why the number of apostles was fixed at 12, and that of the other teachers at 70. The first, however, was, according to our Saviour's own words (Matt. xix. 28.), an allufion to the 12 tribes of Ifrael, thereby intimating that he was the king of thefe 12 tribes; and as the number of his other messengers answers evidently to that of the fenators who composed the Sanhedrim, there is a high degree of probability in the conjecture of those who think that Christ by this number defigned to admonish the Tews, that the authority of their Sanhedrim was now at an end, and that all power with respect to religious matters was vested in him alone. His ministry, however, was confined to the Jews; nor, while he remained upon earth, did he permit his apoftles or disciples to extend their labours beyond this favoured nation. At the fame time, if we confider the illustrious acts of mercy and benevolence that were performed by Chrift, it will be natural to conclude, that his fame must foon have fpread abroad in other countries. Indeed this feems probable from a passage in scripture, where we are told that fome Greeks applied to the apostle Philip in order to fee Jefus. We learn also from authors of no fmall note, that Abgarus + king of Edeffa, being feized + See Abwith a fevere and dangerous illness, wrote to our Lord, garus. imploring his affiftance; and that Jefus not only fent him a gracious answer, but also accompanied it with his picture, as a mark of his efteem for that pious prince. These letters are still extant; but by the judicious part of mankind are univerfally looked upon as spurious; and indeed the late Mr Jones, in his treatife entitled A new and full method of fettling the canonical authority of the New Testament, hath offered reasons which seem almost unanswerable against the authenticity of the whole transaction.

The preaching of our Saviour, and the numberless miracles he performed, made fuch an impression on the body of the Jewish nation, that the chief priests and leading men, jealous of his authority, and provoked at his reproaching them with their wicked lives, formed a conspiracy against him. For a considerable time their defigns proved abortive; but at last Jesus, knowing that he had fulfilled every purpose for which he came into the world, fuffered himself to be taken through the treachery of one of his disciples, named Fudas Iscariot, and was brought before the Sanhedrim. In this affembly he was accused of blasphemy; and being afterwards brought before Pilate the Roman governor, where he was accused of sedition, Pilate was no fooner fat down to judge in this caufe, than he received a meffage from his wife, defiring him to have nothing to do with the affair, having that very day had a frightful dream on account of our Saviour, whom the called that just man. The governor, intimidated by this meffage, and still more by the majesty of our Saviour Himfelf, and the evident falsehood of the accusations brought against him, was determined if possible to save him. But the clamours of an enraged populace, who at last threatened to accuse Pilate himfelf as a traitor to the Roman emperor, got

occasions was not very fervent.

Our Saviour was now condemned by his judge, though contrary to the plainest dictates of reason and justice; was executed on a cross between two thieves, and very foon expired. Having continued three days in a state of death, he rose from the dead, and made himself visible to his disciples as formerly. He converfed with them 40 days after his refurrection, and employed himself during that time in instructing them more fully concerning the nature of his kingdom; and having manifelted the certainty of his refurrection to as many witnesses as he thought proper, he was, in the presence of many of his disciples, taken up into heaven, there to remain till the end of the world. See CHRISTIANITY.

JET, a black inflammable fubftance of the bituminous kind, harder than afphaltum, and susceptible of a good polish. It becomes electrical byrubbing, attracting light bodies like yellow amber. It fwims on water, fo that its specific gravity must be less than 1000; notwithstanding which it has been frequently confounded with the lapis obfidianus, the specific gravity of which, according to Kirwan, is no less than 1744. It also resembles cannel coal extremely in its hardness, receiving a polish, not foiling the fingers, &c. fo that it has also been confounded with this. The distinction, however, is eafily made betwixt the two; for cannelcoal wants the electrical properties of jet, and is likewife fo heavy as to fink in water; its specific gravity being no less than 1273; whereas that of jet, as has

already been faid, is less than 1000.

M. Magellan is of opinion that jet is a true amber, differing from the yellow kind only in the mere circumftance of colour, and being lighter on account of the greater quantity of bituminous matter which enters into its composition. When burning it emits a bituminous smell. It is never found in strata or continued maffes like fosfil stones; but always in feparate and unconnected heaps like the true amber. Great quantities of it have been dug up in the Pyrenæan mountains; also near Batalka, a small town of Portugal; and in Galicia in Spain. It is found also in Ireland, Sweden, Prussia, Germany, and Italy. It is used in making small boxes, buttons, bracelets, mourning jewels, &c. Sometimes also it is employed in conjunction with proper oils in making varnishes. When mixed with lime in powder, it is faid to make an extraordinary hard and durable cement.

FET-d' Eau, a French term, frequently also used with us, for a fountain that casts up water to a confiderable height in the air. See Hydrostatics,

n° 27.; and ICELAND, n° 3. 4.

JETTY-HEAD, a name usually given in the royal dockyards to that part of a wharf which projects beyond the rest; but more particularly the front of a wharf, whose fide forms one of the cheeks of a dry or wet dock.

JEWEL, any precious stone, or ornament beset with them. See DIAMOND, RUBY, &c.

JEWELS made a part of the ornaments with which the Jews, Greeks and Romans, especially their ladies of diffinction, adorned themselves. So prodigious was the extravagance of the Roman ladies, in particular, that Pliny the elder fays he faw Lollio Paulina with an equipage of this kind amounting, according to Dr

the better of his love of justice, which indeed on other Arbuthnot's calculation, to 322,016l. 128. 4d. of our Jewel. money. It is worthy of observation, that precious stones amongst the Romans and all the ancients were much scarcer, and confequently in higher esteem, than they are amongst us, fince a commerce has been opened with the Indies .- The ancients did not know how to cut and polish them to much perfection; but coloured ftones were not fcarce, and they cut them very well either hollow or in relief .- When luxury had gained ground amongst them, the Romans hung pendants and pearls in their ears; and for this purpose the ears of both fexes were frequently bored. See EARS.

JEWEL (John), a learned English writer and bishop, was born in 1522, and educated at Oxford. In 1;40 he proceeded A B. became a noted tutor, and was foon after chosen rhetoric lecturer in his college. In February 1544, he commenced A. M. He had early imbibed Protestant principles, and inculcated the same to his pupils; but this was carried on privately till the accession of King Edward VI. in 1546, when he made a public declaration of his faith, and entered into a close friendship with Peter Martyr, who was made professor of divinity at Oxford. In 1550, he took the degree of B. D. and frequently preached before the university with great applause. At the same time he preached and catechifed every other Sunday at Sunningwell in Berkshire, of which church he was rector. Upon the accession of Queen Mary to the crown in 1553, he was one of the first who felt the rage of the storm then raised against the reformation : for before any law was made, or order given by the queen, he was expelled Corpus Christi college by the fellows, by their own private authority; but he continued in Oxford till he was called upon to subscribe to some of the Popish doctrines, under the severest penalties, which he fubmitted to. However, this did not procure his fafety; for he was obliged to fly, and, after encountering many difficulties, arrived at Franckfort, in the 2d year of Queen Mary's reign, where he made a public recantation of his fubscription to the Popish doctrines. Thence he went to Strafburg, and afterwards to Zurich, where he attended Peter Martyr, in whose house he resided. He returned to England in 1558, after Queen Mary's death; and in 1559, was confecrated bishop of Salisbury. This promotion was given him as a reward for his great merit and learning; and another attestation of these was given him by the university of Oxford, who, in 1565, conferred on him in his absence the degree of D. D. In this character he attended the queen to Oxford the following year, and prefided at the divinity-difputations held before her majesty on that occasion. He had before greatly diftinguished himself by a sermon preached at St Paul's-cross, presently after he was made a bishop, wherein he gave a public challenge to all the Roman catholics in the world, to produce but one clear and evident testimony out of any father or famous writer, who flourished within 600 years after Chirft, for any one of the articles which the Romanifts maintain against the church of England; and, two years afterwards, he published his famous apology for this church. In the mean time, he gave a partis cular attention to his diocefe; where he began in his first visitation, and persected in his last, such a reformation, not only in his cathedral and parochial churches, Jewel. churches, but in all the churches of his jurifdiction, as mity of the main and fore top-fail yards, by means of Jews. procured him and the whole order of bishops due reverence and esteem. For he was a careful overlooker and strict observer, not only of all the flocks, but also of the paftors, in his diocefe; and he watched fo narrowly upon the proceedings of his chancellor and archdeacons, and of his flewards and receivers, that they had no oportunities of being guilty of oppression, injustice, or extortion, nor of being a burden to the peo-ple, or a fcandal to himself. To prevent these and the like abuses, for which the ecclesiastical courts are often too justly censured, he sat often in his consistorycourt, and faw that all things were carried rightly there: he also sat often as assistant on the bench of civil justice, being himself a justice of the peace. A midst these employments, however, the care of his health was too much neglected; to which, indeed, his general courfe of life was totally unfavourable. He rose at four o'clock in the morning; and, after prayers with his family at five, and in the cathedral about fix, he was fo fixed to his studies all the morning, that he could not without great violence be drawn from them. After dinner, his doors and ears were open to all fuitors; and it was observed of him, as of Titus, that he never fent any fad from him. Suitors being thus difmiffed, he heard, with great impartiality and patience, fuch causes debated before him, as either devolved to him as a judge, or were referred to him as an arbitrator; and if he could spare any time from these, he reckoned it as clear gain to his fludy. About nine at night he called all his fervants to an account how they had fpent the day, and he went to prayers with them. From the chapel he withdrew again to his fludy till near midnight, and from thence to his bed; in which when he was laid, the gentleman of his bed-chamber read to him till he fell afleep. This watchful and laborious life, without any recreation at all, except what his necessary refreshment at meals and a very few hours of rest afforded him, wasted his life too fast. He died at Monkton-Farley, in 1571, in the 50th year of his age. He wrote, I. A view of a feditious bull fent into England by Pope Pius V. in 1569. 2. A treatife on the Holy Scriptures. 3. An exposition of St Paul's two epistles to the Thessalonians. 4. A treatise on the facrament. 5. An apology for the national church. 6. Several fermons, controverfial treatifes, and other works.

"This excellent prelate (fays the Rev. Mr Granger) was one of the greatest champions of the reformed religion, as he was to the church of England what Bellarmine was to that of Rome. His admirable Apology was translated from the Latin by Anne, the second of the four learned daughters of Sir Anthony Coke, and mother of Sir Francis Bacon. It was published, as it came from her pen, in 1564, with the approbation of the queen and the prelates. The same Apology was printed in Greek at Constantinople, under the direction of St Cyril the patriarch. His Defence of his Apology, against Harding and other Popish divines, was in such esteem, that Queen Elizabeth, King James I. King Charles I. and four successive archbishops, ordered it to be kept chained in all parishchurches for public use.

FEWEL-Blocks, in the fea-language, a name given to two fmall blocks which are suspended at the extre-Nº 164.

an eye-bolt driven from without into the middle of the yard-arm, parallel to its axis. The use of these blocks is, to retain the upper-part of the top-mast studding-fails beyond the skirts of the top-fails, fo that each of those fails may have its full force of action, which would be diminished by the encroachment of the other over its furface. The haliards, by which those studding-fails are hoisted, are accordingly passed through the jewel-blocks; whence, communicating with a block on the top-mast head, they lead downwards to the top or decks, where they may be conveniently hoisted. See SAIL.

IEWS, a name derived from the patriarch Indah. and given to the descendants of Abraham by his cldeit fon Isaac, who for a long time possessed the land of Palestine in Asia, and are now dispersed through all

nations in the world.

The history of this people, as it is the most fingular, fo is it also the most ancient in the world; and the greatest part being before the beginning of profane history, depends entirely on the authenticity of the Old Testament, where it is only to be found .- To repeat here what is faid in the facred writings would both be superfluous and tedious, as those writings are in every persons hands, and may be consulted at pleafure. It feems most proper therefore to commence the history of the Jews from their return to Jerusalem from Babylon, and the rebuilding of their city and temple under Ezra and Nehemiah, when the fcripture leaves off any farther accounts, and profane historians begin to take notice of them. We shall, however, premife a chronological lift of their judges and kings down to the captivity.

The Ifraelites had no king of their nation till Saul. Before him, they were governed, at first by elders, as in Egypt; then by princes of God's appointment, as Mofes and Joshua; then by judges, such as Othniel, Ehud, Shamgar, Gideon, Jephthah, Samfon, Elia Samuel; and last of all by kings, as Saul, David, So-

lomon, Rehoboam, &c.

A lift of the Judges of Ifrael in a chronological order. The numbers prefixed denote the years of the world.

2570. THE death of Joshua.

2585. The government of the elders for about 15

2592. An anarchy of about feven years. The history of Micah, the conquest of the city of Laish, by part of the tribe of Dan, and the war undertaken by the 11 tribes against Benjamin, are all referred to this time.

2501. The first fervitude under Cushan-rishathaim king of Mesopotamia, began in 2591, and lasted

eight years to 2599. 2599. Othniel delivered Ifrael in the 40th year after peace established in the land by Joshua.

2662. A peace of about 62 years, from the deliverance procured by Othniel, in 2599, to 2662, whenthe fecond fervitude under Eglon king of the Moabites happened. It lasted 18 years.

2679. Ehud delivers Ifrael.

After him Shamgar governed, and the land was in peace till the 80th year after the first deliverance procured by Othniel.

120

2600. The third fervitude under the Canaanites, which lasted 20 years, from 2699 to 2719.

2719. Deborah and Barak deliver the Ifraelites: from the deliverance procured by Ehud to the end of Deborah and Barak's government, were 40

2768. Abimelech the natural fon of Gideon is acknow-

ledged king by the Shechemites. 2771. He died at the fiege of Thebez in Paleftine. 2772. Tola after Abimelech governs for 23 years, from

2772 to 2795. 2795. Jair fucceeds Tola, and governs 22 years, from

2799. The fifth fervitude under the Philiftines, which lasted 18 years, from 2799 to 2817.

2817. The death of Jair.

2817. Jephthah is chosen head of the Israelites beyond Iordan, he defeated the Ammonites, who oppressed them. Jephthah governed fix years, from 2817 to 2823.

2823. The death of Jephthah.

28 to. Ibzan governs feven years, from 2823 to 2830. 2840. Elon fucceeds Ibzan. He governs from 2830

to 2840.

Abdon judges Ifrael eight years, from 2840 to 2848.

2848. The fixth fervitude, under the Philiftines, which latted 40 years, from 2848 to 2888

2848. Eli the high priest, of the race of Ithamar, governed 40 years, the whole time of the fervitude under the Philistines.

2849. The birth of Samson.

2887. The death of Samfon, who was judge of Ifrael during the judicature of Eli the high prieft. 2888. The death of Eli, and beginning of Samuel's go-

vernment, who fucceeded him.

2000. The election and anointing of Saul, first king of the Hebrews.

A chronological lift of the kings of the Hebrews.

SAUL, the first king of the Israelites, reigned 40 years, from the year of the world 2909 to 2949.

Ishbosheth the son of Saul succeeded him, and reigned fix or feven years over part of Ifrael, from 2040

David was anointed king by Samuel in the year of the world 2934, but did not enjoy the regal power till the death of Saul in 2049, and was not acknowledged king of all Ifrael till after the death of Ishbosheth in 2956. He died in 2990 at the age of 70.

Solomon his fon fucceeded him; he received the royal unction in the year 2989. He reigned alone after the death of David in 2990 He died in 3029, after

a reign of 40 years.

After his death, the kingdom was divided; and the ten tribes having chosen Jeroboam for their king, Rehoboam, the fon of Solomon. reigned only over the tribes of Judah and Benjamin.

The Kings of Judah.

Rehobeam, the fon and fucceffor of Solomon, reigned 17 years; from the year 3029 to 3046.

Abijam, three years, from 3046 to 3049. Afa 41 years, from 3049 to 3090. Jehoshaphat, 25 years, from 3090 to 3115.

Jehoram, four years, from 3115 to 2119.

Vol. IX. Part I.

Ahaziah, one year, from 3119 to 3120.

Athaliah, his mother, reigned fix years, from 3120 to 3126.

Joath was fet upon the throne by Jehoiada the high-priest, in 3126. He reigned 40 years, to the year

Towe.

Amaziah, 29 years, from 3165 to 3194.

Uzziah, otherwise called Azariah, reigned 27 years, to the year 3221. Then attempting to offer incense in the temple, he was firuck with a leprofy, and obliged to quit the government. He lived after this 26 years, and died in 3246.

Jotham his fon took upon him the government in the year of the world 3221. He reigned alone in 3246. and died in 3262.

Ahaz succeeded Jotham in the year of the world 3262. He reigned 16 years, to 3278.

Hezekiah, 28 years, from 3278 to 3306.

Manasseh, 55 years, from the year of the world, 3306 to 3361.

Amon, 2 years, from 3361 to 3363.

Jofiah, 31 years, from 3363 to 3394. Ichoahaz, three months.

Eliakim, or Jehoiakim, 11 years, from the year 3394 to 3405.

Jehoiachin, or Jechoniah, reigned three months and ten days, in the year 3405

Mattaniah, or Zedekiah, reigned 11 years, from 3405 to 3416. In the last year of his reign Jerusalam was taken, the temple burnt, and Judah carried into captivity, beyond the Euphrates.

Kings of Ifrael. Jeroboam reigned 22 years, from 3029 to 3051.

Nadab, one year. He died in 3051. Baasha, 22 years, from 3052 to 3074. Elah, two years. He died in 2075.

Zimri, feven days.

Omii, 11 years, from 3075 to 3086. He had a competitor Tibni who fucceeded, and died in what year we know not.

Ahab, 21 years, from 3086 to 3107. Ahaziah, two years, from 3106 to 3108.

Jehoram, the fon of Ahab, succeeded him in 3108. He reigned 12 years, and died in 3120.

Jehu usurped the kingdom in 3120, reigned 28

years, and died in 3148.

Jehoahaz reigned 17 years, from 3148 to 3165. Joash reigned 14 years, from 3165 to 3179.

Jeroboam II. reigned 41 years, from 3179 to 3220.

Zachariah, 12 years, from 3220 to 3232. Shallum, reigned a month. He was killed in 3233.

Menahem, 10 years, from 3233 to 3243 Pekahiah, two years, from 3243 to 3245.

Pekah, 20 years, from 3245 to 3265.

Hoshea, 18 years, from 3265 to 3283. Here the kingdom of Israel had an end after a duration of 253 years.

Cyrus the Great, king of Persia, having conquered Cyrus pub-Babylon and almost all the western parts of Asia, per-lishes a deceiving the defolate and ruinous condition in which cree for rethe province of Palestine lay, formed a design of re- Jerusalema floring the Jews to their native country, and permit-

ting them to rebuild Jerufalem and re-establish their worthip. For this purpose he issued out a decree in the first year of his reign, about 536 B. C. by which they

were allowed not only to return and rebuild their city. but to carry along with them all the facred veffels which Nebuchadnezzar had carried off, and engaged to defray the expence of building the temple himfelf. This offer was gladly embraced by the more zealous Jews of the tribes of Judah, Benjamin, and Levi; but many more, being no doubt less fanguine about their religion chofe to flay where they were.

In 534 B. C. the foundations of the temple were laid, and matters feemed to go on prosperously, when the undertaking was fuddenly obstructed by the Samaritans. These came at first expressing an earnest defire to affift in the work, as they worshipped the fame God with the Iews; but the latter refused their affiftance, as they knew they were not true Ifraelites, but the descendants of those heathers who had been transplanted into the country of the ten tribes after their captivity by Shalmanezer. This refufal proved the fource of all that bitter enmity which afterwards took place between the Jews and Samaritans; and the immediate confequence was, that the latter made all the opposition in their power to the going on of the work. At last, however, all obstacles were fur-The temple books of Ezra and Nehemiah. The last of these chiefs died about 409 B. C. after having restored the Jewish worship to its original purity, and reformed a number of abuses which took place immediately on its

commencement.

ferred on the high-

priefts.

exercife of religion, they were neither a free nor a powerful people as they had formerly been. They were few in number, and their country only a pro-vince of Syria, fubject to the kings of Perfia. The Syrian governors conferred the administration of affairs upon the high-priefts; and their accepting this office, and thus deviating from the law of Mofes, must be confidered as one of the chief causes of the misfortunes which immediately befel the people, because it made room for a fet of men who afpired at this high office merely through ambition or avarice, without either zeal for religion or love for their country. It belides made the high-priefthood capable of being disposed of at the pleasure of the governors, whereas the Mosaic institution had fixed it unalienably in the family of Aaron.-Of the bad effects of this practice a fatal instance happened in 373 B. C. Bagoses, governor of Syria, having contracted an intimate friendship with Jeshua the brother of Johanan the highprieft, promifed to raife him to the pontifical office a few years after his brother had been invefted with it. Jeshua came immediately to Jerusalem, and acquainted his brother with it. Their interview happened in the inner court of the temple; and a fcuffle

But though the Jews were now reftored to the free

The first public calamity which befel the Jewish nation after their restoration from Babylon, happened in the year 351 B. C.; for having some how or other disobliged Darius Ochus king of Persia, he besieged and took Jericho, and carried off all the inhabitants eaptives. From this time they continued faithful to

enfuing, Jeshua was killed by his brother, and the

temple thus polluted in the most fcandalous manner. The confequence to the Jews was, that a heavy fine

was laid on the temple, which was not taken off till

the Persians, infomuch that they had almost drawn upon themfelves the displeasure of Alexander the Great. That monarch having resolved upon the siege of Tyre, and being informed that the city was wholly supplied with provisions from Judea, Samaria, and Galilee, fent to Jaddua, then high-prieft, to demand of him that fupply which he had been accustomed to pay to the Perfians. The Jewish pontiff excused himself on account of his oath of fidelity to Darius; which fo provoked Alexander, that he had no fooner completed the reduction of Tyre than he marched against Jerufalem. The inhabitants then, being with good reafon thrown into the utmost consternation, had recourse to prayers; and Jaddua is faid, by a divine revelation, to have been commanded to go and meet Alexander. He obeyed accordingly, and fet out on his journey, dreffed in his pontifical robes, at the of the highhead of all his priefts in their proper habits, and at-prieft with tended by the reft of the people dreffed in white gar- Alexander ments. Alexander is faid to have been feized with the Great. fuch awful respect on seeing this venerable procession, that he embraced the high-prieft, and paid a kind of religious adoration to the name of God engraven on the front of his mitre. His followers being furprifed at this unexpected behaviour, the Macedonian monarch informed them, that he paid that respect not to the prieft, but to his God, as an acknowledgment for a vision which he had been favoured with at Dia; where he had been promifed the conquest of Perfia, and encouraged in his expedition by a perfon of much the same aspect and dressed in the same habit with the pontiff before him. He afterwards accompanied Jaddua into Jerufalem, where he offered facrifices in the temple. The high-prieft showed him also the prophecies of Daniel, wherein the destruction of the Persian empire by himself is plainly fet forth; in confequence of which the king went away highly fatisfied, and at his departure asked the high-priest if there was nothing in which he could gratify himfelf or his people. Jaddua then told him, that, according to the Mosaic law, they neither sowed nor ploughed on the seventh year; therefore would esteem it an high favour if the king would be pleafed to remit their tribute in that year. To this request the king readily yielded; and having confirmed them in the enjoyment of all their privileges, particularly that of living under their own laws, he departed.

Whether this story deserves credit or not (for the whole transaction is not without reason called in queftion by fome), it is certain that the Jews were much favoured by Alexander; but with him their good fortune feemed also to expire. The country of Judea being fituated between Syria and Egypt, became fub-Miferable ject to all the revolutions and wars which the ambi- flate of the tious fuccesfors of Alexander waged against each other. Jews after At first it was given, together with Syria and Phenicia, to Leomedon the Mitylenian, one of Alexander's generals; but he being foon after stripped of the other two by Ptolemy, Judea was next fummoned to yield to the conqueror. The Jews scrupled to break their oath of fidelity to Leomedon; and were of confequence invaded by Ptolemy at the head of a powerful army. The open country was eafily reduced; but the city being strongly fortified both by art and nature, threatened a strong refistance. A superstitious

fear for breaking the fabbath, however, prevented the befieged from making any defence on that day; of which Ptolemy being informed, he caused an affault to be made on the fabbath, and eafily carried the place. At first he treated them with great severity, and carried 100,000 men of them into captivity; but reflecting foon after on their known fidelity to their conquerors, he restored them to all the privileges they had enjoyed under the Macedonians. Of the captives he put some into garrisons, and others he fettled in the countries of Libva and Cyrene. From those who settled in the latter of these countries defeended the Cyrenean Jews mentioned by the writers

of the New Testament.

Five years after Ptolemy had fubdued Judea, he was forced to yield it to Antigonus, referving to himfelf only the cities of Ace, Samaria. Joppa, and Gaza; and carrying off an immense booty, together with a great number of captives, whom he fettled at Alexandria, and endowed with confiderable privileges and immunities .- Antigonus behaved in fuch a tyrannical manner, that great numbers of his Jewish subjects fled into Egypt, and others put themselves under the protection of Seleucus, who also granted them confiderable privileges. Hence this nation came gradually to be spread over Syria and Asia Minor; while Judea feemed to be in danger of being depopulated till it was recovered by Polemy in 292. The affairs of the Jews then took a more profperous turn, and continued in a thriving way till the reign of Ptolemy Philopator, when they were grievously oppressed by the incursions of the Samaritans, at the same time that Antiochus Theos king of Syria invaded Galilee. Ptolemy, however, marched against Antiochus, and defeated him; after which, having gone to Jerusalem to offer facrifices, he ventured to profanc the temple itself by going into it. He penetrated through the two outer courts ; but as he was about to enter the fanctuary, he was ftruck with fuch dread and terror that he fell down half-dead. A dreadful perfecution was then raifed against the Jews, who had attempted to hinder him in his impious attempt; but this perfecution was flopped by a ftill more extraordinary accident related under the article EGYPT, no 30. and the Jews again received into

About the year 204 B. C the country of Judea was Subdued by fubdued by Antiochus the Great; and on this occathe Great. fron the loyalty of the Jews to the Egyptians failed them, the whole nation readily fubmitting to the king of Syria. This attachment fo pleafed the Syrian monarch, that he fent a letter to his general, wherein he acquainted him that he defigned to reftore Jerufalem to its ancient splendor, and to recal all the Jews that had been driven out of it: that out of his fingular refpect to the temple of God, he granted them 20,000 pieces of filver, towards the charges of the victims, frankincense, wine, and oil; 1400 measures of fine wheat, and 375 measures of falt, towards their usual oblations: that the temple should be thoroughly repaired at his coft; that they should enjoy the free exercife of their religion; and reftore the public fervice of the temple, and the priefts, Levites, fingers, &c. to their usual functions: that no stranger, or Jew that was unpurified, should enter farther into the temple than was allowed by their law; and that no flesh of unclean

beafts should be brought into Jerusalem : not even their Tewe. fkins: and all these under the penalty of paying 3000 pieces of filver into the treasury of the temple. He further granted an exemption of taxes for three years to all the dispersed Jews that should come within a limited time to fettle in the metropolis; and that all who had been fold for flaves within his dominions should be immediately fet free.

This fudden prosperity proved of no long duration, preadful About the year 176, a quarrel happened between commo-Onias at that time high prieft, and one Simon, gover tions. nor of the temple, which was attended with the most fatal confequences. The causes of this quarrel are unknown. The event, however, was, that Simon finding he could not get the better of Onias, informed Apollonius governor of Cœlosyria and Palestine, that there was at that time in the temple an immense treasure. which at his pleasure might be seized upon for the use of the king of Syria. Of this the governor inflantly fent intelligence to the king, who dispatched one Heliodorus to take possession of the supposed treasure. This person, through a miraculous interposition, as the Jews pretend, failed in his attempt of entering the temple; upon which Simon accused the high-priest to the people, as the person who had invited Heliodorna to Jerusalem. This produced a kind of civil war, in which many fell on both fides. At last Onias having complained to the king, Simon was banished; but soon after, Antiochus Epiplianes having afcended the throne of Syria, Jason, the high-priest's brother, taking advantage of the necessities of Antiochus, purchased from him the high-priesthood at the price of 350 talents, and obtained an order that his brother should be fent to Antioch, there to be confined for life.

Jason's next step was to purchase liberty, at the price of 150 talents more, to build a gymnafium at Jerufalem similar to those which were used in the Grecian cities; and to make as many Jews as he pleafed free citizens of Antioch. By means of these powers he became very foon able to form a ftrong party in Judea; for his countrymen were exceedingly fond of the Grecian customs, and the freedom of the city of Antioch was a very valuable privilege. From this time therefore a general apoltacy took place; the fervice of the A general temple was neglected, and Jason abandoned himself takes place. without remorfe to all the impieties and absurdities of

paganism.

He did not, however, long enjoy his ill acquired dignity. Having fent his brother Menelaus with the usual tribute to Antiochus, the former took the opportunity of fupplanting Jason in the same manner that he had supplanted Onias. Having offered for the highpriesthood 300 talents more than his brother had given, he eatily obtained it, and returned with his new commission to Jerusalem. He soon got himself a strong party; but Jason proving too powerful, forced Menelaus and his adherents to retire to Antioch. Here, the better to gain their point, they acquainted Antiochus that they were determined to renounce their old religion, and wholly conform themselves to that of the Greeks: which fo pleafed the tyrant, that he immediately gave them a force fufficient to drive Jason out of Jerusalem; who thereupon took refuge among the Ammonites

Menelaus being thus freed from his rival, took care R 2

to fulfil his promife to the king with regard to the a- king, who, having by his means plundered the temple. Tews postacy, but forgot to pay the money he had promised. At last he was summoned to Antioch; and finding nothing but the payment of the promifed fum would do. fent orders to his brother Ly Gmachus to convey to him as many of the facred utenfils belonging to the temple as could be spared. As these were all of gold, the apostate soon raised a sufficient sum from them, not only to fatisfy the king, but also to bribe the courtiers in his favour. But his brother Onias, who had been all this time confined at Antioch, getting intelligence of the facrilege, made fuch bitter complaints, that an infurrection was ready to take place among the Jews at Antioch. Menelaus, in order to avoid the impending danger, bribed Andronicus, governor of the city, to murder Onias. This produced the most vehement complaints as foon as Antiochus returned to the capital (he having been absent for some time in order to quell an infurrection in Cilicia); which at last ended in the death of Andronicus, who was executed by the king's order. By dint of money, however, Menelaus ftill found means to keep up his credit; but was obliged to draw fuch large fums from Jerusalem, that the inhabitants at last massacred his brother Lysimachus, whom he had left governor of the city in his absence. Antiochus foon after took a journey to Tyre; upon which the Jews fent deputies to him, both to justify the death of Lyfimachus, and to accuse Menelaus of being the author of all the troubles which had happened. The apostate, however, was never at a loss while he could procure money. By means of this powerful argument he pleaded his cause so effectually, that the deputies were not only cast, but put to death; and this unjust fentence gave the traitor such a complete victory over all his enemies, that from thenceforth he commenced a downright tyrant. Jerusalem was destitute of protectors; and the fanhedrim, if there were any zealous men left among them, were fo much terrified, that they durst not oppose him, though they evidently faw that his defign was finally to eradicate the religion and liberties of his country.

In the mean time, Antiochus was taken up with the conquest of Egypt, and a report was some how or other fpread that he had been killed at the fiege of Alexandria. At this news the Jews imprudently showed some figns of joy; and Jason thinking this a proper opportunity to regain his loft dignity, appeared before Jerusalem at the head of about 1000 resolute men. The gates were quickly opened to him by fome of his friends in the city; upon which Menelaus retired into the citadel, and Jason, minding nothing but his refentment, committed the most horrid butcheries. At last he was obliged to leave both the city and country, on the news that Antiochus was coming with a powerful army against him; for that prince, highly provoked at this rebellion, and especially at the rejoicings the Jews had made on the report of his death, had actually refolved to punish the city in the severest manner. Accordingly, about 170 B. C. having made himfelf mafter of the city, he behaved with fuch cruelty, that within three days they reckoned no fewer than 40,000 killed, and as many fold for flaves. In the midft of this dreadful calamity, the apostate Menclaus found means not only to preserve himself from the general flaughter, but even to regain the good graces of the

of every thing valuable, returned to Antioch in a kind of triumph. Before he departed, however, he put Iudea under the government of one Philip, a barbarous-Phrygian: Samaria under that of Andronicus, a perfon of a fimilar disposition; and left Menelans, the most hateful of all the three, in possession of the high-priest-Though the Jews fuffered exceedingly under thefe Hi mon-

tyrannical governors, they were fill referred for greater from calamities. About 168 B. C. Antiochus having been cruelty. most severely mortified by the Romans, took it into his head to wreak his vengeance on the unhappy Jews. For this purpose he dispatched Apollonius at the head of 22,000 men, with orders to plunder all the cities of Judea, to murder all the men, and fell the women and children for flaves. Apollonius accordingly came with his army, and to outward appearance with a peaceable. intention; neither was he suspected by the Jews, as he was fuperintendant of the tribute in Palettine. Hekept himself inactive till the next sabbath, when they. were all in a profound quiet; and then, on a fudden, commanded his men to arms. Some of them he fent to the temple and fynagogues, with orders to cut in pieces all whom they found there; whilk the reft going through the ftreets of the city maffacred all that came in their way; the superstitious Jews not attempting to make the least relistance for fear of breaking the fabbath. He next ordered the city to be plundered and fet on fire, pulled down all their flately buildings, caused the walls to be demolished, and carried away captive about 10,000 of those who had escaped the flaughter. From that time the service of The temple the temple was totally abandoned; that place having profaned been quite polluted, both with the blood of multitudes and the who had been killed, and in various other ways. The ligion abo-Syrian troops built a large fortress on an eminence in listed. the city of David; fortified it with a strong wall and stately towers, and put a garrison in it to command the temple over-against which it was built, so that the foldiers could eafily fee and fally out upon all those who attempted to come into the temple; fo many of whom were continually plundered and murdered by them, that

Antiochus, not yet satiated with the blood of the Jews, refolved either totally to aboluh their religion, or destroy their whole race. He therefore issued out a decree that all nations within his dominions should forfake their old religion and gods, and worship those of the king under the most severe penalties. To make his orders more effectual, he fent overfeers into every province to fee them firictly put in execution; and as he knew the Jews were the only people who would difobey them, special directions were given to have themtreated with the utmost feverity. Atheneas, an old and cosel minister, well versed in all the pagan rites, was fent into Iudea. He began by dedicating the temple to Jupiter Olympius, and fetting up his statue on the altar of burnt-offerings. Another leffer altar was raifed before it, on which they offered facrifices to that falle deity. All who refused to come and worship this idol were either massacred or put to some cruel tortures till they either complied or expired under the hands of the executioners. At the fame time, altars,

the rest, not daring to stay any longer in Jerusalem, sled

for refuge to the neighbouring nations.

Jerufalem taken by Antiochus groves, and flatues, were raifed every where through the country, and the inhabitants compelled to worship them under the fame fevere penalties; while it was inflant death to observe the sabbath, circumcision, or any other institution of Moses.

At last, when vait numbers had been put to cruel

Reflored by deaths, and many more had faved their lives by their Mattathias, apoffacy, an eminent prieft, named Mattathias, began to fignalize himfelf by his bravery and zeal for religion. He had for fome time been obliged to retire to Modin his native place, in order to avoid the perfecution which raged at Jerusalem. During his recess there, Apelles, one of the king's officers, came to oblige the inhabitants to comply with the abovementioned orders. By him Mattathias and his fons were addressed in the most earnest manner, and had the most ample promises made them of the king's favour and protection if they would renounce their religion. But Mattathias answered, that though the whole Jewish nation, and the whole world, were to conform to the king's edict, yet both he and his fons would continue faithful to their God to the last minute of their lives. At the same time perceiving one of his countrymen just going to offer facrifices to an idol, he fell upon him and inftantly killed him, agreeable to the law of Mofes in fuch cases. Upon this his fons, fired with the fame zeal, killed the officer and his men; overthrew the altar and idol; and running about the city, cried out, that those who were zealous for the law of God should follow them; by which means they quickly faw themselves at the head of a numerous troop, with whom they foon after withdrew into some of the deserts of Judea. They were followed by many others, fo that in a short time they found themselves in a condition to refift their enemies; and having confidered the danger to which they were exposed by their ferupulous observance of the fabbath, they resolved to defend themselves, in case of an attack, upon that day as well as upon any other.

> In the year 167 B. C. Mattathias finding that his followers daily increased in number, began to try his ftrength by attacking the Syrians and apostate Jews. As many of these as he took he put to death, but forced a much greater number to fly for refuge into foreign countries; and having foon flruck his enemies with terror, he marched from city to city, overturned the idolatrous altars, opened the Jewish synagogues, made a diligent fearch after all the facred books, and caufed fresh copies of them to be written; he also caufed the reading of the Scriptures to be refumed, and all the males born fince the perfecution to be circumcifed. In all this he was attended with fuch fuccess, that he had extended his reformation through a confiderable part of Judea within the space of one year; and would pro-, bably have completed it, had he not been prevented by

cabeus.

Mattathias was fucceeded by his fon Judas, furna-Exploits of med Maccabeus, the greatest uninspired hero of whom Judas Mac the Jews can boast. His troops amounted to no more than 6000 men; yet with thefe he quickly made himfelf master of fome of the strongest fortresses of Judea, and became terrible to the Syrians, Samaritans, and apostate Jews. In one year he defeated the Syrians in five pitched battles, and drove them quite out of the country; after which he purified the temple, and reflored the true worship, which had been interrupted for three years and a half. Only one obstacle now remained, viz. the Syrian garrifon above mentioned. which had been placed over against the temple, and which Judas could not at prefent reduce. In order to prevent them from interrupting the worship, howeverhe fortified the mountain on which the temple flood. with an high wall and strong towers round about, leaving a garrifon to defend it; making fome additional fortifications at the same time to Bethzura, a fortress at about 20 miles diffance. In the mean time Antiochus being on his return

from an unsuccessful expedition into Persia, received the difagreeable news that the Jews had all to a manrevolted, defeated his generals, driven their armies out of Judea, and restored their ancient worship. This threw him into fuch a fury, that he commanded his charioteer to drive with the utmost speed, threatening utterly to extirpate the lewish race, without leaving a fingle person alive. These words were scarce uttered, when he was feized with a violent pain in his bowels, Dreadful-which no remedy could cure or abate. But notwith death of flanding this violent shock, fuffering himself to be hur- Antiochus ried away by the transports of his fury, he gave orders Epiphanes.

for proceeding with the fame precipitation in his journey. But while he was thus haftening forward, he fell from his chariot, and was fo bruifed by the fall, that his attendants were forced to put him into a litter. Not being able to bear even the motion of the litter, he was forced to halt at a town called Tabe on the confines of Persia and Babylonia. Here he kept his bed, fuffering inexpreffible torments, occasioned chiefly by the vermin which bred in his body, and the stench, which made him insupportable even to himself. But the torments of his mind, caused by his reflecting on the former actions of his life, furpaffed by many degrees those of his body. Polybius, who in his account of this prince's death agrees with the Jewish hiflorians, tells us, that the uneafiness of his mind grew at last to a constant delirium or state of madness, by reason of several spectres and apparitions of evil genii or spirits, which he imagined were continually reproaching him with the many wicked actions of which he had been guilty. At last, having languished for fome time in this miferable condition, he expired, and by his death freed the Jews from the most inveterate enemy they had ever known.

Nothwithstanding the death of Antiochus, however, the war was still carried on against the Jews; but through the valour and good conduct of Judas, the Syrians were constantly defeated, and in 163 B. C. a peace was concluded upon terms very advantageous to the Jewish nation. This tranquillity, however, was of no long continuance; the Syrian generals renewed their hostilities, and were attended with the fame ill fuccess as before. Judas defeated them in five engagements; but in the fixth was abandoned by all his men except 800, who, together with their chief, were flain in the year 161 B. C

The news of the death of Judas threw his country- Exploits of men into the utmost consternation, and seemed to give Jonathan, new-life to all their enemies. He was succeeded, how simon, and ever, by his brother Jonathan; who conducted matters with no less prudence and fuccess than Judas had done, till he was treacheroufly feized and put to death by Tryphon, a Syrian usurper, who shortly after nurdered his own sovereign. The traitor immediately prepared to invade Judea; but found all his projects

fruftrated.z

frustrated by Simon, Jonathan's brother. This pontiff as long as she lived: but as he saw her greatly asraid, Jews. repaired all the fortreffes of Judea, and furnished them with fresh garrisons, took Joppa and Gaza, and drove out the Syrian garrison from the fortress of Jerufalem: but was at last treacherously murdered by a fonin-law named Ptolemy, about 135 B. C.

Simon was fucceeded by his fon Hyrean; who not only shook off the yoke of Syria, but conquered the Samaritans, demolished their capital city, and became mafter of all Palestine, to which he added the provinces of Samaria and Galilee; all which he enjoyed till within a year of his death, without the least disturbance from without, or any internal discord. His reign was no less remarkable on the account of his great wisdom and piety at home than his conquelts abroad. He was the first fince the captivity who had assumed the royal title; and he raifed the fewish nation to a greater degree of fplendor than it had ever enjoyed fince that time. The author of the fourth book of the Maccabees also informs us, that in him three dignities were centered which never met in any other person, namely, the royal dignity, the high-priefthood, and the gift of prophecy. But the inflances given of this last are very equivocal and suspicious. The last year of his reign, however, was imbittered by a quarrel with the Pharifees; and which proceeded such a length as was thought to have shortened his days. Hyrcan had al-ways been a great friend to that sect, and they had hitherto enjoyed the most honourable employments in the state; but at length one of them, named Eleazar, took it into his head to question Hyrcan's legitimacy, alleging, that his mother had formerly been a flave, and confequently that he was incapable of enjoying the high priesthood. This report was credited, or pretended to be fo, by the whole feet; which irritated the high-priest to such a degree, that he joined the Sadducees, and could never afterwards be reconciled to the Pharifees, who therefore raifed all the troubles and feditions they could during the short time he lived.

Hyrcan died in 107 B. C. and was succeeded by his eldeft fon Aristobulus, who conquered Iturea, but proved a most cruel and barbarous tyrant, polluting his hands with the blood even of his mother and one of his brothers, keeping the rest closely confined during his reign, which, however, was but faort. He was succeeded in 105 by Alexander Jannæus, the greatest conqueror, next to king David, that ever sat on the Jewish throne. He was hated, however, by the Pharifees, and once in danger of being killed in a tumult excited by them; but having caused his guards to fall upon the mutinous mob, they killed 6000 of them, and difperfed the reft. After this, finding it impossible to remain in quiet in his own kingdom, he left Jerusalem, with a design to apply himself wholly to the extending of his conquests; but while he was bufied in subduing his foreign enemies, the Pharifees raifed a rebellion at home. This was quashed in the year 86 B. C. and the rebels were treated in the most inhuman manner. The faction, however, was by this means fo thoroughly quelled, that they never dared to lift up their heads as long as he lived; and Alexander having made feveral conquetts in Syria, died about 79 B. C.

The king left two fons, Hyreanus and Aristobulus ; but bequeathed the government to his wife Alexandra

rifees, he defired his queen, just before his death, to Contests by fend for the principal leaders of that party, and pre-tween his tend to be entirely devoted to them; in which case, he fons Hyraffured her, that they would support her and her fons canus and Aristobuafter her in the peaceable possession of the government, his With this advice the queen complied; but found herfelf much embarraffed by the turbulent Pharifees, who. after feveral exorbitant demands, would at last be contented with nothing less than the total extermination of their adverfaries the Sadducees. As the queen was unable to refift the strength of the pharifaic faction, a most cruel perfecution immediately took place against the Sadducees, which continued for four years; until at laft, upon their earnest petition, they were disperfed among the feveral garrifons of the kingdom, in order to fecure them from the violence of their enemies. A few years after this, being seized with a dangerous fickness, her youngest son Aristobulus collected a strong party in order to fecure the crown to himself; but the queen, being displeased with his conduct, appointed her other fon Hyrcanus, whom the had before made high-prieft, to succeed her also in the royal dignity. Soon after this she expired, and left her two fons competitors for the crown. The Pharifees raifed an army against Aristobulus, which almost instantly deferted to him, fo that Hyrcanus found himfelf obliged to accept of peace upon any terms; which, however, was not granted, till the latter had abandoned all title both to the royal and pontifical dignity, and contented himfelf with the enjoyment of

But this deposition did not extinguish the party of Hyrcanus. A new cabal was raifed by Antipater an Idumæan profelyte, and father of Herod the Great ; who carried off Hyrcanus into Arabia, under pretence that his life was in danger if he remained in Judea. Here he applied to Aretas king of that country, who undertook to restore the deposed monarch; and for that purpose invaded Judea, defeated Aristobulus, and kept him closely befieged in Jerusalem. The latter The Ro-had recourse to the Romans; and having bribed Scau-mans called rus, one of their generals, he defeated Aretas with in by Arithe loss of 7000 of his men, and drove him quite out stobulus. of the country. the Roman forces in the east, and whom they made the arbitrator of their differences. But he, fearing that Aristobulus, against whom he intended to declare, might obstruct his intended expedition against the Nabatheans, difmiffed them with a promife, that as foon as he had subdued Aregus, he would come into Judea and decide their controverfy.

This delay gave fuch offence to Aristobulus, that he fuddenly departed for Judea without even taking leave of the Roman general, who on his part was no lefs offended at this want of refpect. The confequence was, that Pompey entered Judea with those troops with which he had defigned to act against the Nabathæans, and fummoned Aristobulus to appear before him. The Jewish prince would gladly have been excufed; but was forced by his own people to comply with Pompey's fummons, to avoid a war with that general. He came accordingly more than once or twice

fews. to him, and was difmiffed with great promifes and lexander found means to escape into Judea, where he Jews. marks of friendship. But at last Pompey insisted, that he should deliver into his hands all the fortified places he poffeffed : which let Ariflobulus plainly fee that he was in the interest of his brother, and upon this he fled to Jerusalem with a delign to oppose the Romans to the utmost of his power. He was quickly followed by Pompey; and to prevent hostilities was at last for-ced to go and throw himself at the feet of the haughty Roman, and to promife him a confiderable fum of money as the reward of his forbearance. This fubmission was accepted; but Gabinus, being fent with fome troops to receive the flipulated fum, was repulfed by the garrison of Jerusalem, who shut the gates against him, and refused to fulfil the agreement. This disappointment so exasperated Pompey, that he immediately marched with his whole army against the

gaken by

Pompey.

The Roman general first sent proposals of peace ; but finding the Tews resolved to flanc out to the last. he began the fiege in form. As the place was ftrongly fortified both by nature and art, he might have found it very difficult to accomplish his design, had not the Tews been fuddenly feized with a qualm of conscience respecting the observance of the sabbath-day. From the time of the Maccabees they had made no fcruple of taking up arms against an offending enemy on the fabbath; but now they discovered, that though it was lawful on that day to fland on their defence in cafe they were actually attacked, yet it was unlawful to do any thing towards the preventing of those preparatives which the enemy made towards fuch future affaults. As therefore they never moved an hand to hinder the erection of mounds and batteries, or the making of breaches in their walls on the fabbath, the befiegers at last made such a confiderable breach on that day, that the garrifon could no longer refift them. The city was therefore taken in the year 63 B. C. 12,000 of the inhabitants were flaughtered, and many more died by their own hands; while the priefts, who were offering up the usual prayers and facrifices in the temple, chose rather to be butchered along with their brethren, than fuffer divine fervice to be one moment interrupted. At last, after the Romans had fatiated their cruelty with the death of a vast number of the inhabitants, Hyrcanus was reftored to the pontifical dignity with the title of prince; but forbid to affume the title of king, to wear a diadem, or to extend his territories beyond the limits of Judea. To prevent future revolts, the walls were pulled down; and Scaurus was left governor with a fufficient force. But before he departed, the Roman general gave the Jews a still greater offence than almost any thing he had hitherto done; and that was by entering into the most facred recesses of the temple, where he took a view of the golden table, candleftick, cenfers, lamps, and all the other facred veffels; but, out of respect to the Deity, forbore to touch any of them, and when he came out commanded the priefts immediately to purify the temple according to custom.

Pompey having thus fubdued the Jewish nation, set out for Rome, carrying along with him Aristobulus and his two fons Alexander and Antigonus, as captives to adorn his future triumph. Aristobulus himself and his fon Antigonus were led in triumph; but A-

raifed an army of 10,000 foot and 1500 horfe, and began to fortify feveral strong holds, from whence he made incursions into the neighbouring country. As for Hyrcanus, he had no fooner found himfelf freed from his rival brother, than he relapfed into his former indolence, leaving the care of all his affairs to Antipater, who, like a true politician, failed not to turn the weakness of the prince to his own advantage and the aggrandizing of his family. He forefaw, however, that he could not cafily compass his ends, unless he ingratiated himself with the Romans; and therefore spared neither pains nor cost to gain their favour. Scaurus foon after received from him a fupply of corn and other provisions, without which his army, which he had led against the metropolis of Arabia, would have been in danger of perishing; and after this, he prevailed on the king to pay 300 talents to the Romans, to prevent them from ravishing his country. Hyrcanus was now in no condition to face his enemy Alexander; and therefore had again recourse to the Romans, Antipater at the fame time fending as many troops as he could spare to join them. Alexander ventured a battle; but was defeated with confiderable lofs. and besieged in a strong fortress named Alexandrion. Here he would have been forced to furrender; but his mother, partly by her address, and partly by the services the found means to do the Roman general, prevailed upon him to grant her fon a pardon for what was past. The fortresses were then demolished, that they might not give occasion to fresh revolts; Hyrcanus was again restored to the pontifical dignity; and the province was divided into five feveral districts, in each of which a feparate court of judicature was erect- Jewish go-The first of these was at Jerusalem, the second vernment at Gadara, the third at Amath, the fourth at Jeri-changed cho, and the fifth at Sephoris in Galilee. Thus was the into an government changed from a monarchy to an arifto ariftocracy, cracy, and the Jews now fell under a fet of domineering lords.

Soon after this, Aristobulus found means to escape from his confinement at Rome, and raifed new troubles in Judea, but was again defeated and taken prifoner: his fon also renewed his attempts; but was in like manner defeated, with the loss of near 10,000 of his followers; after which Gabinius, having fettled the affairs of Judea to Antipater's mind, refigned the government of his province to Crassus. The only transaction during his government was his plundering the temple of all its money and facred utenfils, amounting in the whole to 10,000 Attic talents, i. e. above two millions of our money. After this facrilege, Craffus fet out on his expedition against Parthia, where he perished; and his death was by the Jews interpreted as a divine judgment for his impiety.

The war between Cæfar and Pompey afforded the Jews fa-Jews some respite, and likewise an opportunity of in youred by gratiating themselves with the former, which the poli-Casar. tic Antipater readily embraced. His fervices were rewarded by the emperor. He confirmed Hyrcanus in his priesthood, added to it the principality of Judea to be entailed on his posterity for ever, and restored the Jewish nation to their ancient rights and privileges; ordering at the fame time a pillar to be erected, whereon all thefe grants, and his own decree, should be en-

graved,

graved, which was accordingly done; and foon after, when Cæfar himfelf came into Judea, he granted liberty also to fortify the city, and rebuild the wall which

had been demolished by Pompey.

During the lifetime of Cafar, the Jews were fo highly favoured, that they could fearcely be faid to feel the Roman yoke. After his death, however, the nation fell into great diforders; which were not finally quelled till Herod, who was created king of Judea by Marc Anthony in 40 B. C. was full estabished on the throne by the taking of Jerusalem by his allies the Romans in 37 B. C. The immediate confequence of this was another cruel pillage and maffacre; then followed the death of Antigonus the fon of Aristobulus, the Jewish who had for three years maintained his ground against Herod, put to death his brother Phasael, and cut of Hyrcanus's ears, in order the more effectually to inca-

Herod

throne.

pacitate him for the high-priesthood. The lews gained but little by this change of ma-Histyranny flers. The new king proved one of the greatest tyrants and cruclty, mentioned in history. He began his reign with a cruel perfecution of those who had fided with his rival Antigonus; great numbers of whom he put to death, feizing and confifcating their effects for his own use. Nay, fuch was his jealoufy in this last respect, that he caused guards to be placed at the city gates, in order to watch the bodies of those of the Antigonian faction who were carried out to be buried, left fome of their riches should be carried along with them. His jealoufy next prompted him to decoy Hyrcanus, the banished pontiff, from Parthia, where he had taken refuge, that he might put him to death, tho' contrary to his most folemn promises. His crucky then fell upon his own family. He had married Mariamne, the daughter of Hyrcanus; whose brother, Aristobulus, a young prince of great hopes, was made high-prieft at the intercession of his mother Alexandra. But the tyrant, confcious that Ariftobulus had a better right to the kingdom than himfelf, caused him soon after to be drowned in a bath. The next victim was his beloved queen Mariamne herself. Herod had been summoned to appear first before Marc Anthony, and then before Augustus, in order to clear himself from some crimes laid to his charge. As he was, however, doubtful of the event, he left orders, that in case he was condemned, Mariamne should be put to death. This, together with the death of her father and brother, gave her fuch an aversion for him, that she showed it on all occasions. By this conduct the tyrant's refentment was at last fo much inflamed, that having got her falfely accused of infidelity, she was condemned to die, and executed accordingly. She fuffered with great refolution; but with her ended all the happiness of her husband. His love for Mariamne increased so much after her death, that for some time he appeared like one quite distracted. His remorfe, however, did not was foon followed by that of her mother Alexandra, and this by the execution of feveral other persons who had joined with her in an attempt to fecure the kingdom to the fons of the deceafed queen.

Herod, having now freed himfelf from the greatest part of his supposed enemies, began to show a greater contempt for the Jewish ceremonies than formerly; and

Nº 164.

him odious to his subjects. Ten bold fellows at fast took it into their heads to enter the theatre where the tyrant was celebrating fome games, with daggers concealed under their clothes, in order to stab him or some of his retinue. In case they should miscarry in the attempt, they had the desperate satisfaction to think, that, if they perished, the tyrant would be rendered fill more odious by the punishment inflicted on them. They were not miltaken: for Herod being informed of their defign by one of his spies, and causing the allassins to be put to a most excruiating death, the people were fo much exasperated against the informer. that they cut and tore him to pieces, and call his flesh to the dogs. Herod tried in vain to discover the authors of this affront; but at last having caused some women to be put to the rack, he extorted from them the names of the principal perfous concerned, whom he caused immediately to be put to death with their families. This produced fuch disturbances, that, apprehending nothing less than a general revolt, he set about fortifying Jerusalem with several additional works, rebuilding Samaria, and putting garrifons into feveral fortreffes in Judea. Notwithstanding this, however, Herod had shortly after an opportunity of regaining the affections of his fubjects in some meafure, by his generofity to them during a famine; but as he foon relapfed into his former cruelty, their love was again turned into hatred, which continued till his death.

Herod now, about 23 B. C. began to adorn his Rebuilde cities with many flately buildings. The most re-the temple, markable and magnificent of them all, however, was the temple at Jerusalem, which he is faid to have raifed to a higher pitch of grandeur than even Solomon himself had done. Ten thousand artificers were immediately fet to work, under the direction of 1000 priefts, the best skilled in carving, masonry, &c. all of whom were kept in constant pay. A thousand carts were employed in fetching materials; and fuch a number of other hands were employed, that every thing was got ready within the space of two years. After this they fet about pulling down the old building, and rearing up the new one with the fame expedition : fo that the holy place, or temple, properly fo called, was finished in a year and an half; during which we are told that it never rained in the day-time, but only in the night. The remainder was finished in fome-what more than eight years. The temple, properly fo called, or holy place, was but 60 cubits high, and as many in breadth; but in the front he added two wings or shoulders which projected 20 cubits more on each fide, and which in all made a front of 120 cubits in length, and as many in height; with a gate 70 cabits high and 20 in breadth, but open and without any doors. The stones were white marble, 25 cubits in length, 12 in height, and 9 in breadth, all wrought get the better of his cruelty. The death of Marianne . and polished with exquisite beauty; the whole resembling a stately palace, whose middle being considerably raifed above the extremities of each face, made it afford a beautiful vista at a great distance, to those who came to the metropolis. Instead of doors, the gates closed with very coftly veils, enriched with a variety of flowering of gold, filver, purple, and every thing that was rich and curious; and on each fide of introduced a number of heathenish games, which made the gates were planted two stately columns, from

whose cornices hung golden festoons and vines, with stones. It was surrounded, at a convenient distance, their clusters of grapes, leaves, &c. curiously wrought. The fuperstructure, however, which was properly reared on the old foundation without fufficient additions, proved too heavy, and funk down about 20 cubits; fo that its height was reduced to 100. This foundation was of an aftonishing strength and height, of which an account is given under the article JERUSALEM. The platform was a regular square of a stadium or surlong on each fide. Each front of the fquare had a spacious gate or entrance, enriched with fuitable ornaments; but that on the west had four gates, one of which led to the palace, another to the city, and the two others to the fuburbs and fields. This inclosure was furrounded on the outfide with a ftrong and high wall of large stones, well cemented; and on the inside had on each front a flately piazza or gallery, supported by columns of fuch a bigness, that three men could but just embrace them, their circumference being about 27 feet. There were in all 162 of them, which supported a cedar cicling of excellent workmanship, and formed three galleries, the middlemoft of which was the largest and higheft, it being As feet in breadth and 100 in height. whereas those on each side were but 30 feet wide and 50 in height.

The piazzas and court were paved with marble of various colours : and, at a small distance from the galleries, was a fecond inclosure, furrounded with a flight of beautiful marble rails, with flately columns at proper distances, on which were engraven certain admonitions in Greek and Latin, to forbid strangers, and those Jews that were not purified, to proceed farther under pain of death. This inclosure had but one gate on the east fide; none on the west; but on the north and fouth it had three, placed at equal diffances from

each other.

A third inclosure furrounded the temple, properly fo called, and the altar of burnt-offerings; and made what they called the court of the Hebrews or Ifraelites. It was fquare like the reft: but the wall on the outfide was furrounded by a flight of 14 fleps, which hid a confiderable part of it; and on the top was a terrace, of about 12 cubits in breadth, which went quite round the whole cincture. The east fide had but one gate; the west none; and the north and south four, at equal diffances. Each gate was afcended by five fteps more before one could reach the level of the inward court; to that the wall which inclosed it appeared within to be but 25 cubits high, though confiderably higher on the outfide. On the infide of each of those gates were raifed a couple of spacious square chambers, in form of a pavilion, 30 cubits wide and 40 in height, each supported by columns of 12 cubits in circumfe-

This inclofure had likewife a double flight of galleries on the infide, supported by a double row of columns; but the western side was only one continued wall, without gates or galleries. The women had likewife their particular courts separate from that of the men, and one of the gates on the north and fouth

leading to it.

The altar of burnt-offerings was likewife high and fmooth, and without steps; and the altar of unhewn brought against him. Vol. IX. Part I.

with a low wall or rail, which divided the court of the priests from that of the lay Israelites; fo that these last were allowed to come thus far to bring their offerings and facrifices; though none but the priefts were allowed to come within that inclosure.

Herod caused a new dedication of this temple to be performed with the utmost magnificence; and prefented to it many rich trophies of his former victories,

after the custom of the Jewish monarchs.

This, and many other magnificent works, however, did not divert the king's attention from his usual jealoufies and cruelty. His lifter Salome, and one of his fons named Antipater, taking advantage of this difpofition, prompted him to murder his two fons by Mariamne, named Alexander and Ariflobulus, who had been educated at the court of Augustus in Italy, and were justly admired by all who faw them. His cruelty foon after broke out in an impotent attempt to deftroy the Saviour of the world, but which was attended with no other confequence than the destruction of 2000 innocent children of his own fubjects. His mifery was almost brought to its summit by the discovery of Antipater's defigns against himself; who was accordingly tried and condemned for treason. Something still more dreadful, however, yet awaited him; he was feized with a most loathsome and incurable disease, in which he was tormented with intolerable pains, fo that his life became a burden. At last he died, to the His deathgreat joy of the Jews, five days after he had put Antipater to death, and after having divided his kingdom among his fons in the following manner .- Archelaus had Judea; Antipas, or Herod, was tetrarch of Galilee and Perea; and Philip had the regions of Trachonitis, Gaulon, Batanea, and Panias, which he erected likewife into a tetrarchy. To his fifter Salome he gave 50,000 pieces of money, together with the cities of Jamnia, Azotus, and Phasaelis; besides some conside-

rable legacies to his other relations. The cruelty of this monfter accompanied him to his grave; nay, he in a manner carried it beyond the grave. Being well apprifed that the Jews would rejoice at being freed from fuch a tyrant, he bethought himself of the sollowing infernal stratagem to damp their mirth. A few days before his death, he fummoned all the heads of the Jews to repair to Jericho under pain of death; and, on their arrival, ordered them all to be flut up in the circus, giving at the fame time strict orders to his fister Salome and her husband to have all the prisoners butchered as soon as his breath was gone out. " By this means (said he), I shall not only damp the people's joy, but sccure a real mourning at my death." These cruel orders, however, were not put in execution. Immediately after the king's death, Salome went to the Hippodrome. where the heads of the Jews were detained, caused the gates to be flung open, and declared to them, that now the king had no farther occasion for their attendance, and that they might depart to their respective homes; after which, and not till then, the news of the king's death was published. Tumults, seditions, and infurrections, quickly followed. Archelaus was op- New divi-

fpacious, being 40 cubits in breadth, and 15 in height. posed by his brethren, and obliged to appear at Rome sion of the The afcent to it was, according to the Mofaic law, before Augustus, to whom many complaints were kingdom After hearing both parties, by Augus-

ethnarch, or governor of a nation; together with a as he showed himself worthy of it. This ethnarchy contained Judea Propria, Idumea, and Samaria: but this last was exempted from one-fourth of the taxes paid by the reft, on account of the peaceable behaviour of the inhabitants during the late tumults. The remainder was divided between Philip and Herod; the former of whom had Trachonitis, Batanea, and Auranitis, together with a fmall part of Galilee; the latter had the rest of Galilee and the countries beyond the Jordan. Salome had half a million of filver, together with the cities of Jamnia, Azotus, Phasaelis, and Afcalon.

For fome years Archelaus enjoyed his government in peace; but at last, both Jews and Samaritans, tired out with his tyrannical beliaviour, joined in a petition to Augustus against him. The emperor immediately fummoned him to Rome, where, having heard his accufation and defence, he banished him to the city of Vienne in Dauphiny, and confifcated all his effects. Judea being by this fentence reduced to -a Roman province, was ordered to be taxed; and Cyrenius the governor of Syria, a man of confular dignity, was fent thither to fee it put in execution : which having done, and fold the palaces of Archelaus, and feized upon all his treasure, he returned to Antioch, leaving the Jews in no fmall ferment on account of this

new tax.

Thus were the feeds of diffension fown between the Iews and Romans, which ended in the most lamentable catastrophe of the former. The Jews, always impatient of a foreign yoke, knew from their prophecies, that the time was now come when the Mcfliah should appear. Of consequence, as they expected him to be a great and powerful warrior, their rebellious and feditious foirit was heightened to the greatest degree : and they imagined they had nothing to do but take up arms, and victory would immediately declare on their fide. From this time, therefore, the country was never quiet; and the infatuated people, while they rejected the true Messiah, gave themselves up to the direction of every impostor who chose to lead them to their own destruction. The governors appointed by the Romans were also frequently changed, but feldom for the better. About the 16th year of Christ, Pontius Pilate was appointed governor; the whole of whose administration, according to Josephus, was one continued fcene of venality, rapine, tyranny, and every wicked action; of racking and putting innocent men to death, untried and uncondemned; and of every kind of favage cruelty. Such a governor was but ill calculated to appeale the ferments occasioned by the late tax. Indeed Pilate was fo far from attempting this, that he greatly inflamed them by taking every occasion of introducing his standards with images and pictures, confecrated shields, &c. into their city; and at last attempting to drain the treasury of the temple, under pretence of bringing an aqueduct into Jerusalem. The most remarkable transaction of his government, however, was his condemnation of TESUS CHRIST: feven years after which he was removed from Judea: and in a short time Agrippa, the grand-

the emperor made the following division of the king- fon of Herod the Great, was promoted by Caius to doin: Archelaus had one half, under the title of the regal dignity. He did not, however, long enjoy this honour; for, on his coming into Judæa, having Agrippa promife that he should have the title of king, as soon raised a persecution against the Christians, and blas-made king, phemously suffering himself to be styled a God by some deputies from Tyre and Sidon, he was miraculoufly ftruck with a difease, which soon put an end to his life. The facred historian tells us, that he was eaten of worms; and Josephus, that he was feized with most violent pains in his heart and bowels; fo that he could not but reflect on the baseness of those flatterers, who had but lately complimented him with a kind of divine immortality, that was now about to expire in all the torments and agonies of a miferable mortal.

> On the death of Agrippa, Judæa was once more The kingreduced to a province of the Roman empire, and had dom again new governors appointed over it. These were Venti-reduced to dius, Felix, Festus Albinus, and Gessius Florus province. Under their government the Jewish affairs went on from bad to worfe; the country fwarmed with robbers and affaffing: the latter committing every where the most unheard-of cruelties under the pretence of religion; and about 64 A.C. were joined by 18,000 workmen, who had been employed in further repairing and beautifying the temple. About this time also, Gessius Florus, the last and worst governor the Jews ever had, was fent into the country. Josephus feems at a loss for words to describe him by, or a monster to compare him to. His rapines, cruelties. conniving for large fums with the banditti, and, in a word, his whole behaviour, were fo open and barefaced, that he was looked upon by the Jews more like a bloody executioner fent to butcher, than a magistrate to govern them. In this distracted state of the country, many of the inhabitants forfook it to feek for an afylum fomewhere elfe; while those who remained applied themselves to Cettius Gallus, governor of Syria, who was at Jerufalem at the paffover, befeeching him to pity their unhappy state, and free them from the tyranny of a man who had totally ruined their country. Florus, who was prefent when these complaints were brought against him, made a mere jest of them; and Cestius, instead of making a first inquiry into his conduct, difmiffed the Jews with a general promife that the governor should behave better for the future; and fet himfelf about computing the number of Jews at that time in Jerusalem, by the number of lambs offered at that festival, that he might fend an account of the whole to Nero. By his computation, there were at that time in Jerusalem 2,556,000; tho' Josephus thinks they rather amounted to 3,000,000.

In the year 67 began the fatal war with the Romans, Caufe of which was ended only by the destruction of Jerusalem. the last The immediate cause was the decision of a contest war with with the Syrians concerning the city of Cæfarea. The the Ro-Jews maintained that this city belonged to them, be-mans, cause it had been built by Herod; and the Syrians pretended that it had always been reckoned a Greek city, fince even that monarch had reared temples and statues in it. The contest at last came to such an height, that both parties took up arms against each other. Felix put an end to it for a time, by fending fome of the chiefs of each nation to Rome, to plead

and a Ro nor appointed over Judæa.

Archelaus

banished.

terribly

their cause before the emperor, where it hung in sufpenfe till this time, when Nero decided it against the Tews. No fooner was this decision made public, than the Jews in all parts of the country flew to arms; and though they were every where the fufferers, yet, from this fatal period, their rage never abated. Nothing was now to be heard of but robberies, murders, and every kind of cruelty. Cities and villages were filled with dead bodies of all ages, even fucking babes. The Tews The Jews, on their part, spared neither Syrians nor Romans, where they got the better of them; and this maffacred. proved the destruction of great numbers of their peaceful brethren: 20,000 were massacred at Cæsarea, 50,000 at Alexandria, 2000 at Ptolemais, and 3500

at Jerusalem. A great number of affaffins, in the mean time, having joined the factious Jews in Jerusalem, they beat the Romans out of Antonia, a fortress adjoining to the temple, and another called Massada: and likewise out of the towers called Phasael and Marianne, killing all who opposed them. The Romans were at last reduced to such straits, that they capitulated on the fingle condition that their lives should'be spared; notwithstanding which, they were all massacred by the furious zealots: and this treachery was foon revenged on the faithful Jews of Scythopolis. These had offered to affift in reducing their factious brethren; but their fincerity being fuspected by the townsmen, they obliged them to retire into a neighbouring wood, where, on the third night, they were maffacred to the number of 13,000, and all their wealth carried off. The rebels, in the mean time, croffed the Jordan, and took the fortreffes of Machæron and Cyprus; which last they razed to the ground, They de- after having put all the Romans to the fword - This feat Cessius brought Cessius Gallus, the Syrian governor, into Judgea with all his forces; but the Jews, partly by treachery and partly by force, got the better of him, and drove him out of the country with the lofs of

All this time fuch dreadful diffensions reigned among the Jews, that great numbers of the better fort foreseeing the sad effects of the resentment of the Romans, left the city as men do a finking veffel; and the Christians, mindful of their Saviour's prediction, retired to Pella, a city on the other fide of Jordan, whether the war did not reach. Miferable was the fate of fuch as either could not, or would not, leave that devoted city. Vefpafian was now ordered to fent against leave Greece, where he was at that time, and to march with all speed into Judea. He did so accordingly at the head of a powerful army, ordering his fon Titus in the mean time to bring two more legions from A lexandria; but before he could reach that country, the Jews had twice attempted to take the city of Afcalon, and were each time repulfed with the loss of 10,000 of their number. In the beginning of the year 68, Vefpasian entered Galilee at the head of an army of 60,000 men, all completely armed and excellently disciplined. He first took and burnt Gadara: then he laid fiege to Jotapa, and took it after a frout refiftance; at which he was fo provoked, that he caused every one of the Jews to be maffacred or carried into captivity, not

only 1200 were made prisoners, among whom was Josephus the Jewish historian. Japha next shared the same fate, after an obstinate fiege; all the men being maffacred, and the women and children carried into captivity. A week after this the Samaritans, who had affembled on Mount Gerizzim, were almost all put to the fword, or perished. Joppa fell the next victim to the Roman vengeance. It had been formerly laid waste by Cestius; but was now repeopled and fortified by the feditious Jews who infefted the country. It was taken by ftorm, and shared the same fate with the rest. Four thousand Jews attempted to escape by taking to their ships; but were driven back by a fudden tempest, and all of them were drowned or put to the fword. Tarichea and Tiberias were next taken. but part of their inhabitants were spared on account of their peaceable dispositions. Then followed the fieges of Gamala, Gifchala, and Itabyr. The first was taken by ftorm, with a dreadful flaughter of the Jews; the last by stratagem. The inhabitants of Gischala were inclinable to furrender: but a feditious Jew of that town, named John, the fon of Levi, head of the faction, and a vile fellow, opposed it; and, having the mob at his back, overawed the whole city. On the fabbath he begged of Titus to forbear hostilities till to-morrow, and then he would accept his offer ; but instead of that, he fled to Jerusalem with as many as would follow him. The Romans, as foon as they were informed of his flight, purfued, and killed 6000 of his followers on the road, and brought back near 3000 women and children prifoners. The inhabitants then furrendered to Titus, and only the factious were punished; and this completed the reduction of Galilee. The Jewish nation by this time was divided into Different

two very opposite parties: the one foreseeing that sactions this war, if continued, must end in the total ruin of among the their country, were for putting an end to it by fub. Jews. mitting to the Romans; the other, which was the remains of the faction of Judas Gaulonites, breathed nothing but war and confusion, and opposed all peaceable measures with invincible obstinacy. This last, which was by far the most numerous and powerful, confitted of men of the vileft and most profligate characters that can be paralleled in history. They were proud, ambitious, cruel, rapacious, and committed the most horrid and unnatural crimes under the mask of religion. They affirmed every where, that it was offering the greatest dishonour to God to submit to any earthly potentate; much lefs to Romans and to heathens. This, they faid, was the only motive that induced them to take up arms, and to bind themselves under the strictest obligations not to lay them down till they had either totally extirpated all foreign authority, or perished in the attempt. - This dreadful diffention was not confined to Jerufalem, but had infected all the cities, towns, and villages, of Palestine. Even houses and families were so divided against each other, that, as our Saviour had expressly foretold, a man's greatest enemies were often those of his own family and household. In short, if we may believe Josephus, the zealots acted more like incarnate devils than like men who had any fense of humanity left them .- This obliged the contrary party likewife to one being left to carry the dreadful news to their rife up in arms in their own defence against those mit-brethren. Forty thousand perished on this occasion: creants; from whom, however, they suffered much

gooo men.

Vefpaffan them.

Jews. more than they did even from the exasperated Romans.—The zealots began their outrages by murder-Crucity of ing all that opposed them in the countries round about. the zealots. Then they entered Jerusalem; but met with a stout opposition from the other party headed by Ananus, who had lately been high-prieft. A fierce engagement enfued between them; and the zealots were driven into the inner cincture of the temple, where they were closely befieged. John of Gischala above mentioned, who had pretended to fide with the peaceable party, was then fent with terms of accommodation; but, inftead of advising the belieged to accept of them, he perfuaded them still to hold out, and call the Idumeans to their affiltance. They did fo, and procured 20,000 of them to come to their relief; but these new allies were refused admittance into the city. On that night, however, there happened fuch a violent ftorm, accompanied with thunder, lightning, and an earthquake, that the zealots from within the inner court fawed the bolts and hinges of the temple-gates without being heard, forced the guards of the befiegers, fallied into the city, and led in the Idumeans. city was inftantly filled with butcheries of the most horrid kind. Barely to put any of the opposite party to death was thought too mild a punishment; they must have the pleasure of murdering them by inches: fo that they made it now their diversion to put them to the most exquisite tortures that could be invented ; nor could they be prevailed upon to dispatch them till the violence of their torments had rendered them quite incapable of feeling them. In this manner perished 12,000 persons of noble extraction, and in the flower of their age; till at last the Idumeans complained fo much against the putting such numbers to death, that the zealots thought proper to erect a kind of tribunal, which, however, was intended not for judgment but condemnation; for the judges having once acquitted a person who was manifestly innocent. the zealots not only murdered him in the temple, but deposed the new-created judges as persons unfit for their office.

The zealots, after having exterminated all those of any character or distinction, began next to wreak their vengeance on the common people. This obliged many of the Jews to forfake Jerufalem, and take refuge with the Romans, though the attempt was very hazardous; for the zealots had all the avenues well guarded, and failed not to put to death fuch as fell into their hands. Vefpasian in the mean time staid at Cæsarea an idle spectator of their outrages; well knowing that the zealots were fighting for him, and that the strength of the Jewish nation was gradually wasting away. Every thing succeeded to his They turn wish. The zealots, after having massacred or driven their arms away the opposite party, turned their arms against against each other. A party was formed against John, under one Simon who had his head-quarters at the fortrefs of Maffada. This new miscreant plundered, burned, and maffacred, wherever he came, carrying the spoil into the fortress above mentioned. To increase his party, he caufed a proclamation to be published, by which he promifed liberty to the flaves, and proportionable encouragement to the freemen who joined him. This stratagem had the defired effect, and he foon faw himfelf at the head of a confiderable army.

Not thinking himfelf, however, as yet mafter of force Jews. fufficient to befiege Jerusalem, he invaded Idumea with 20,000 men. The Idumeans opposed him with 25,000; and a sharp engagement ensaed, in which neither party was victorious. But Simon, foon after. having corrupted the Idumean general, got their army delivered up to him. By this means he easily became mafter of the country; where he committed fuch cruelties, that the miferable inhabitants abandoned it to feek for shelter in Jerusalem.

In the city, matters went in the fame way. John tyrannized in fuch a manner, that the Idumeans revolted, killed a great number of his men, plundered his palace, and forced him to retire into the temple. In the mean time the people, having taken a notion that he would fally out in the night and fet fire to the city, called a council, in which it was refolved to admit Simon with his troops, in order to oppose John and his zealots. Simon's first attempt against his rival. however, was ineffectual, and he was obliged to content himself with belieging the zealots in the temple. In the mean time the miferies of the city were increafed by the starting up of a third party headed by one Eleazar, who feized on the court of the priefts, and kept John confined within that of the Ifraelites. Eleazar kept the avenues fo well guarded, that none were admitted to come into that part of the temple but those who came thither to offer facrifices; and it was by these offerings chiefly that he maintained himfelf and his men. John by this means found himfelf hemmed in between two powerful enemies, Simon below, and Eleazar above. He defended himself, however, against them both with great resolution; and when the city was invested by the Romans, having pretended to come to an agreement with his rivals. he found means totally to cut off or force Eleazar's men to fubmit to him, fo that the factions were again reduced to two.

The Romans, in the year 72, began to advance to-The Rowards the capital. In their way they destroyed many mans adthousands, wasting the country as they went along; vance to and in the year 73 arrived before the walls of Jerusa. Jerusalems lem, under Titus afterwards emperor. As he was a man of an exceedingly merciful difpolition, and greatly defired to spare the city, he immediately fent offers of peace; but thefe were rejected with contempt, and he himself put in great danger of his life, so that he refolved to begin the fiege in form. In the mean time, Simon and John renewed their hostilities with greater fury than ever. John now held the whole temple, fome of the out-parts of it, and the valley of Cedron. Simon had the whole city to range in; in fome parts of which John had made fuch devastations, that they ferved them for a field of battle, from which they fallied unanimously against the common enemy whenever occasion ferved; after which they returned to their usual hostilities, turning their arms against each other, as if they had Iworn to make their ruin more easy to the Romans. These drew still nearer to the walls, having with great labour and pains levelled all the ground between Scopas and them, by pulling down all the houses and hedges, cutting down the trees. and even cleaving the rocks that stood in their way, from Scopas to the tomb of Herod, and Bethara or the pool of ferpents; in which work fo many

wither.

hands were employed, that they finished it in four factious, who, by their intestine feuds, had destroyed Tews.

38 Offers of peace rejected.

The fiege

with vi-

gour.

Whilst this was doing, Titus fent the besieged some offers of peace; and Josephus was pitched upon to be the messenger of them: but they were rejected with indignation. He fent a fecond time Nicanor and Jofephus with fresh offers, and the former received a wound in his shoulder; upon which Titus resolved to begin the affault in good earnest, and ordered his men to rafe the fuburbs, cut down all the trees, and ufe the materials to raife platforms against the wall. Every thing was now carried on with invincible ardour; the carried on Romans began to play their engines against the city with all their might. The Jews had likewise their machines upon the walls, which they plied with uncommon fury : they had taken them lately from Cethius : but were fo ignorant in their use, that they did little execution with them, till they were better in-

ftructed by fome Roman deferters: till then, their chief fuccess was rather owing to their frequent fallies; but the Roman legions, who had all their towers and machines before them, made terrible havock. The leaft stones they threw were near 100 weight; and these they could throw the length of a quarter of a mile against the city, and with fuch a force, that they could do mischief on those that stood at some distance behind them. Titus had reared three towers 50 cubits high; one of which happening to fall in the middle of the night, greatly alarmed the Roman camp, who immediately ran to arms at the noise of it; but Titus, upon knowing the cause, dismissed them, and caused it to be set up again. These towers, being plated with iron, the Jews tried in vain to fet fire to them, but were at length forced to retire out of the reach of their shot : by which the battering rams were now at full liberty to play against the wall. A breach was foon made in it, at which the Romans entered; and the Jews, abandoning this last inclosure, retired behind the next. This happened about the 28th of April, a fortnight after the beginning of the fiege.

John defended the temple and the castle of Antonia, and Simon the rest of the city. Titus marched close to the second wall, and plied his battering-rams fo furioufly, that one of the towers, which looked towards the north, gave a prodigious shake. The men who were in it, made a fignal to the Romans, as if they would furrender; and, at the same time, fent Simon word to be ready to give them a warm reception. Titus, having discovered their stratagem, plied his work more furioufly, whilft the Jews that were in the tower fet it on fire, and flung themselves into the flames. The tower being fallen, gave them an entrance into the fecond inclosure, five days after gaining the first; and Titus, who was bent on faving the city, would not fuffer any part of the wall or fireets to be demolished; which left the breach and lanes so narrow, that when his men were furioufly repulfed by Simon, they had not room enough to make a quick retreat, so that there was a number of them killed in it. This overfight was quickly rectified; and the attack renewed with fuch vigour, that the place was car-

ried four days after their first repulse.

The famine, raging in a terrible manner in the city, pestilence was soon followed by a pestilence; and as these two an the city. dreadful judgments increased, so did the rage of the he was forced to spare them, and contented himself

fuch quantities of provision, that they were forced to prey upon the people with the most unheard-of cruelty. They forced their houses; and, if they found any victuals in them, they butchered them for not apprifing them of it; and, if they found nothing but bare walls, which was almost every where the case, they put them to the most severe tortures, under pretence that they had some provision concealed. " I should (fays Josephus) undertake an impossible task, were I to enter into a detail of all the cruelties of those impious wretches; it will be fufficient to fav, that I do not think, that fince the creation any city ever fuffered fuch dreadful calamities, or abounded with men fo

fertile in all kinds of wickedness,"

Titus, who knew their miserable condition, and was still willing to spare them, gave them four days to cool; during which he caused his army to be muttered, and provisions to be distributed to them in fight of the Jews, who flocked upon the walls to fee it. Jo- offers of fephus was fent to fpeak to them afresh, and to exhort peace rethem not to run themselves into an inevitable ruin by jected. obstinately persisting in the desence of a place which could hold out but a very little while, and which the Romans looked upon already as their own. But this flubborn people, after many bitter invectives, began to dart their arrows at him; at which, not at all difcouraged, he went on with greater vehemence : but all the effect it wrought on them was, that it prevailed on great numbers to fleal away privately to the Romans, whilft the rest became only the more desperate and resolute to hold out to the last, in spite of Ti-

tus's merciful offers.

To haften therefore their deftined ruin, he caufed the city to be furrounded with a strong wall, to prevent either their receiving any fuccours or provision from abroad, or their escaping his resentment by flight. This wall, which was near 40 stadia or five miles in circuit, was yet carried on with fuch speed, and by fo many hands, that it was finished in three days; by which one may guess at the ardour of the beliegers to

make themselves masters of the city.

There was now nothing to be seen thro' the streets of Jerusalem but heaps of dead bodies rotting above ground, walking skeletons, and dying wretches. As many as were caught by the Romans in their fallies. Titus caused to be crucified in fight of the town, to inject a terror among the reft : but the zealots gave it out, that they were those who fled to him for protection; which when Titus understood, he fent a prisoner with his hands cut off to undeceive, and affure them. that he spared all that voluntarily came over to him; which encouraged great numbers to accept his offers, tho' the avenues were closely guarded by the factious. who put all to death who were caught going on that errand. A greater mischief than that was, that even those who escaped fase to the Roman camp were miferably butchered by the foldiers, from a notion which these had taken that they had swallowed great quantities of gold; infomuch that two thousand of them were ripped up in one night, to come at their suppofed treasure. When Titus was apprifed of this barbarity, he would have condemned all those butchering wretches to death; but they proved fo numerous, that

with fending a proclamation thro' his camp, that as many as should be suspected thenceforward of that horrid villany, should be put to immediate death : yet did not this deter many of them from it, only they did it more privately than before; fo greedy were they of that bewitching metal. All this while the defection increased still more thro' the inhumanity of the faction within, who made the miferies and dying groans of their flarving brethren the subject of their cruel mirth, and carried their barbarity even to the fleathing of their fwords in fport in those poor wretches, under pretence of trying their sharpness.

When they found therefore that neither their guards nor feverities could prevent the people's flight, they had recourse to another stratagem equally impious and cruel: which was, to hire a pack of vile pretenders to prophecy, to go about and encourage the despairing remains of the people to expect a speedy and miraculous deliverance; and this imposture proved a greater expedient with that infatuated nation than their other

precautions.

Miferable condition

Nothing could be more dreadful than the famished condition to which they were now reduced. The poor, of the Jews having nothing to trust to but the Roman's mercy or a speedy death, ran all hazards to get out of the city; and if in their flight, and wandering out for herbs or any other fustenance, they fell into the hands of any of Titus's parties fent about to guard the avenues, they were unmercifully fcourged, and crucified if they made the least refistance. The rich within the walls were now forced, though in the most private manner, to give half, or all they were worth, for a measure of wheat, and the middling fort for one of barley. This they were forced to convey into fome private place in their houses, and to feed upon it as it was, without daring to pound or grind it, much less to boil or bake it, left the noise or smell should draw the rapacious zealots to come and tear it from them. Not that these were reduced to any real want of provisions, but they had a double end in this barbarous plunder; to wit, the starving what they cruelly styled all useless persons, and the keeping their own stores in reserve. It was upon A mother this fad and pinching juncture, that an unhappy moown child, ther was reduced to the extremity of butchering and

eating her own child.

When this news was spread through the city, the horror and confternation were as universal as they were inexpressible. It was then that they began to think themselves forfaken by the Divine Providence, and to expect the most terrible effects of his anger against the poor remains of their nation; infomuch that they began to envy those that had perished before them, and to wish their turn might come before the fad expected catastrophe. Their fears were but too just; fince Titus, at the very first hearing of this inhuman deed, fwore the total extirpation of city and people. " Since (faid he) they have so often refuted my proffers of pardon, and have preferred war to peace, rebellion to obedience, and famine, fuch a dreadful one especially, to plenty, I am determined to bury that accuried metropolis under its ruins, that the fun may never shoot his beams on a city where the mothers feed on the flesh of their children, and the fathers, no less guilty than they, choose to drive them to such extremities, rather than lay down their arms."

The dreadful action happened about the end of July, Jews. by which time the Romans, having purfued their attacks with fresh vigour, made themselves masters of the fortress Antonia; which obliged the Jews to set fire to those stately galleries which joined it to the temple, left they should afford an easy passage to the befiegers into this last. About the same time Titus, with much difficulty, got materials for railing new mounds and terraces, in order to haften the fiege, and fave, if possible, the fad remains of that once glorious flructure; but his pity proved ftill worfe and worfe bestowed on those obttinate wretches, who only became the more furious and desperate by it. Titus at length caused fire to be set to the gates, after having had a very bloody encounter, in which his men were repulfed with lofs. The Jews were fo terrified at it, that they fuffered themselves to be devoured by the flames, without attempting either to extinguish them or fave themselves. All this while Josephus did not cease exhorting the infatuated people to surrender, to represent to them the dreadful consequences of an obstinate resistance, and to assure them that it was out of mere compassion to them that he thus hazarded his own life to fave theirs: he received one day fuch a wound in his head by a stone from the battlements, as laid him for dead on the ground. The Jews fallied out immediately, to have feized on his body ; but the Romans proved too quick and flrong for them, and carried him off.

By this time the two factions within, but especially John plumthat of John, having plundered rich and poor of all ders the they had, fell also on the treasury of the temple. temple. whence John took a great quantity of golden utenfils, together with those magnificent gifts which had been prefented to that facred place by the Tewish kings. by Augustus, Livia, and many other foreign princes, and melted them all to his own use. The repositories of the facred oil which was to maintain the lamps, and of the wine which was referved to accompany the usual facrifices, were likewife feized upon, and turned into common use; and the latt of this to such excess, as to make himfelf and his party drunk with it. All this while, not only the zealots, but many of the people, were still under fuch an infatuation, that tho the fortress Antonia was loft, and nothing left but the temple, which the Romans were preparing to batter down, yet they could not perfuade themfelves, that God would fuffer that holy place to be taken by heathens, and were still expecting some sudden and miraculous deliverance. Even that vile monster John. who commanded there, either feemed confident of it, or elfe endeavoured to make them think him fo. For, when Josephus was fent for the last time to upbraid his obitinately exposing that facred building, and the miserable remains of God's people, to sudden and fure destruction, he only answered him with the bitterest invectives; adding, that he was defending the Lord's vineyard, which he was fure could not be taken by any human force. Josephus in vain reminded him of the many ways by which he had polluted both city and temple; and in particular of the feas of blood which he caused to be shed in both those facred places, and which, he affured him from the old prophecies, were a certain fign and forerunner of their speedy sur-

render and destruction. John remained as inflexible

Titus Iwears the otal ruin f the city.

eats her

as if all the propints had affured him of a deliverance; till at length Titus, forefeeing the inevitable ruin of that flately edifice, which he was ftill extremely defirous to fave, vouchfafed even himfelf to speak to them, and to perfuade them to furrender. But the factious, looking upon this condenfeention as the effects of his fear rather than generofity, only grew the more furious upon it, and forced him at last to come to those extremities, which he had hitherto endeavoured to avoid. That his army, which was to attack the temple, might have the freer paffage towards it thro' the castle. Antonia, he caused a considerable part of

the wall to be pulled down, and levelled; which proved fo very firong, that it took him up feven whole

days, by which time they were far advanced in the month of July. 46 The daily

terrupted.

It was on the 17th day of that month, as all Josephus's copies have it, that the daily facrifice ceafed for the first time fince its reftoration by the brave Judas Maccabeus, there being no proper person left in the temple to offer it up. Titus caused the factions to be feverely upbraided for it; exhorted John to fet up whom he would to perform that office, rather than fuffer the service of God to be set aside; and then challenged him and his party to come out of the temple, and fight on a more proper ground, and thereby fave that facred edifice from the fury of the Roman troops. When nothing could prevail on them, they began to fet fire again to the gallery which yielded a communication between the temple and the caftle Antonia. The Tews had already burnt about 20 cubits of it in length; but this fecond blaze, which was likewife encouraged by the befieged, confumed about 14 more; after which, they beat down what remained flanding. On the 27th of July, the Jews, having filled part of the western portico with combustible matter, made a kind of flight; upon which, some of the forwardest of the Romans having fealed up to the top, the Jews fet fire to it, which flamed with fuch fudden fury, that many of the former were confumed in it, and the reft, venturing to jump down from the battlements, were, all but one, crushed to death.

On the very next day, Titus having fet fire to the north gallery, which inclosed the outer court of the temple, from fort Antonia to the valley of Cedron, got an eafy admittance into it, and forced the belieged into that of the priefts. He tried in vain fix days to batter down one of the galleries of that precinct with an helepolis: he was forced to mount his battering-rams on the terrace, which was raifed by this time; and yet the firength of this wall was fuch, that it eluded the force of these also, tho' others of his troops were busy in fapping it. When they found that neither ranss nor fapping could gain ground, they bethought themfelves of fealing; but were vigorously repulled in the attempt, with the lois of fome Handards, and a number of men. When Titus therefore found that his defire of faving that building was like to coft fo many lives, he fet fire to the gates, which, being plated with filver, burnt all that night, whilft the metal dropt down in the melting. The flame foon communicated itself to the porticoes and galleries; which the befieged beheld without offering to flop it, but contented themfelves with fending whole volleys of impotent curfes against the Romans. This was done on the eighth of

August; and, on the next day, Titus, having given Jews. orders to extinguish the fire, called a council, to determine whether the remainder of the temple should be faved or demolished. That general was still for the former, and most of the rest declared for the latter; alleging, that it was no longer a temple, but a fcene of war and flaughter, and that the Jews would never be at reft as long as any part of it was left flanding: but when they found Titus stiffly bent on preserving so noble an edifice, against which he told them he could have no quarrel, they all came over to his mind. The next day, August the roth, was therefore determined for a general affault : and the night before the Jews made two desperate fallies on the Romans; in the last of which, these, being timely fuccoured by Titus, beat them back into their in-

But whether this last Jewish effort exasperated the befiegers, or, which is more likely, as Josephus thinks, pushed by the hand of Providence, one of the Roman foldiers, of his own accord, took up a blazing firebrand, and, getting on his comrade's fhoulders, threw it into one of the apartments that furrounded the fanctuary, through a window. This immediately fet the whole north-fide in a flame up to the third ftory, on the same satal day and month in which it had been formerly burnt by Nebuchadnezzar. Titus, who was gone to reft himfelf a while in his pavilion, was awaked at the noife, and ran immediately to give orders to have the fire extinguished. He called, prayed, threatened, and even caned his men, but in vain; the confusion was fo great, and the foldiers so obstinately bent upon destroying all that was left, that he was neither heard nor minded. Those that flocked thither from the camp, inflead of obeying his orders, were bufy, either in killing the Jews, or in increasing the flames. When Titus observed that all his endeavours were vain, he entered into the fanctuary and the most holy place, in which he found still fuch fumptuons utenfils and other riches as even exceeded all that had been told him of it. Out of the former he faved the golden candleftick, the table of shew bread, the altar of perfumes, all of pure gold, and the book or volume of the law, wrapped up in a rich gold tiffue: but in the latter he found no utenfils, because, in all probability, they had not made a fresh ark fince that of Solomon had been loft. Upon his coming out of that facred place, some other soldiers set fire to it, and obliged those that had flaid behind to come out : they all fell foul on the plunder of it, tearing even the gold plating off the gates and timber work, and carried off all the coftly utenfils, robes, &c. they found, infomuch that there was not one of them who did not en-

An horrid maffacre followed foon after, in which a A dreadful great many thousands perished; some by the slames, massacre. others by the fall from the battlements, and a greater number by the enemy's fword, which destroyed all it met with, without diffinction of age, fex, or quality. Among them were upwards of 6000 perfons who had been feduced thither by a falfe prophet, who promifed them that they should find a. speedy and miraculous relief there on that very day. Some of them remained five whole days on the top of the walls, and afterwards threw themselves on the gene-

The gates of the temple fet on fire.

the time, and were led to execution. The Romans carried their fury to the burning of all the treasure-houfes of the place, tho' they were full of the richeft furniture, plate, veftments, and other things of value, which had been laid up in those places for security. In a word, they did not cease burning and butchering, till they had defroyed all, except two of the templegates, and that part of the court which was deflined

for the women. In the mean time the feditious made fuch a vigorous push, that they escaped the fury of the Romans, at least for the present, and retired into the city. But here they found all the avenues fo well guarded, that there was no possibility left for them to get out; which obliged them to fecure themselves as well as they could on the fouth-fide of it, from whence Simon, and John of Gifchala, fent to defire a parley with Titus. They were answered, that though they had been the till the end of October. The two chiefs, with 700 cause of all this bloodshed and ruin, yet they should have their lives spared, if they laid down their arms, and furrendered themselves prisoners. To this they most folemn oaths, never to furrender; and therefore, only begged leave to retire into the mountains with their wives and children: which infolence fo exasperated the Roman general, that he caused an herald to bid them fland to their defence; for that not one of them should be spared, fince they had rejected his last offers of pardon. Immediately after this, he abandoned the city to the fury of the foldiers, who fell forthwith on plundering, fetting fire every where, and murdering all that fell into their hands; whilft the factious, who were left, went and fortified themselves in the royal palace, where they killed 8000 Jews who

had taken refuge there. In the mean time, great preparations were making for a vigorous attack on the upper city, especially on the royal palace; and this took them up from the 20th of August to the 7th of September, during which time great numbers came and made their fubmission to Titus. The warlike engines then played so furiously on the factious, that they were taken with a fudden panic; and, instead of sleeing into the towers of Hippicos, Phasael, or Mariamne, which were yet untaken, and fo strong that nothing but famine could have reduced them, they ran like madmen towards Siloah, with a defign to have attacked the wall of circumvallation, and to have escaped out of the city; but, being there repulsed, they were forced to go and hide themselves in the public finks and common fewers, fome one way and fome another. All whom the Romans could find were put to the fword, and the ci-ty was fet on fire. This was on the eighth of September, when the city was taken and entered by Titus. He would have put an end to the maffacre; but his men killed all, except the most vigorous, whom they shut up in the porch of the women just mentioned. Fronto, who had the care of them, referved the youngest and most beautiful for Titus's triumph; and fent all that were above feventeen years of age into Egypt, to be employed in some public works there; and a great number of others were fent into feveral cities of Syria, and other provinces, to be exposed on in general have been better treated by the Mahomethe public theatre, to exhibit fights, or be devour- tans and Pagans than by Christians. Since the revi-

ral's mercy; but were answered that they had outstaid ed by wild beasts. The number of those prisoners Jews. amounted to 97,000; besides about 11,000 more, who were either starved through neglect, or starved themfelves through fullenness and despair .- The whole number of Jews who perished in this war is computed at upwards of 1,400,000.

Besides these, however, a vast number perished in caves, woods, wilderneffes, common-fewers, &c. of whom no computation could be made. Whilst the foldiers were still bufy in burning the remains of the city, and vifiting all the hiding-places, where they killed numbers of poor creatures who had endeavoured Simon and to evade their cruelty, the two grand rebels Simon John takens and John were found, and referved for the triumph of the conqueror. John, being pinehed with hunger, foon came out; and having begged his life, obtained it; but was condemned to perpetual imprisonment. Simon, whose retreat had been better stored, held out of the handsomest Jewish captives, were made to attend the triumphal chariot; after which Simon was dragged through the ftreets with a rope about his replied, that they had engaged themselves, by the neck, severely scourged, and then put to death; and John was fent into perpetual imprisonment.-Three caftles fill remained untaken, namely, Herodion, Machæron, and Massada. The two former capitulated; but Massada held out. The place was exceedingly Desperate ftrong both by nature and art, well ftored with all end of the kinds of provisions, and defended by a numerous gar-garrison of rison of zealots, at the head of whom was one Elea-Massada. zar, the grandfon of Judas Gaulonites, formerly mentioned. The Roman general baving in vain tried his engines and battering-rams against it, bethought himfelf of furrounding it with a high and ftrong wall, and then ordered the gates to be fet on fire. The wind pushed the slames so fiercely against the Jews, that Eleazar in despair persuaded them first to kill their wives and children, and then to choose ten men by lot, who should kill all the rest; and lastly one out of the furviving ten to dispatch them and himself; only this last man was ordered to set fire to the place before he put an end to his own life. All this was accordingly done; and on the morrow, when the Romans were preparing to fcale the walls, they were greatly furprifed neither to fee nor hear any thing move. On this they made fuch an hideous outcry, that two women, who had concealed themselves in an aqueduct, came forth and aequainted them with the desperate catastrophe of the besieged.

Thus ended the Jewish nation and worship; nor State of the have they ever fince been able to regain the smallest Jews fince footing in the country of Judea, nor indeed in any the destrucother country on earth, though there is fearce any part tion of of the globe where they are not to be found. They continue their vain expectations of a Messiah to deliver them from the low estate into which they are fallen; and, notwithstanding their repeated disappointments, there are few who can ever be perfuaded to embrace Christianity. Their ceremonies and religious worship ought to be taken from the law of Moses; but they have added a multitude of absurdities not worth the inquiring after. In many countries, and in different ages, they have been terribly massacred, and

val of arts and learning, however, they have felt the every 15 days. When they get wine, they drink it to Jezrael benefit of that increase of humanity which hath taken excess; and it is said, that they sometimes do this with place almost all over the globe. It is faid, that in this a religious purpose, calling it the blood of Christ. They country the life of a lew was formerly at the disposal of the chief lord where he lived, and likewife all his goods. So ftrong also were popular prejudices and sufpicions against them, that in the year 1348, a fatal endemic distemper raging in a great part of Europe, it was faid that they had poisoned the springs and wells; in confequence of which a million and a half of them were cruelly maffacred. In 1492, half a million of them were driven out of Spain, and 150,000 from Portugal. Edward I. did the fame. In short, they were every where perfecuted, oppressed, and most rigoroufly treated.

In this enlighted period a more generous system is taking place. France has allowed them the rights of citizens, which induces numbers of the most wealthy Iews to fix their refidence in that country. Poland is the Mediterranean. about granting them very great privileges and immunities; England, Holland, and Pruffia tolerate and protect them; and the emperor has revoked fome reitrictions, for which an edict has lately passed: Spain, Portugal, and fome of the Italian states, are still, however, totally averse to their dwelling among them.

JEZIDES, among the Mahometans; a term of fimilar import with heretics among Christians.

The Jezides are a numerous fect inhabiting Turky and Perfia, so called from their head Jezid, an Arabian prince, who flew the fons of Ali, Mahomet's father in-law; for which reason he is reckoned a parricide, and his followers hereites. There are about 20,000 Jezides in Turky and Persia; who are of two forts, black and white. The white are clad like Turks; and diftinguished only by their shirts, which are not flit at the neck like those of others, but have only a round hole to thrust their heads through. This is in memory of a golden ring, or circle of light, which descended from heaven upon the neck of their cheq, the head of their religion, after his undergoing a fait of forty days. The black Jezides, though married, are the monks or religious of the order; and these are called Fakirs.

The Turks exact excessive taxes from the Jezides, who hate the Turks as their mortal enemies; and when, in their wrath, they curse any creature, they call it muffulman: but they are great lovers of the Christians, being more fond of Jesus Christ than of Mahomet, and are never circumcifed but when they are forced to it. They are extremely ignorant, and believe both the bible and the koran without reading either of them : they make yows and pilgrimages, but have no places of

religious worship.

All the adoration they pay to God confifts of fome fongs in honour of Jefus Christ, the virgin, Mofes, and fometimes Mahomet; and it is a principal point of their religion never to fpeak ill of the devil, left he should refent the injury, if ever he should come to be in favour with God again, which they think possible; whenever they fpeak of him, they call him the angel Peacock. They bury their dead in the first place they come at, rejoicing as at a festival, and celebrating the entry of the deceased into heaven. They go in companies like the Arabians, and change their habitations versal febrifuge, or to use it indiferiminately.

Vol. IX. Part I.

buy their wives; and the market-price is 200 crowns for all women, handsome or not, without diffinction.

IEZRAEL, or JEZREEL, a town in the north of Samaria, towards mount Carmel, where flood a palace of the kings of Ifrael, 1 Kings xxi. 18. On the borders of Galilee (Joshua xix.) faid to be one of the towns of Iffachar .- The valley of Jezreel (Judges vi. 17.) was fituated to the north of the town, running from west to east for ten miles, between two mountains; the one to the north, commonly called Hermon, near mount Tabor; the other Gilboa: in breadth two miles.

IF, an island of France, in Provence, and the most eastern of the three before the harbour of Marfeilles. It is very well fortified, and its port one of the beft in

IGIS, a town of the country of the Grifons, in Caddea, with a magnificent caftle, in which is a cabinet of curiofities, and a handfome library; 23 miles fouth-west of Choira, and 23 fouth of Glaris. E. Lon. 9. 0. N. Lat. 49. 10.

IGLAW, a considerable and populous town of Germany, in Moravia, where they have a manufactory of good cloth, and excellent beer. It is feated on the river Igla, 40 miles west of Brin, and 80 fouth-east of Prague. E. Long. 15. 5. N. Lat. 49. 10.

IGNATIA, in botany, a genus of the monogymia order, belonging to the pentandria class of plants. The calyx is five-toothed; the corolla is long; the fruit an unilocular plum, with many feeds. There is but one species, the amara, a native of India. The fruit of this tree contains the feeds called St Ignatius's beans.

The best account of the plant that has yet appeared, is that fent by father Camelli to Ray and Petiver, and published in the Philosophical Transactions for the year 1609: he observes, that it grows in the Philippine islands, and winds itself about the tallest trees to the top; that it has large, ribbed, bitter leaves, a flower like that of the pomegranate, and a fruit larger than a melon. Some refemble the fruit to a pomegranate, probably from mifapplying Camelli's words. The fruit is covered with a thin, gloffy, blackish, green, and as it were marbled shell, under which is lodged another of a stony hardness: within this is contained a foft, yellow, bitterish pulp, in which lie the feeds or beans, to the number commonly of 24, each covered with a filvery down.

The fame gentleman gives an account of the virtues attributed to these seeds by the Indians; but experience has shown that they are dangerous. Konig relates, that a person, by drinking some of a spirituous tincture of them inftead of aqua vitæ, was thrown into ftrong convulsions; and Dr Grim, that a dram of the feed in fubstance occasioned, for a time, a total deprivation of the fenfes. Others mention violent vomitings and purgings from its use. Neumann hath observed intermitting fevers removed by drinking, on the approach of a paroxyfm, an infusion of some grains of the bean made in carduus water : We are not, however, from hence to look upon this medicine as an uniIgnatius.

These beans (for so ensom requires that we should call them) are about the fize of a moderately large nutmeg; in figure somewhat roundish, but extremely integular, fearcely any two being entirely alike, full of unequal depressions and prominences; in colour, externally, yellowish brown, but when the outer skin is taken off, of a blackish brown, and in part quite blackish; in consistence hard and compact as horn, so as not to be reducible into a powdery form, but by cutting or rafping; for all their hardness, however, they are not proof against worms. When fresh, they have somewhat of a musky finell, which by age is lost; their taste is very bitter, refembled by some to that of centaury.

According to fome, it is from this plant that the

COLUMBO root is obtained.

IGNATIUS Loyota, (canonized), the founder of the well-known order of the [ESUITS, was born at the castle of Loyola, in Biscay, 1491; and became first page to Ferdinand V. king of Spain, and then an officer in his army. In this last capacity, he fignalized himfelf by his valour; and was wounded in both legs at the fiege of Pompeluna, in 1521. To this circumflance the Jefuits owe their origin; for, while he was under cure of his wound, a Life of the Saints was put into his hands, which determined him to forfake the military for the ecclefiaftical profession. His first devont exercise was to dedicate himself to the blessed virgin as her knight: he then went a pilgrimage to the Holy Land; and on his return to Europe, he continued his theological studies in the universities of Spain, though he was then 33 years of age. After this he went to Paris; and in France laid the foundation of this new order, the inflitutes of which he prefented to Pope Paul III. who made many objectious to them, but at last confirmed the institution in 1540. The founder died in 1555, and left his disciples two famous books; I. Spiritual exercises; 2. Constitutions or rules of the order. But it must be remembered, that though these avowed institutes contain many privileges obnoxious to the welfare of fociety, the most diabolical are contained in the private rules intitled Monita fecre-1a, which were not discovered till towards the close of the last century; and most writers attribute these, and even the Constitutions, to Laynex, the fecond general of the order.

IGNATIUS (St), furnamed Theophrastus, one of the apostolical fathers of the church, was born in Syria, and educated under the apostle and evangelist St John, and intimately acquainted with fome other of the apostles, especially St Peter and St Paul. Being fully instructed in the doctrines of Christianity, he was, for his eminent parts and piety, ordained by St John, and confirmed about the year 67 bishop of Antioch, by those two apostles, who first planted Christianity in that city, where the disciples also were first called Christians. Antioch was then not only the metropolis of Syria, but a city the most famous and renowned of any in the east, and the ancient feat of the Roman emperors, as well as of the viceroys and governors. In this important feat he continued to fit fomewhat above 40 years, both an honour and fafe-guard of the Christian religion, till the year 107, when Trajan the emperor, flushed with a victory which he had lately obtained over the Scythians and Daci, about the ninth year of his reign, came to Antioch to make preparations for

a war againft the Parthians and Armenians. He entered the city with the pomp and folemnities of a triumph; and, as his first care usually was about the concernments of religion, he began prefently to inquire into that affair. Christianity had by this time made such a progress, that the Romans grew jealous and uneasy at it. This prince, therefore, had already commenced a perfecution against the Christians in other parts of the empire, which he now resolved to carry on here. However, as he was naturally of a mild disposition, though he ordered the laws to be put in force against them if convicted, yet he forbad them to be fought after.

In this state of assairs, Ignatius, thinking it more prudent to go himself then say to be fent for, of his own accord presented himself to the emperor; and, it is said, there passed a long and particular discourse between them, wherein the emperor expressing a surprise how he dared to transgress the laws, the bishop took the opportunity to affert his own innocency, and to explain and vindicate his faith with freedom. The iffue of this was, that he was cast into prison, and this sentence passed upon him, That, being incurably overrun with superlition, he should be carried bound by foldiers to Rome, and there thrown as a prey to wild beastle.

He was first conducted to Seleucia, a port of Syria, at about to failes dislance, the place where Paul and Barnabas fet fail for Cyprus. Arriving at Smyrna in Lonia, he went to visit Polycarp bishop of that place, and was himself visited by the clergy of the Maian churches round the country. In return for that kindnels, he wrote letters to feveral churches, as the Eptesians, Magnesians, and Trallians, besides the Romans, for their instruction and establishment in the faith; one of these was addressed to the Christians at Rome, to acquaint them with his prefent state, and passionate design on the bished on the country of marrydom which he was now haltening to accompisit.

His guard, a little impatient of their flay, fet fail with him for Trons, a noted city of the leffer Phygia, not far from the ruins of old Troy; where, at bis arrival, he was much refreshed with the news he received of the perfecution cealing in the clurch of Antioch: hither also feveral churches fent their mefengers to pay their reflects to him; and hence too he diptached two epitles, one to the church of Philadelphia, and the other to that of Smyrna; and, to gether with this laft, as Enfebius relates, he wrote privately to Polycarp, recommending to him the care and

infpection of the church of Antioch.

From Troas they failed to Neapolis, a maritime town in Macedonia; thence to Philippia. a Roman colony, where they were entertained with all imaginable kindnefs and courtefy, and conducted forwards on their journey, paling on foot through Macedonia and Epiraus, till they came to Epidanium, a city of Dalmatia; where again taking flippings, they failed through the Adriatic, and arrived at Rhegium. a port-town in Italy; directing their course thence through the Tyrrhenian fea to Putcoli, whence Iguatius defired to proceed by Jand, ambitious to trace the fame way by which St Paul went to Rome; but this wifh was not compiled with; and, after a flay of 24 hours, a profeprous wind quickly carried them to the Roman port, the great harbour and flation for their navy, built near Olkia, at the mouth of the Tyber, about 16 miles

Ignatius from Rome; whither the martyr longed to come, as much defirous to be at the end of his race, as his keepers, weary of their voyage, were to be at the end-

of their journey.

The Christians at Rome, daily expecting his arrival, were come out to meet and entertain him, and accordingly received him with a mixture of joy and forrow; but when fome of them intimated, that poslibly the populace might be taken off from defiring his death, he expressed a pious indignation, intreating them to cast no rubs in his way, nor do any thing that might hinder him, now he was haftening to his crown. There are many fuch expressions as this in his epistle to the Romans, which plainly show that he was highly ambitious of the crown of martyrdom. Yet it does not appear that he rashly sought or provoked danger. Among other expressions of his ardor for fuffering, he faid, that the wild beafts had feared and refused to touch some that had been thrown to them, which he hoped would not happen to him. Being conducted to Rome, he was prefented to the præsect, and the emperor's letters probably delivered concerning him. The interval before his martyrdom was fpent in prayers for the peace and profperity of the church. That his punishment might be the more pompous and public, one of their folemn festivals, the time of their Saturnalia, and that part of it when they celebrated their Sigillaria, was pitched on for his execution; at which time it was their custom to entertain the people with the bloody conflicts of gladiators, and the hunting and fighting with wild beafts. Accordingly, on the 13th kal. January, i. e. December 20. he was brought out into the amphitheatre, and the lions being let loofe upon him, quickly difpatched their meal, leaving nothing but a few of the hardest of his boncs. These remains were gathered up by two deacons who had been the companions of his journey; and being transported to Antioch, were interred in the cemetery, without the gate that leads to Daphne; whence, by the command of the emperor Theodofius, they were removed with great pomp and folemnity to the Tycheon, a temple within the city, dedicated to the public genius of it, but now confecrated to the memory

St Ignatius stands at the head of those Antinicene fathers, who have occasionally delivered their opinions in defence of the true divinity of Christ, whom he calls the Son of God, and his eternal Word. He is also reckoned the great champion of the doctrine of the epifcopal order, as diffinct and superior to that of priest and deacon. And one, the most important, use of his writings respects the authenticity of the holy Scriptures, which he frequently alludes to, in the very expressions as they stand at this day .- Archbishop Usher's edition of his works, printed in 1647, is thought the best : yet there is a fresher edition extant at Amsterdam, where, beside the best notes, there are the

differtations of Usher and Pearson.

St IGNATIUS'S Bean. See IGNATIA.

IGNIS-FATUUS, a kind of light, supposed to be of an electric nature, appearing frequently in mines, maishy places, and near stagnating waters. It was formerly thought, and is still by the superstitious believed, to have fomething ominous in its nature,

and to prefage death and other misfortunes. There Ignition have been inflances of people being decoyed by thefe language. lights into marshy places, where they have perished; whence the names of Ignis-fatuus, Will-with-a-wisp, and Jack-with a lanthorn, as if this appearance was an evil spirit which took delight in doing mischief of that kind. For a further account of the nature and properties of the ignis-fatuus, fee the articles LIGHT and METEOR.

IGNITION, properly fignifies the fetting fire to any fubftance; but the fense is commonly restrained to that kind of burning which is not accompanied with flame, fuch as that of charcoal, cinders, metals,

ftones, and other folid fubitances.

The effects of ignition are first to dislipate what is called the phlogifton of the ignited fubiliance, after which it is reduced to ashes. Vitrification next sollows; and lastly, the substance is totally diffipated in vapour. All these effects, however, depend on the presence of the air; for in vacuo the phlogiston of any fubstance cannot be diffipated. Neither can a body which is totally destitute of philogiston be ignited in fuch a manner as those which are not deprived of it; for as long as the phlogiston remains, the heat is kent up in the body by the action of the external air upon it; but when the phlogiston is totally gone, the air always destroys, instead of augmenting, the heat. Philosophers have therefore been greatly embarrassed in explaining the phenomena of ignition. See PHLOGISTON.

IGNOBILES, among it the Romans, was the defignation of fuch perfons as had no right of using pictures

and statues. See Jus Imaginis.

IGNOMINIA, a species of punishment amongst the Romans, whereby the offender fuffered public shame, either by virtue of the prætor's edict, or by order of the cenfor. This punishment, besides the fcandal, deprived the party of the privilege of bearing any offices, and almost all other liberties of a Roman

IGNORAMUS, in law is a word properly ufed by the grand inquest empanelled in the inquisition of causes criminal and public, and written upon the bill whereby any crime is offered to their confideration. when as they mislike their evidence as defective or too weak to make good the prefentment; the effect of which word fo written is, that all farther inquiry upon that party for that fault is thereby flopped, and he delivered without farther answer. It hath a refemblance with that custom of the ancient Romans, where the judges, when they absolved a person accused, did write A. upon a little table provided for that purpose, i. e. absolvimus; if they judged him guilty, they wrote C. i. e. condemnamus; if they found the cause difficult and doubtful, they wrote N. L. i. e. non liquet.

IGNORANCE, the privation or absence of knowledge. The causes of ignorance, according to Locke, are chiefly thefe three. 1. Want of ideas. 2. Want of a discoverable connection between the ideas we have. 3. Want of tracing and examining our ideas.

IGNORANCE, in a more particular fense, is used to denote illiteracy. Previous to the taking of Rome by the Gauls, fuch grofs ignorance prevailed among the Romans, that few of the citizens could read or write, and T 2

Ignorance the alphabet was almost unknown. During three ages there were no public schools, but the little learning their schools that the little learning their schools but the little learning their little that was may be partly concluded from this circum-

flance, that a nail was usually driven into the wall of the temple of Jupiter Capitolinus, on the 15th of September, to affilt the ignorance of the people in reckoning the years, because they were unacquainted with letters or figures. The driving of the nail was afterwards converted into a religious ceremony, and per-

formed by the Dictator, to avert public calamities.

IGNORANCE, or mistake, in law, a defect of will, whereby a person is excused from the guilt of a crime, when, intending to do a lawful act, he does that which is unlawful. For here the deed and the will acting feparately, there is not that conjunction between them which is necessary to form a criminal act. But this must be an ignorance or miltake of fact, and not an error in point of law. As if a man intending to kill a thief or house-breaker in his own house, by mistake kills one of his own family, this is no criminal action: but if a man thinks he has a right to kill a person excommunicated or outlawed wherever he meets him. and does for this is wilful murder. For a miltake in point of law, which every person of discretion not only may, but is bound and prefumed to know, is, in criminal cases, no fort of desence. Ignorantia juris quod quisque tenetur scire, neminem excusat, is as well the maxim of our own law as it was of the Roman.

IGUANA, in zoology, a fpecies of LACERTA.

Mud-IGUANA. See MURAENA.

IHOR, Johos, or Jor, a town of Afia, hs.Malace, and capital of a province of the fame name in the penisfula beyond the Ganges. It was taken by the Portuguefe in 1603, who deftroyed it, and carried off the cannon; but it has fince been rebuilt, and is now in possession of the Dutch. E. Long. 93. 55. N. Lat. 1.15.

JIB, the foremost fail of a ship, being a large stayfail extended from the outer end of the bowsprit prolonged by the jib-boom, towards the fore-top mast-

head. See SAIL.

The jib is a fail of great command with any fidewind, but efpecially when the fihip is tole hauled, or has the wind upon her beam; and its effort in affing the fhip, or turning her head to leeward, is very powerful, and of great utility, particularly when the

thip is working through a narrow channel.

718-Boom, a boom run out from the extremity of the bowfprit, parallel to its length, and ferving to extend the bottom of the jib, and the flay of the foretop-gallant mast. This boom, which is nothing more than a continuation of the bowsprit forward, to which it may be considered as a top mast, is usually attached to the bowsprit by means of two large boom irons, or by one boom iron, and a cap on the outer end of the bowsprit; or, finally, by the cap without and a throng lashing within, instead of a boom-iron, which is generally the method of fecuring it in small merchant-ships. It may therefore be drawn in upon the bowfprit as occasion requires; which is usually practifed when the ship enters a harbour, where it might very foon be broken or carried away, by the veffels which are moored therein, or passing by under fail.

IIBBEL-AUREZ, the mous aurafuis of the middle

age, an affemblage of many very rocky mountains in Jidda. Africa, in the kingdom of Algiers. Here Mr Bruce met with a face of people much fairer in the com-plexion than any of the nations to the fouthward of Britain : their hair was red, and their eyes blue : they maintain their independence, and are of a favage difposition, so that our traveller found it difficult to approach them with fafety. They are called Neardia; and each of them has a Greek cross in the middle between the eyes, marked with antimony. They are divided into tribes, but, unlike the other Arabs, have huts in the mountains built of mud and straw; and are, by our author, supposed to be a remnant of the Vandals He even thinks that they may be descended from the remainder of an army of Vandals mentioned by Procopius, which was defeated among these mountains. They live in perpetual war with the Moors, and boast that their ancestors were Christians. They pay no taxes.

JIDDA, a town of Arabia, fituated, according to Mr Bruce, ingN. Lat. 28° or 1' E. Long. 39° 16' 45'. It is fituated in a very unwholefome, barren, and defert part of the country. Immediately without the gate to the eaflward is a defert plain filled with the huts of the Bedoweens or country Arabs, built of long bundles of fipartum or bent-grafs put together like facines. These people supply the town with milk and butter. "There is no strring out of the town (fays Mr Bruce) even for a walk, unless for about half a mile in the fouth-side by the sea, where there is a number of stinking pools of flagnant water, which contributes

to make the town very unwholesome."

From the difagreeable and inconvenient fituation of this port, it is probable, that it would have been long ago abandoned, had it not been for its vicinity to Mecca, and the vast annual influx of wealth occasioned by the India trade; which, however, does not continue, but passes on to Mecca, whence it is dispersed all over the east. The town of Jidda itself receives but little advantage, for all the cuftoms are immediately fent to the needy and rapacious sheriff of Mecca and his dependents. " The gold (fays Mr Bruce) is returned in bags and boxes, and passes on as rapidly to the ships as the goods do to the market, and leaves as little profit behind. In the mean time provisions rife to a prodigious price, and this falls upon the townsmen, while all the profit of the traffic is in the hands of strangers; most of whom, after the market is over (which does not last fix weeks), retire to Yemen and other neighbouring countries, which abound in every fort of provision.

From this (earcity, Mr Bruce fuppofes it is thatpolygamy is lefs common here than in any other part of Arabia. "Few of the inhabitants of Jidda (fays our author) can avail themselves of the privilege granted by Mahomet. He cannot marry more than one wife, because he cannot maintain more; and from this, cause arises the want of people and the number of un-

married women."

The trade at Jidda is carried on in a manner which appeared very firange to our traveller. "Nine ships (lays he) were there from India; some of them worth, I suppole, 200,000l. One merchant, a Turk, living at Mecca, 30 hours journey off, where no Christian dares go whilst the continent is open to the Turk for

elcane

Jidda.

comes and favs he will buy none unless he has them all. The famples are shown, and the cargoes of the whole nine ships are carried into the wildest parts of Arabia by men with whom one would not wish to trust himself alone in the field. This is not all; two India brokers come into the room to fettle the price; one on the part of the India Captain, the other on that of the buyer the Turk. They are neither Mahometans nor Christians, but have credit with both. They fit down on the carpet, and take an India shawl which they carry on their shoulder like a napkin, and spread it over their hands. They talk in the mean time indifferent conversation, as if they were employed in no serious business whatever. After about 20 minutes fpent in handling each others fingers below the shawl, the bargain is concluded, fay for nine ships, without one word ever having been fpoken on the fubiect, or pen or ink used in any shape whatever. There never was one instance of a dispute happening in these sales. But this is not all; the money is yet to be paid. A private Moor, who has nothing to support him but his character, becomes responsible for the payment of there cargoes. This man delivers a number of coarfe hempen bags full of what is supposed to be money. He marks the contents upon the bag, and puts his feal upon the string that ties the mouth of it. This is received for what is marked upon it without any one ever having opened one of the bags; and in India it is current for the value marked upon it as long as the bag lasts.

The port of Jidda is very extensive, and contains numberless shoals, small islands, and funk rocks, with deep channels, however, between them; but in the harbour itself ships may ride secure, whatever wind blows. The only danger is in the coming in or going out; but as the pilots are very skilful, accidents are never known to happen. The charts of this harbour, as Mr Bruce informs us, are exceedingly erroneous. While he flaid here, he was defired by Captain Thornhill to make a new chart of the harbour; but finding that it had been undertaken by another gentleman, Captain Newland, he dropped it. He argues in the flrongest terms against the old maps, which he says can be of no use, but the contrary; and he gives it as a characteristic of the Red sea, " scarce to have foundings in any part of the channel, and often on both fides; whilst ashore, foundings are hardly found a boat length from the main. To this, fays he, I will add, that there is fcarce one island on which I ever was, where the boltfprit was not over the land, while there were no foundings by a line heaved over the ftern. Of all the veffels in Jidda, only two had their log-lines properly divided, and yet all were fo fond of their supposed accuracy, as to aver they had kept their course within five leagues between India and Babelmandel. Yet they had made no estimation of the currents without the straits, nor the different very throng ones foon after paffing Socotra; their halfminute glasses, upon a medium, ran 57 seconds; they had made no observations on the tides or currents in the Red fea, either in the channel or in the inward paffage; yet there is delineated in this map a course of

escape, offers to purchase the cargoes of four out of Captain Newland's, which he kept in the middle of these nine ships himself; another of the same cast the channel, full of sharp angles and short stretches; comes and says he will buy none unless he has them you would think every yard was measured and all. The samples are shown, and the cargoes of the sounded!"

JIG. See Music, n° 252.

JIN. See GENII.

ÎKENIL D STREET, one of the four famons ways which the Romans made in England, called Stratum Ieenorum, because it began in the country of the Ieeni, who inhabited Norfolk, Suffolk, and Cambridge-fhire.

ILA, ILAY or Illa, one of the Western Isles of Scotland, lying to the west of Jura, from which it is separated by a narrow channel. It extends 28 miles in length from north to fouth, and is 18 in breadth from east to west. On the east side, it is full of mountains covered with heath; to the fouthward, the land is tolerably well cultivated. In fome parts the inhabitants have found great plenty of limestone, and lead-mines are worked in three different places. The only harbour in Isla is at Lochdale, near the north end of the island. Here are several rivers and lakes well stored with trout, eels, and falmon. In the centre is Loch Finlagan, about three miles in circuit, with the little ifle of that name in the middle. Here the great lord of the ifles once refided in all the pomp of royalty: but his palaces and offices are now in ruins. Inflead of a throne, Macdonald flood on a flone feven feet fquare, in which there was an impression made to receive his feet; here he was crowned and anointed by the bishop of Argyle and seven inferior priests, in pre-sence of the chieftains. This stone still exists. The ceremony (after the new lord had collected his kindred and vaffals) was truly patriarchal. After putting on his armour, his helmet, and his fword, he took an oath to rule as his ancestors had done; that is, to govern as a father would his children; his people in return fwore that they would pay the fame obedience to him as children would to their parent. The dominions of this potentate, about the year 1586, confilted only of Ilay, Jura, Knapdale, and Cantyre; fo reduced were they from what they had been before the deprivation of the great earl of Ross in the reign of James III. Near this is another little ifle, where he affembled his council, Ilanna Corlle, or "the ifland of council;" where 13 judges constantly fat to decide differences among his subjects; and received for their trouble the 1 tth part of the value of the affair tried before them. In the first island were buried the wives and children of the lords of the isles; but their own persons were deposited in the more facred ground of Iona. On the shores of the lake are some marks of the quarters of his Carnauch and Gilli glaffes, " the military of the isles:" the first fignifying a strong man, the last a grim looking fellow. The first were lightarmed, and fought with darts and daggers; the last with sharp hatchets. These are the troops that Shakespeare alludes to, when he speaks of a Donald, who -From the Western Isles

Of Kernes and Callow-glaffes was supplied.

Befides those already mentioned, the lords had a houseand chapel at Laganon, on the fouth fide of Loch-andaal: a strong castle on a rock in the sea, at Dunowaik, at the fouth-east end of the country; for they from that of Man in 1304 .- There is a tradition, that while the Isle of Man was part of the kingdom of the ifles, the rents were for a time paid in this country : those in filver were paid on a rock, still called Creig-a-nione, or "the rock of the filver-rent;" the other, Creg-a-nairgid, or "the rock of rents in kind." These lie opposite to each other, at the mouth of a harbour on the fouth fide of this island. There are feveral forts built on the ifles in fresh water lakes, and divers caverns in different parts of the island, which have been used occasionally as places of strength. The island is divided into four parishes, viz. Kildalton, Kilaron, Kilchoman, and Kilmenie. The produce is corn of different kinds; fuch as bear, which fometimes yields eleven-fold; and oats fix fold. Much flax is raifed here, and about L. 2000 worth fold out of the island in varn, which might better be manufactured on the foot, to give employ to the poor natives. Notwithstanding the excellency of the land, above L. 1000 worth of meal is annually imported. Ale is frequently made in this island of the young tops of heath, mixing two-thirds of that plant with one of malt, fometimes adding hops. Boethius relates, that this liquor was much used among the Picts; but when that nation was extirpated by the Scots, the fecret of making it perished with them. Numbers of cattle are bred here, and about 1700 are annually exported at the price of 50 shillings each. The island is often overstocked, and numbers die in March for want of fodder. None but milch-cows are housed; cattle of all other kinds, except the faddle-horfes, run out during winter.

The number of inhabitants is computed to be between seven and eight thousand. About 700 are employed in the mines and in the fishery: the rest are gentlemen-farmers, and fubtenants or fervants. The women fpin. The fervants are paid in kind; the fixth part of the crop. They have houses gratis: the mafter gives them the feed for the first year, and lends them horses to plough annually the land annexed.

The quadrupeds of this island, as enumerated by Mr Pennant +, are flots, weefels, otters, and hares : the last small, dark-coloured, and bad runners. The birds are eagles, peregrine falcons, black and red game, and a very few ptarmigans. Red-breafted goofanders breed on the shore among the loofe stones, wild geefe in the moors, and herons in the island in Loch guirm. The fifth are plaife, smeardab, large dabs, mullets, ballan, lump fish, black goby, greater dragonet, and that rare fish the lepadogaster of M. Gouan. Vipers swarm in the heath; the natives retain the vulgar error of their flinging with their forked tongues; that a fword on which the poifon has fallen will hifs in water like a red-hot iron; and that a poultice of human ordure is an infallible cure for the bite.

In this island, Mr Pennant informs us, several ancient diversions and superstitions are still preserved: the

made this island their residence after their expulsion power of fascination is as strongly believed here as it was by the shepherds of Italy in times of old.

Nescio quis teneros oculis muhi fascinat agnos? But here the power of the evil-eye affects more the milch-cows than lambs. If the good housewife perceives the effect of the malicious on any of her kine, fhe takes as much milk as she can drain from the enchanted herd (for the witch commonly leaves very little). She then boils it with certain herbs, and adds to them flints and untempered feel : after that the fecures the door, and invokes the three facred perfons. This puts the witch into fuch an agony, that the comes nilling willing to the house, begs to be admitted, to obtain relief by touching the powerful pot: the good woman then makes her terms; the witch reftores the milk to the cattle, and in return is freed from her pains. But fometimes, to fave the trouble of those charms (for it may happen that the diforder may arife from other causes than an evil eye), the trial is made by immerging in milk a certain herb, and if the cows are fupernaturally affected, it inflantly diffills blood. The unfuccefsful lover revenges himfelf on his happy rival by charms potent as those of the shepherd Alphefibæus, and exactly fimilar :

Necte tribus nodis ternos, Amarylli, colores: Necle, Amarylli, modo.

Donald takes three threads of different hues, and ties three knots on each, three times imprecating the most cruel disappointments on the nuptial bed; but the bridegroom, to avert the harm, stands at the altar with an untied shoe, and puts a sixpence beneath his

History furnishes very few materials for the great events or revolutions of Ilay. It feems to have been long a feat of empire, probably jointly with the Isle of Man, as being most conveniently situated for the government of the rest of the Hebrides; for Crovan the Norwegian, after his conquest of that island in 1066, retired and finished his days in Ilay. There are more Danish or Norwegian names of places in this island than any other: almost all the present farms derive their titles from them; fuch as Perlibus, Torridale, Torribolfe, and the like. On the retreat of the Danes it became the feat of their fucceffors the lords of the ifles; and continued, after their power was broken, in the reign of James III. in their descendants the Macdonalds, who held or ought to have held it from the crown. It was in the possession of a Sir James Macdonald, in the year 1598, the same who won the battle of Traii dhruinard. His power gave umbrage to James VI. who directed the lord of Macleod, Cameron of Lochiel, and the Macneiles of Barra, to support the Macleans in another invasion. The rival parties met near the hill of Benbigger, east of Kilarow; a fierce engagement enfued, and the Macdonalds were defeated and almost entirely cut off. Sir James escaped to Spain; but returned in 1620, was pardoned, received a pension, and died the same year last indeed are almost extinct, or at most lurk only a- at Glasgow; and in him expired the last of the great mongst the very meanest of the people. The late- Macdonalds. But the king, irritated by the disturwakes or funerals, like those of the Romans, were at- bances raised by private wars, waged between these and tended with sports, and dramatic entertainments com-other clans, resumed the grant made by his predeces-posed of many parts, and the actors often changed their for, and transferred it to Sir John Campbell of Calder, dreffes fuitably to their characters. The fubject of the who held it on paying an annual feu-duty of five hundrama was historical, and preferved by memory. - The dred pounds therling, which is paid to this day. The

Micheffer, iffand was granted to Sir John as a reward for his nance, and the manner of holding his trident, announce ildefonfer Aldefonfor undertaking the conquelt; but the family confidered that he has just imposed filence on the mutinous waves; it as a dear acquifition, by the lofs of many gallant followers, and by the expences incurred in support

ILCHESTER, a town of Somerfetshire in England, feated on the river Yeovil, 129 miles from Loudon, is fo called, because it once had a castle, and flands on the river Ivel. It is a place of great antiquity, as appears by the Roman coins which are fometimes dug up. It is likewise evident, from the ruins and from two towers on the bridge, that it was once a large place, and encompassed with a double wall. It also had feveral parish churches, though now but one. It is governed by two bailiffs, who with the twelve burgeffes are lords of the manor. In the reign of Edward III, the affizes for the county were fixed here. which have fince been held alternately at Wells, Taunton, and Bridgewater. The knights of the shire are always chosen here, and it is the place for the countycourts and jail. On the latter is its chief dependence. and therefore it cannot be very polite. It is noted for being the birth-place of Roger the famous Friar Bacon. Ilchester is an earldom in the Fox family.

ILDEFONSO (Sr), a celebrated royal refidence of Spain, diftant about two miles from Segovia. It was erected by Philip V. in the midft of a folitary wood, and in the bosom of steep mountains. It is chiefly remarkable for its gardens. There is nothing magnificent in the palace, particularly in its exterior appearance. The front on the fide of the garden is of the Corinthian order, and not destitute of elegance, Here are the king's apartments, which look upon a parterre furrounded with vafes and marble statues, and a cascade which, for the richness of its decorations,

may be compared with the finest of the kind.

The purity and clearness of the water is indeed incomparable. Philip V. could not, in this respect, be better ferved by nature. From the mountains which fhade the palace descend several rivulets, which supply the refervoirs. These waters answer the double purpofe of fupplying numerous fountains, and of diffusing life and verdure through the magnificent gardens, the fight of which alone is a fufficient recompence for a journey into Spain. They are on the infide a league in circumference. The inequality of the ground af-fords every moment new points of view. The principal alleys answer to different fummits of neighbouring mountains; and one in particular produces the molt agreeable effect. It is terminated at one end by the grand front of the palace. From this point are feen, at one view, five fountains, ornamented with elegant groups, rifing into an amphitheatre, above which appear the fummits of lofty mountains. The most elevated of these groups is that of Andromeda fastened to a rock. When feen at a little diffance it is perhaps defective, because the rock appears too diminutive by the fide of the monster which threatens Andromeda; and of Perfeus, by whom it is attacked; but the whole contributes to the beauty of the view. The most remarkable of the five groups is that of Neptune.

" Genius (fays M. Bourgoanne+) prefided at the Spain, 1. 68. composition and in the choice of the situation; the deity of the ocean appears erect, furrounded by his

and the calm which reigns in the bason, defended from every wind by the triple wall of verdure by which it is surrounded, seem to indicate that he has not iffued his commands in vain. Often have I feated myfelf, with Virgil in my hand, by the fide of this filent water, under the shade of the verdant foliage, nor ever did I fail to recollect the famous Quas Ero!

"There are other fountains worthy of the attention of the curious; fuch as that of Latona, where the limpid sheaves, some perpendicularly, and others in every direction, fall from the hoarfe throats of the Lycian peafants, half transformed into frogs, and fpouting them forth in such abundance, that the statue of the goddess disappears under the wide mantle of liquid crystal; that also of Diana in the bath, furrounded by her nymphs; in the twinkling of an eye all the chafte court is hidden beneath the waters; the spectator imagines he hears the whiltling of aquatic birds, and the roaring of lions, from the place whence this momentary deluge escapes by a hundred canals. The fountain of Fame is formed by a fingle jet-d'eau, which rife 130 feet, exhibiting to the distance of feveral leagues round the triumph of art over nature. and falls in a gentle shower upon the gazing spectators. There are some situations in the gardens of St Ildefonfo, whence the eye takes in the whole of the greater part of these fountains, and where the ear is delighted with the harmony of their murmurs. The traveller who wishes to charm all his fenses at once. must take his station on the high flat ground in front of the king's apartment. In the thick part of the foliage are contrived two large arbours, from the top of which are feen tewenty crystal columns rising intothe air to the height of the furrounding trees, mixing their resplendent whiteness with the verdure of the foliage, uniting their confused noise to the ruftling of the branches, and refreshing and embalming the air: if the traveller here experience no pleafing fenfations. let him return home, he is utterly incapable of feeling either the beauties of art or nature.

"The reader may here imagine (continues our author) my enthusiasim too extravagant. He is mistaken; let him follow me to the great refervoir of abundant and limpid waters. He will have to climb for fome minutes, but will not regret the trouble he has taken. Let us suppose ourselves arrived at the long and narrow alley which takes up the whole of the upper part of the gardens; proceed to the middle, and turn your face toward the castle. To the valt horizon around you, no other boundaries are discovered but those which limit the human fight; these alone prevent you from discovering the Pyrences. Observe the fleeple, which feems but a point in the immense extent : you will perhaps imagine it to be that of the parish church of St Ildefonso; but, in reality, it is the cathedral of Segovia, at two leagues distance. The gardens, through which you have passed, become narrower to the eye. You suppose yourfelf close to the royal habitation; the alleys, fountains, and parterres, have all disappeared; you see but one road, which, inthe form of a veffel, upon the prow of which you feem to fland, has its ftern on the top of the palace. Afmarine court. His attitude, his threatening counte- terward turn and take a view of the little lake behind

the fides of the mountain in front, meet in this refervoir, and thence descend by a thousand invisible tubes to other refervoirs, whence they are spouted in columns strangers. The birds, drawn by their clearness, come to fkim and agitate their cryftal. The image of the tufted woods which furround them is reflected from their immoveable furface, as is also that of some simple and rural houses, thrown, as by accident, into this delightful picture, which Lorrain would have imitated, but perhaps could not have imagined. The opposite bank is obscured by thick shades. Some hollows, overshadowed by arching trees, seem to be the afylums of the Naiades. Difturb them not by indifcreet loquacity, but filently admire and meditate.

" It is impossible, however, not to go to the source of these waters; let us follow the meandring of their courfe, and observe the winding paths which there terminate, after appearing and disappearing at intervals through the copie. Let us liften to the bubbling of the rivulets which from time to time escape from our fight, and haften to the rendezvous affigned them by the descendants of Louis XIV. They formerly loft themselves in the valleys, where they quenched the thirst of the humble inhabitants, but are now confecrated to the pleafures of kings. Afcending the back of the pyramidical mountain, behind which their fource is concealed, we arrive at the wall which confines a part of them in the garden, and which was hidden by the trees; nothing, however, ought here to recal to mind exclusive property and flavery. Woods, waters, and the majestic folitude of mountains, which are at a diflance from the tumult of courts and cities, are the property of every man .- Beyond this wall, which forms the exterior enclosure of the gardens, is an empty and flat ground, where the infant Don Louis, brother to the king, chose a place which he consecrated to cultivation. Farther on, the mountain becomes more fleep, and is covered with trees to its fummit. Let us now return; as we feek amusement and not fatigue. We will follow the course of the waters, they descend in bubbling streams from one level of the gardens to the other. In their course, in one place they water the feet of the trees, in others they cross an alley to nourish more slowly the plants of a parterre. From the bason of Andromeda they run between two rows of trees in the form of a canal, the too fudden inclination of which is taken off by cascades and windings. They receive and carry with them from the gardens the rivulets; which after having played amongst the gods and nymphs, and moistened the throats of the Iwans, tritons, and lious, humbly defcend under ground. and run on into the bosom of the neighbouring meadows, where they fulfil purpoles less brilliant but more

useful. "We must not quit these magnificent gardens without flopping at a place which appears to promife much, but produces not any very great effect. This is the

Ildefonfo. you, of which the irregular borders do not, like what the centre is the group of Pandora, the only one which Ildefonfo. we call our English gardens, merely ape the disorder is of whitened stone, all the others are of white marble of nature. Nature herfelf has traced them, except on or lead painted of a bronze colour. Eight alleys anthe fide where you fland. This ftraight alley is uni- fwer to this centre, and each is terminated by a founted at each end to the curve which furrounds the re- tain. Plats of verdure fill up the intervals between the fervoir. The waters, which fream in abundance from alleys, and each has an altar under a portico of white marble by the fide of a bason sacred to some god or goddefs. Thefe eight altars, placed at equal diffances, and decorated among other jets-d'eau, have two which or sheets upon the flowery soil to which they were rise in the form of tapers on each side of their divinities. This cold regularity displeased Philip V. who a little before his death, when vifiting the gardens, made fome fevere reproaches to the inventor upon the fubject. Philip had not the pleasure of completely enjoying what he had created; death furprifed him when the works he had begun were but half finished. The undertaking was however the most expensive one of his reign. The finances of Spain, fo deranged under the princes of the house of Austria (thanks to the wife calculations of Orry, to the fubfidies of France, and still more to the courageous efforts of the faithful Castilians), would have been sufficient for three-long and ruinous wars, and for all the operations of a monarchy which Philip V. had conquered and formed anewas well as to have refifted the shocks of ambition and political intrigue; but they funk beneath the expensive

efforts of magnificence."

It is fingular that the caftle and gardens of St Ildefonfo should have cost about 45,000,000 of piastres, precifely the fum in which Philip died indebted. This enormous expence will appear credible, when it is known that the fituation of the royal palace was at the beginning of this century the floping top of a pile of rocks; that it was necessary to dig and hew out the stones, and in feveral places to level the rock; to cut out of its fides a paffage for a hundred different canals, to carry vegetative earth to every place in which it was intended to fubilitute cultivation for sterility, and to work a mine to clear a passage to the roots of the numerous trees which are there planted. All these efforts were crowned with fuccefs. In the orchards, kitchen gardens, and parterres, there are but few flowers, espaliers, or plants, which do not thrive; but the trees, naturally of a lofty growth, and which confequently must strike their roots deep into the earth, already prove the infufficiency of art when it attempts to ftruggle against nature. Many of them languish with withered trunks, and with difficulty keep life in their almost naked branches. Every year it is necessary to call in the aid of gunpowder to make new beds for those which are to supply their place; and none of them are covered with that tufted foliage which belongs only to those that grow in a natural foil. In a word, there are in the groves of St Ildefonfo, marble statues, basons, cascades, limpid waters, verdure, and delightful prospects, every thing but that which would be more charming than all the reft, thick shades.

The court of Spain comes hither annually during the heat of the dog-days. It arrives towards the end of July, and returns at the beginning of October. The fituation of St Ildefonfo, upon the declivity of the mountains which feparate the two Castiles, and fronting a vast plain where there is no obstacle to the pasfage of the north wind, renders this abode delightful fquare of the eight alleys, Plaça de las ocho calles. In in fummer. The mornings and evenings of the hottest

Tlerda, days are agreeably cool. Yet as this palace is upwards of 20 leagues from Madrid, and half of the road which leads to it croffes the broad tops of mountains, extremely fleep in many places, it is much more agreeable to the lovers of the chace and folitude than to others.

ILERDA (anc. geog.), the capital of the Higertes; fituated on an eminence between the rivers Sicoris and Cinga: An unhappy city, often befieged, and often taken, because lying exposed to the incursions from Gaul; and under Gallienus it was destroyed by the Germans. Now LERIDA, in Catalonia, on the river

ILEX, the HOLM or HoLLY Tree: A genus of the tetragynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 43d order, Dumofa. The calyx is quadridentated; the corolla rotaceous; there is no ftyle; the berry is

monospermous.

There are feveral species of this genus; but the most remarkable is the aquifolium, or common holly. Of this there are a great number of varieties with variegated leaves, which are propagated by the nurfery-gardeners for fale, and fome years past were in very great esteem, but at present are but little regarded, the old tafte of filling gardens with shorn evergreens being pretty well abolished; however, in the disposition of clumps, or rather plantations, of evergreen trees and fhrubs, a few of the most lively colours may be admitted, which will have a good effect in the winter feafon, if they are properly disposed.

The best of these varieties are the painted lady holly, British holly, Bradley's best holly, phyllis or creamholly, milkmaid holly, Prichet's best holly, gold-edged hedgehog holly, Chyney's holly, glory-of-thewest holly, Broaderick's holly, Partridge's holly, Herefordshire white holly, Blind's cream holly, Longstaff's holly, Eales's holly, filver-edged hedgehog holly. All these varieties are propagated by budding or grafting them upon flocks of the common green holly; there is also a variety of the common holly with fmooth leaves; but this is frequently found intermixed with the prickly-leaved on the same tree, and often on the fame branch there are both forts of leaves.

The common holly grows naturally in woods and forefls in many parts of England, where it rifes from 20 to 30 feet high, and fometimes more, but their ordinary height is not above 25 feet : the ftem by age becomes large, and is covered with a greyish smooth bark; and those trees which are not loped or browfed by cattle, are commonly furnished with branches the great est part of their length. fo form a fort of cone; the branches are garnished with oblong oval leaves, of a lucid green on their upper furface, but are pale on their under, having a ftrong midrib : the edges are indented and waved, with sharp thorns terminating each of the points, fo that some of the thorns are raised upward, and others are bent downward, and being very stiff they, are troublesome to handle. The leaves are placed alternate on every fide of the branches; and from the base of their footstalks come out the flowers in clusters, standing on very short footstalks; each of thefe fustain five, fix, or more flowers. They are of a dirty white, and appear in May; but are succeeded by roundish berries, which turn to a beautiful red a-Vol. IX. Part I.

bout Michaelmas, and continue on the trees, if they are not destroyed, till after Christmas.

The common holly is a very beautiful tree in winter: therefore deferves a place in all plantations of evergreen trees and shrubs, where its thining leaves and red berries make a fine variety; and if a few of the best variegated kinds are properly intermixed, they will enliven the fcene. It is propagated by feeds, which never come up the first year, but lie in the ground as the haws do: therefore the berries should be buried in the ground one year, and then taken up and fown at Michaelmas, upon a bed exposed only to the morning fun: the following fpring the plants will appear, which mult be kept clean from weeds; and if the fpring should prove dry, it will be of great service to the plants if they are watered once a week; but they must not have it oftener, nor in too great quantity, for too much moisture is very injurious to these plants when young. In this feed bed the plants may remain two years; and then should be transplanted in the autumn. into beds at about fix inches afunder, where they may stand two years longer; during which time they must be constantly kept clean from weeds; and if the plants have thriven well, they will be ftrong enough to transplant where they are defigned to remain; for when they are transplanted at that age, there will be less danger of their failing, and they will grow to a larger fize than those which are removed when they are much larger; but if the ground is not ready to receive them at that time, they should be transplanted into a nurfery in rows at two feet diffance. and one foot afunder in the rows, in which place the plants may remain two years longer; and if they are defigned to be grafted or budded with any of the variegated kinds, that should be performed after the plants have grown one year in the nursery: but the plants fo budded or grafted should continue two years after in the nursery, that they may make good shoots before they are removed; though the plain ones should not stand longer than two years in the nursery, because when they are older they do not transplant fo well. The best time for removing hollies is in the autumn, especially in dry land; but where the foil is cold and moift, they may be tranfplanted with great fafety in the foring, if the plants are not too old, or have not flood long unremoved, for if they have, there is great doubt of their growing when removed.

Ufes. Sheep in the winter are fed with croppings of holly. Birds eat the berries. The bark fermented and afterwards washed from the woody fibres, makes the common bird-lime. The plant makes an impenetrable fence, and bears cropping; however, it is not found in all respects to answer for this purpose equally well with the hawthorn. The wood is used in fineering, and is fometimes flained black to imitate ebony. Handles for knives and cogs for mill-wheels are made of it. It is also made into hones for whetting of razors. Mr Miller fays, he has feen the floor of a room laid with compartments of holly and mahogany, which had a very pretty effect.

II.FR COMB, a town of Devonshire, seated on the Severn fea, almost opposite to Swansea in Glamorganshire, 186 miles from London. It is a populous, rich, trading fea-port, especially with herrings in the

Briftol-channel; noted for maintaining conflant lights to direct the failors; for its convenience of building and reparing thips; and for the fafe thelter thips from Ireland find here, when it is extremely dangerous for them to run into the mouth of the Taw, which they call Barnstaple-water; and this is one reason why the Barnstaple merchants do so much of their business at this port. The harbour, with its quay, warp house, light-house, pilot-boats, and tow-boats, were formerly maintained at the expence of the ancestors of the lord of the manor; and then it had a quay or pier 850 feet long; but by time and the violence of the fea all went to decay; to remedy which, the parliament paffed an act in 1731, for both repairing and enlarging the piers, harbour, &c. It is governed by a mayor, bailiffs, &c. and confifts chiefly of one street of scattered houses almost a mile long. The parish is large, containing feveral tythings and manors.

ILIAC PASSION, a violent and dangerous kind of colic; called also volvulus, miserere mei, and chordapsus. It takes its name from the intestine ilion, on account of its being usually affected in this distemper; or perhaps from the Greek verb "haps "to wind or twift"; whence also it is the Latins call it volvulus. See ME-

DICINE Index. ILIAD, the name of an ancient epic poem, the first

and finest of those composed by Homer.

The poet's defign in the Iliad was to show the Greeks, who were divided into feveral little states, how much it was their interest to preserve a harmony and good understanding among themselves; for which end he fets before them the calamities that befel their ancestors from the wrath of Achilles, and his misunder-Randing with Agamemnon; and the advantages that afterwards accrued to them from their union. The iliad is divided into 24 books or rhapfodies, which are marked with the letters of the alphabet.

ILISSUS, a river running to the east of Athens; which, with the Eridanus running on the west side, falls below the city into the fea. Sacred to the mufes, called Ilifliades; on whose bank their altar stood, and where the lustration in the less mysteries was usual-

ly performed.

ILIUM, ILION, or Ilios, (anc. geog.) a name for the city of Troy, but most commonly used by the poets, and diftinguished by the epithet Vetus; at a greater distance from the sea than what was afterwards called Ilium Novum, and thought to be the Ilienfium Pagus of Strabo. New or modern Ilium was a village nearer the fea, with a temple of Minerva; where Alexander, after the battle of Granicus, offered gifts, and called it a city, which he ordered to be enlarged. His orders were executed by Lysimachus, who encompassed it with a wall of 40 stadia. It was afterwards adorned by the Romans, who granted it immunities as to their mother-city. From this city the Ilias of Homer takes its name, containing an account of the war carried on between the Greeks and Trojans on account of the rape of Helen; a variety of difasters being the confequence, gave rife to the proverb Ilias Malorum.

ILKUCH, a royal town of Poland, in the palatimate of Cracow, remarkable for its filver mines mixed with lead. It is feated in a barren and mountainous country, in E. Long. 20. O. N. Lat. 50. 26.

ILLECEBRUM, in botany: A genus of the mo- Illecebrum nogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 12th order, Holoracea. The calyx is pentaphyllous, and cartilaginous; there is no corolla; the fligma is fimple; the capfule quinquevalved, and monospermous. There are feveral species, of which the most remarkable are the paronychia and the capitatum. Both these have trailing stalks near two feet long, which fpread on the ground, garnished with small leaves like those of knot-grass. The heads of the slowers come out from the joints of the stalks, having neat filvery bractea furrounding them, which make a pretty appear-Their flowers appear in June, and there is generally a fuccession of them for at least two months:

and when the autumn proves warm, they will ripen their feeds in October. They are propagated by feeds which should be fown in a bed of light earth in the beginning of April: the plants will come up in May, when they should be kept clean from weeds till they are fit to remove. Some should be planted in small pots, and the rest in a warm border, observing to water and shade them till they have taken new root. These plants are sometimes killed in severe winters: for which reason it is directed to plant some of them in pots, that they may be sheltered during that season.

ILLENOIS, a people of North America, inhabiting a country lying near a large lake of the fame name (called also Michigan), formed by the river St Laurence. The country is fertile; and the people plant Indian corn, on which they chiefly fubfift. They are civil, active, lively, and robust; and are much less cruel in their dispositions than the other Indian nations. They are, however, faid to be great libertines, and to marry a number of wives; but some of their

villages have embraced Christianity.

ILLICIUM, in botany: A genus of the pentagynia order, belonging to the dodecandria class of plants; and in the natural method ranking with those of which the order is doubtful. The calyx is tetraphyllous, and deciduous; there are eight petals, and eight petaloid fubulated nectaria. There are 16 stamina with bifid antheræ; the capfules are ovate, compressed, and monospermous. There are two species, viz. 1. The floridanum, with red flowers, and very odorous fruit. It is a native of China. 2. The anisatum, a native of the woods of China and Japan. It rifes with an erect branched stem to the height of a cherry-tree; and is covered with an ash-coloured bark, under which is another bark that is green, fleshy, somewhat mucous, and of an aromatic tafte, combined with a small degree of aftringency. The wood is hard and brittle; the pith small in quantity, fungous, and of a green herbaceous colour. The leaves resemble those of laurel; the flowers, in some fort, those of narcissus. These last generally stand single, are of a pale white, and confift of 16 petals, which differ in their form. The extremity of the flower-stalk being continued into the germen or feed-bud of the flower, forms eight conjoined capfules, or one deeply divided into eight parts. Of these capsules, some frequently decay; the rest inclose each a fingle feed, fomewhat refembling that of palma christi, and which, when the hardish corticle. that closely covers and involves it is broken, exhibits a kernel that is white, fleshy, fost, and of a vapid taffe,

Illumina tafte. The bonzes, or priefts of China and Japan, inting. fuse into the inhabitants a superstitious belief, that the gods are delighted with the prefence of this tree. Hence they generally place before their idols gar-lands and bundles made of the branches. A fimilar opinion the Bramins inculcate into the Indians, of the Malabar fig, or ficus religiofa. The bark of the anifetree, reduced to powder, and equally burnt, the public watchmen in Japan, by a very curious contrivance defcribed by Kempfer, render ufeful in the measuring of time during the darkness of the night. The same powder is frequently burnt in brazen veffels on the Japanefe altars, as incense is in other countries, from a belief that the idols in whose honour the ceremony is performed are greatly refreshed with the agreeable fragrancy of its odour. It is remarkable, that a branch of this tree being added to the decoction of the poifonous fish, termed by the Dutch de opblafer (a fish the most delicate, if the poisonous matter be first properly expelled), increases its noxious quality, and exafperates the poifon to an aftonishing degree of activity and power.

ILLUMINATING, a kind of miniature painting, anciently much practifed for illustrating and adorning books. Befides the writers of books, there were artifts whose profession was to ornament and paint manuferipts, who were called illuminators ; the writers of books first finished their part, and the illuminators embellished them with ornamented letters and paintings. We frequently find blanks left in manuscripts for the illuminators, which were never filled up. Some of the ancient manufcripts are gilt and burnished in a style superior to later times. Their colours were excellent, and their skill in preparing them must have been very

The practice of introducing ornaments, drawings, emblematical figures, and even portraits, into manu-fcripts, is of great antiquity. Varro wrote the lives of feven hundred illustrious Romans, which he enriched with their portraits, as Pliny attests in his Natural History (lib. xxxv. chap. 2.) Pomponius Atticus, the friend of Cicero, was the author of a work on the actions of the great men amongst the Romans, which he ornamented with their portraits, as appears in his life by Cornelius Nepos (chap. 18.) But these works have not been transmitted to posterity. There are, however, many precious documents remaining, which exhibit the advancement and decline of the arts in different ages and countries. These inestimable paintings and illuminations display the manners, customs, habits ecclefiaftical, civil, and military, weapons and instruments of war, utenfils and architecture of the ancients; they are of the greatest use in illustrating many important facts relative to the history of the times in which they were executed. In these treasures of antiquity are preserved a great number of specimens of Grecian and Roman art, which were executed be-fore the arts and sciences fell into neglect and contempt. The manuscripts containing these specimens form a valuable part of the riches preferved in the principal libraries of Europe. The Royal, Cottonian, and Harleian libraries, as also those in the two universities in England, the Vatican at Rome, the imperial at Vienna, the royal at Paris, St Mark's at Venice, and many

A very ancient MS. of Genefis, which was in the Illumina-Cottonian library, and almost destroyed by a fire in 1731, contained two hundred and fifty curious paintings in water colours. Twenty-one fragments, which escaped the fire, are engraven by the society of antiquaries of London. Several specimens of curious paintings also appear in Lambecius's catalogue of the imperial library at Vienna, particularly in Vol. III. where forty-eight drawings of nearly equal antiquity with those in the Cottonian library are engraven; and feveral others may be found in various catalogues of the Italian libraries. The drawings in the Vatican Virgil made in the fourth century, before the arts were entirely neglected, illustrate the different subjects treated of by the Roman poet. A miniature drawing is prefixed to each of the gospels brought over to England by St Augustin in the fixth century, which is preferved in the library of Corpus Christi college, Cambridge: in the compartments of those drawings are depicted representations of several transactions in each gofpel. The curious drawings, and elaborate ornaments in St Cuthbert's gospels made by St Ethelwald, and now in the Cottonian library, exhibit a striking specimen of the state of the arts in England in the feventh century. The fame may be observed with respect to the drawings in the ancient copy of the four gospels preserved in the cathedral church of Litchfield, and those in the Codex Rushworthianus in the Bodleian library at Oxford. The life of St Paul the hermit, now remaining in Corpus Christi college, Cambridge, (G 2), affords an example of the ltyle of drawing and ornamening letters in England in the eighth century; and the copy of Prudentius's Psycomachia in the Cottonian library (Cleop. c. 8.) exhibits the ftyle of drawing in Italy in the ninth century. Of the tenth century there are Roman drawings of a fingular kind in the Harleian library (N° 2820.) N°s 5280, 1802, and 432, in the fame library, contain specimens of ornamented letters, which are to be found in Irish MSS. from the twelfth to the fourteenth century. Cædmon's Poetical Paraphrase of the book of Genesis, written in the eleventh century, which is preferved amongst F. Junius's MSS. in the Bodleian library, exhibits many specimens of utenfils, weapons, instruments of mufic, and implements of husbandry used by the Anglo-Saxons. The like may be feen in extracts from the Pentateuch of the same age, in the Cottonian library (Claud. B. 4.) The manuscript copy of Terence in the Bodleian library (D. 17.) difplays the dreffes, masks, &c. worn by comedians in the twelfth century. if not earlier. The very elegant Pfalter in the library of Trinity College, Cambridge, exhibits specimens of the art of drawing in England in the same century. The Virgil in the Lambeth library of the 13th century (No 471.), written in Italy, shows both by the drawings and writing, that the Italians produced works much inferior to ours at that period. The copy of the Apocalypse in the same library (No 209), contains a curious example of the manner of painting in the fourteenth century .- The beautiful paintings in the history of the latter part of the reign of king Rich. II. in the Harleian library (No 1319), afford curious fpecimens of manners and customs, both civil and military, at the close of the fourteenth and in the beginning of the fifteenth century; as does No 2278 U 2

Illumina. in the fame library .- Many other inflances might be produced; but those who desire farther information Illumined may confult Strutt's Regal and Ecclefialtical Antiqui-

ties, 4to, and his Horda-Angel-cynnan lately published in three vols.

This art was much practifed by the clergy, and even by fome in the highest stations in the church. "The famous Ofmund (fays Bromton), who was confecrated bishop of Salisbury A. D. 1076, did not disdain to spend some part of his time in writing, binding, and illuminating books." Mr Strutt, as already noticed, has given the public an opportunity of forming fome judgment of the degree of delicacy and art with which these illuminations were executed, by publishing prints of a prodigious number of them, in his Regal and ecclefiaftical antiquities of England, and View of the customs, &c. of England. In the first of these works we are presented with the genuine portraits, in miniature, of all the kings, and feveral of the queens of England, from Edward the Confessor to Henry VII. mostly in their crowns and royal robes, together with the portraits of many other eminent persons of both fexes.

The illuminators and painters of this period feem tohave been in possession of a considerable number of colouring materials, and to have known the arts of preparing and mixing them, fo as to form a great variety of colours: for in the specimens of their miniaturepaintings that are still extant, we perceive not only the five primary colours, but also various combinations of them. Though Strutt's prints do not exhibit the bright and vivid colours of the originals, they give us equally a view, not only of the persons and dresses of our ancestors, but also of their customs, manners, arts, and employments, their arms, ships, houses, furniture, &c. and enable us to judge of their skill in drawing. The figures in those paintings are often fliff and formal; but the ornaments are in general fine and delicate, and the colours clear and bright, particularly the gold and azure. In fome of these illuminations the paffions are strongly painted. How strongly, for example, is terror painted in the faces of the earl of Warwick's failors, when they were threatened with a shipwreck, and grief in the countenances of those See Strutt, who were present at the death of that hero *? After the introduction of printing; this elegant art of illuminating gradually declined, and at length was quite

neglected. Before concluding, it may not be improper to obferve, that from the fifth to the tenth century, the miniature paintings which we meet with in Greek MSS. are generally good, as are some which we find among those of Italy, England, and France. From the tenth to the middle of the fourteenth century they are commonly very bad, and may be confidered as fo many monuments of the barbarity of those ages; towards the latter end of the fourteenth, the paintings in manufcripts were much improved; and in the two fucceeding centuries, many excellent performances were produced, especially after the happy period of the re ftoration of the arts, when great attention was paid to the works of the ancients, and the study of antiquity became fashionable.

58.

ILLUMINATORS. See ILLUMINATING. ILLUMINED, ILLUMINATI, a church term, anci-

ently applied to fuch persons as had received baptism. Illumined. This name was occasioned by a ceremony in the baptifm of adults; which confided in putting a lighted taper in the hand of the person baptized, as a symbol of the faith and grace he had received in the facra-

Image.

ILLUMINED, Illuminati, is also the name of a sect of heretics, who fprang up in Spain about the year 1575, and were called by the Spaniards Alambrados. principal doctrines were, that by means of a fublime manner of prayer, which they had attained to, they entered into fo perfect a flate, that they had no occasion for ordinances, sacraments, nor good works; and that they could give way, even to the vilest actions, without fin. The feet of Illumined was revived in France in the year 1634, and were foon after joined by the Guerinets, or disciples of Peter Guerin, who together made but one body, called also ILLUMINED ; but they were so hotly pursued by Louis X:II. that. they were foon destroyed. The brothers of the Rofy. Crofs are fometimes also called Illumined. ROSYCRUSIAN.

ILLUSTRIOUS, ILLUSTRIS, was heretofore, in the Roman empire, a title of honour peculiar to people of a certain rank. It was first given to the most distinguished among the knights, who had a right to bear the latus clayus : afterwards, those were intitled illustrious who held the first rank among those called bonorati; that is, the præfecti prætorii, præfecti urbis, treasurers, comites, &c.

There were, however, different degrees among the illustrious: as in Spain they have grandees of the first and fecond class, so in Rome they had their illustres, whom they called great, majores; and others less, called illustres minores .- For instance; the præfectus prætorii was a degree below the mafter of the offices, though they were both illustres.

The Novels of Valentinian diftinguish as far as five kinds of illustres; among whom, the illustres administratores bear the first rank.

ILLYRICUM, (Solum. perhaps understood) Livy, Herodian, St. Paul; called Illyris by the Greeks, and fometimes Illyria: the country extending from the Adriatic to Pannonia thus called. Its boundaries are variously affigned. Pliny makes it extend in length from the river Arfia to the Drinius, thus including Liburnia to the west, and Dalmatia to the east: which is also the opinion of Ptolemy; who fettles its limits from mount Scardus and the Upper Moesia on the east, to Istria in the west. A Roman province, divided by Augustus into the Superior and Inferior, but of which the limits are left undetermined both by ancient hiflorians and geographers. Illyrii the people; called Illyres by the Greeks. The country is now called Sclavonia.

ILLYRIUS, (Matthias, Flaccus, or Francowitz), one of the most learned divines of the Augsburgh confession, born in Istria, anciently called Illyrica, in 1520. He is faid to have been a man of vast genius, extensive learning, of great zeal against Popery; but of such a reftless and passionate temper, as overbalanced all his good qualities, and occasioned much disturbance in the Protestant church. He published a great number of books, and died in 1575.

IMAGE, in a religious sense, is an artificial repre-

Image. fentation or fimilitude of fome person or thing, used either by way of decoration and ornament, or as an object of religious worship and adoration; in which last fense, it is used indifferently with the word IDOL.

The noble Romans preferved the images of their ancestors with a great deal of care and concern, and had them carried in procession at their funerals and triumphs: thefe were commonly made of wax, or wood, though fometimes of marble or brafs. They placed them in the veltibules of their houses; and they were to flay there, even if the houses happened to be fold, it being accounted impious to displace them. Appius Claudius was the first who brought them into the temples, in the year of Rome 259, and he added infcriptions to them, showing the origin of the persons reprefented, and their brave and virtuous atchievements .- It was not, however, allowed for all, who had the images of their ancestors in their houses, to have them carried at their funerals; this was a thing only granted to fuch as had honourably discharged themfelves of their offices : for those who failed in this refoect, forfeited that privilege; and in case they had been guilty of any great crime, their images were broken in pieces. See IGNOBILES and JUS.

The Jews absolutely condemn all images, and do not fo much as fuffer any flatues or figures in their houses, much less in their fynagogues or places of

worship.

The use and adoration of images are things that have been a long time controverted in the world.

It is plain, from the practice of the primitive church, recorded by the earlier fathers, that Christians, for the first three centuries after Christ, and the greater part of the fourth, neither worshipped images nor used them in their worship. However, the greater part of the Popish divines maintain, that the use and worship of images were as ancient as the Christian religion itself: to prove this, they alledge a decree, faid to have been made in a council held by the Apofiles at Antioch, commanding the faithful, that they may not err about the object of their worship, to make images of Christ and worship them. Baron. ad ann. 102. But no notice is taken of this decree, till 700 years after the Apostolic times, after the dispute about images had commenced. The first instance that occurs in any credible author of images among Chriftians, is that recorded by Tertullian de Pudicit. c. 10. of certain cups, or chalices, as Bellarmine pretends. on which was represented the parable of the good shepherd carrying the loft sheep on his shoulders : but this instance only proves, that the church, at that time. did not think emblematical figures unlawful ornaments of cups or chalices. Another inftance is taken from Eusebius, Hift. Eccl. lib. vii. cap. 18. who fays, that in his time there were to be feen two brafs statues in the city of Paneas or Cæfarea Philippi; the one of a woman on her knees, with her arms firetched out, the other of a man over against her, with his hand extended to receive her: these statues were faid to be the images of our Saviour and the woman whom he cured of an iffue of blood. From the foot of the statue reprefenting our Saviour, fays the historian, fprung up an exotic plant, which, as foon as it grew to touch the border of his garment, was faid to cure all forts of diftempers. Eufebius, however, vouches none of thefe things; nay, he supposes that the woman who erected

this statue of our Saviour was a pagan, and ascribes it Image. to a pagan, cultom. Farther, Philostorgius, Eccl. Hift. lib. vii. c. 3. expressly fays, that this statue was carefully preserved by the Christians, but that they paid no kind of worship to it, because it is not lawful for Christians to worship brass or any other matter. The primitive Christians abstained from the worship of images, not, as the Papilts pretend, from tendernels to heathen idolaters, but because they thought it unlawful in itself to make any images of the Deity. Justin Mart. Apol. ii. p. 44. Clem. Alex. Strom. 5. Strom. 1. and Protr. p. 46. Aug. de Civit. Dei. lib. vii. c. 5. and lib. iv. c. 32. Id. de Fide et Symb. c. 7. Lactant. lib. ii. c. 3. Tertull. Apol. c. 12. Arnob. lib. vi. p. 202. Some of the fathers, as Tertullian, Clemens Alexandrinus, and Origen, were of opinion, that, engraving were rendered unlawful to a Christian, styling them evil and wicked arts. Tert, de Idol. cap. 3. Clem. Alex. Admon. ad Gent. p. 41. Orig. contra Celfum libs vi. p. 182. The use of images in churches as ornaments, was first introduced by some Christians in Spain, in the beginning of the fourth century; but the practice was condemned as a dangerous innovation, in a council held at Eliberis in 305. Epiphanius, in a letter preferved by Jerom, tom. ii. ep. 6. bears ftrong teffimony against images, and may be considered as one of the first ICONOCLASTS. The custom of admitting pictures of faints and martyrs into the churches (for this was the first source of image worship) was rare in the latter end of the fourth century; but became common in the fifth: however, they were still confidered only as ornaments; and even in this view, they met with very confiderable opposition. In the following century the cultom of thus adorning churches became almost universal, both in the east and west. Petavius expressly fays, (de Incar. lib. xv. cap. 14.) that no flatues were yet allowed in the churches; because they bore too near a refemblance to the idols of the Gentiles. Towards the close of the fourth or beginning of the fifth century, images, which were introduced by way of ornament, and then used as an aid to devotion, began to be actually worshipped. However, it continued to be the doctrine of the church in the fixth and in the beginning of the feventh century, that images were to be used only as helps to devotion, and not as objects of worship. The worship of them was condemned in the strongest terms by Pope Gregory the Great; as appears by two letters of his written in 601. From this time to the beginning of the eighth century, there occurs no fingle instance of any worship given or allowed to be given to images by any council or affembly of bishops whatever. But they were commonly worshipped by the monks and populace in the beginning of the eighth century; infomuch, that in the year 726, when Leo published his famous edict, it had already fpread into all the provinces subject to the empire. The Lutherans condemn the Calvinifts for break-

ing the images in the churches of the Catholics, look. ing on it as a kind of facrilege; and yet they condemn the Romanids (who are professed image-worshippers) as idolaters: nor can thefe last keep pace with the Greeks, who go far beyond them in this point; which has occasioned abundance of disputes among thems

See ICONOCLASTS.

The Mahometans have a perfect aversion to images . .

which was what led them to deflroy most of the beautiful monuments of antiquity, both facted and profane, at Constantinople.

IMAGE, in Rhetoric, also fignifies a lively description

of any thing in a discourse.

Images in discourse are defined by Longinus, to be, in general, any thoughts proper to produce expressions, and which present a kind of picture to the mind.

But, in the more limited lenfe, he fays, images are fuch difcourfes as come from us, when, by a kind of enthuliafm, or an extraordinary emotion of the foul, we feem to fee the things whereof we speak, and present them before the eves of those who hear us.

Images, in rhetoric, have a very different use from what they have among the poets: the end principally proposed in poetry is, assonithment and surprize; whereas the thing chiefly aimed at in profe, is to paint thines naturally, and to show them clearly. They

have this, however, in common, that they both tend to move, each in its kind.

Thele images, or pillurer, are of valt ute, to give weight, magnificence, and firength, to a difcourfe. They warm and animate it; and, when managed with art, according to Longinus, feem, as it were, to tame and fubdue the hearer, and out him in the power of the

fneaker

Images, in Optics, a figure in the form of lany objects, made by the rays of light iffuing from the feveral points of its, and meeting in fo many other points, either at the bottom of the eye, or on any other ground, or on any transparent medium, where there is no furface to reflect them. Thus we are faid to fee all objects by means of their images formed in the eye.

IMAGINATION, a power or faculty of the mind, whereby it conceives and forms ideas of things communicated to it by the outward organs of sense.

See METAPHYSICS.

Force of IMAGINATION. See MONSTER.

IMAGO, in Natural History, is a name given by Linnaus to the third state of insects, when they appear in their proper shape and colours, and undergo no

more transformation.

IMAM, or IMAM, a minifler in the Mahometan church, answering to a parish priest among us. The word properly fignifies what we call a prelate, antistance who presides over others; but the Mussumen the presides over others that the Mussumen frequently apply it to a person who has the care and intendancy of a mosque, who is always there at first, and reads prayers to the people, which they repeat after him.

Imam is also applied, by way of excellence, to the four chiefs or founders of the four principal fects in the Mahometan religion. Thus Ali is the imam of the Persian, or of the sect of the Schiaites; Abu-beker the imam of the Sunnites, which is the fect followed by the Turks; Saphii, or Sasi-y, the imam of another

fect. &cc.

The Mahometans do not agree among themselves, about this immate or dignity of the imm. Some think it of divine right, and attached to a fingle family, as the pontificate of Aaron.—Others hold, that it is indeed of divine right, but deny it to be foat-tached to any fingle family, as that it may not be transferred to another. They add, that the imam is to be clear of all gross fins; and that otherwise he

may be depofed, and his dignity may be conferred on another. However this be, it is certain, that after an imam has once been owned as fuch by the Mufullumen, he who denies that his authority comes immediately from God is accounted impious; he who does not obey him is a rebel; and he who pretends to contradict what he flays is effected a fool, among the orthodox of that religion. The Imams have no outward mark of diffinction; their habit is the fame with that of the Turks in common, except that the turban is a

little larger, and folded fomewhat differently.

IMA US, (anc. geog.), the largeft mountain of Afia, (Strabo); and a part of Taurus, (Pliny); from
which the whole of India runs off into a vaft plain, refembling Egypt. It extends far and wide through
Scythia, as far as to the Marc Glaciale, dividing it
into the Hither or Scythia intra Imaum, and into the
Farther or Scythia intra Imaum, (Ptolemy); and alfo firetching out along the north of India to the
eaftern ocean, feparates it from Scythia. It had various names according to the different countries it run
through: Poltellus thinks it is the Sphar of Scripthrough: Poltellus thinks it is the Sphar of Scrip-

IMBECILITY, a languid, infirm flate of body, which, being greatly impaired, is not able to perform

its usual exercises and functions.

IMBIBING, the action of a dry porous body, that abforbs or takes up a moilt or fluid one: thus, fugar imbibes water; a fpunge, the moilture of the air, &c.

IMBRICATED, is used by some botanists, to express the figure of the leaves of some plants, which are hollowed like an imbrex, or gutter-tile, or are laid in close series over one another like the tiles of an house.

IMERETIA, or IMMERETTA, the name of a kingdom, or rather principality, of Georgia, confifting of four provinces, is under the dominion of a prince named David. See GEORGIA.

The capital, where prince David refides, is called Curtays. The remains of a church announce that Curtays was formerly a large city; but at prefent it can

fcarcely be accounted a village.

Solomon, the father of the prefent fovereign, ordered the citadel to be deftroyed as well as the ramparts of the city; for he thought, and very wifely, that Caucasus was the only fortification capable of being defended by an army of 6000 men undisciplined and destitute of artillery.

The number of the inhabitants of Imeretta is reckoned to be 20,000 families; but the greater part of them live neither in towns nor villages, but are differed throughout the level country, each of them possessing a final hut or cottage. These people have fewer strangers among them, and they are more engaging in their appearance, than the Georgians. They are of a milder and lels pusililanimous character; and the principal branch of their commerce consists in wines, a considerable quantity of which they export in skins as far as the consines of Georgia. They are acquainted with no other trade; for they are poor and miserable, and greatly opperfied by their lords.

The ordinary revenues of Imeretta, like those of Georgia, arise from a tythe which vasilals are obliged to pay in wines, cattle, and corn, and some subsidies furnished annually by neighbouring princes. The ex-

Imeretia, traordinary revenues for the most part arise from con-Imitation fiscations of every kind; but notwithstanding this, the finances of the prince are fo limited, that he is often under the necessity of going from house to house, to live at the expence of his vaffals, never quitting their habitations until the preffing wants of his hofts absolutely compel him. It is therefore probable, that the court of the fovereign of Imeretta is as deficient in brilliancy as his table is in fplendor when he dines at home. His principal diffies confift of a certain food called gom, which is a kind of millet boiled, and a piece of roaft meat, with fome high-feafoned fauce. He never eats but with his fingers, for forks and spoons are unknown in Imeretta. At table he generally gives audiences respecting affairs of the first consequence, which he determines as he thinks proper; for in every country subject to his dominions there is no other law

> On Friday, which is the market-day, all his new edicts are published by a kind of herald, who climbs up into fome tree, in order to proclaim the will of his fovereign. The Imerettans profess the religion of the Greek church. Their patriarch must be of the royal family; but it is feldom that he can either read or write: the priests who compose the rest of the clergy are not much more enlightened. The greater part of their churches are pitiful edifices, which can fearcely be diffinguished from the common huts of the inhabitants but by a pasteboard crucifix, and a few coarse paintings of the Virgin, which are feen in them.

> IMITATION, derived from the Latin imitare, to " reprefent or repeat," a found or action, either exactly or nearly in the fame manner as they were originally

exhibited.

but his will.

IMITATION, in music, admits of two different senses. Sound and motion are either capable of imitating themfelves by a repetition of their own particular modes; or of imitating other objects of a nobler and more abftracted nature. Nothing perhaps is fo purely mental, nothing fo remote from external fenfe, as not to be imitable by music. But as the description of this in M. Rouffeau, article Imitation, is nobly animated, and comprehends all that is neseffary to be faid on the

fubject, we translate it as follows.

"Dramatic or theatrical mufic (favs he) contributes to imitation no less than painting or poetry: it is in this common principle that we must investigate both the origin and the final cause of all the fine arts: + See Beaux as M. le Batteaux has shown +. But this imitation is not equally extensive in all the imitative arts. Whatever the imagination can represent to itself is in the department of poetry. Painting, which does not prefent its pictures to the imagination immediately, but to external fense and to one fense alone, paints only fuch objects as are discoverable by fight. Music might appear subjected to the same limits with respect to the ear; yet it is capable of painting every thing, even fuch images as are objects of ocular perception alone: by a magic almost inconceivable, it feems to transform the ears into eyes, and endow them with the double function of perceiving visible objects by the mediums of their own; and it is the greatest miracle of an art, which can only act by motion, that it can make that very motion represent absolute quiescence. Night,

fleep, filence, folitude, are the noble efforts, the grand Imitation. images, represented by a picturesque music. We know that noise can produce the same effect with silence. and filence the fame effect with noise; as when one fleeps at a lecture infipidly and monotonically delivered, but wakes the instant when it ends. But music acts more intimately upon our spirits, in exciting by one fenfe dispositions similar to those which we find excited by another: and, as the relation between these images cannot be sensible unless the impression be strong, painting, when divested of this energy, cannot reflore to mufic that affiftance in imitations which she borrows from it. Though all nature should be asleep, he who contemplates her does not fleep; and the art of the musician consists in substituting, for this image of infensibility in the object, those emotions which its presence excites in the heart of the contemplator. He not only ferments and agitates the ocean, animates the flame to conflagration, makes the fountain murmur in his harmony, calls the rattling shower from heaven, and swells the torrent to reliftless rage; but he paints the horrors of a boundless and frightful defart, involves the fubterraneous dungeon in tenfold gloom, foothes the tempest, tranquillizes the disturbed elements, and from the orchestra diffuses a recent fragrance through imaginary groves; nay, he excites in the foul the fame emotions which we feel from the immediate perception and full influence of thefe objects."

Under the word Harmony, Rouffeau has faid, that no. affiftance can be drawn from thence, no original principle which leads to mufical imitation; fince there cannot be any relation between chords and the objects which the compofer would paint, or the passions which he would express. In the article Melody, he imagines he has discovered that principle of imitation which harmony cannot yield, and what refources of nature are employed by music in representing these objects

and these passions.

It is hoped, however, that in our article of MELODY. we have shown upon what principle musical imitation may be compatible with harmony; though we admit, that from melody it derives its most powerful energy, and its most attractive graces. Yet we must either be deceived beyond all poffibility of cure, or we have felt the power of imitative harmony in a high degree. We are certain that the fury, the impetuofity, the rapid viciflitudes, of a battle, may be fuccefsfully and vividly represented in harmony. We have participated the exultation and triumph of a conquest, inspired by the found of a full chorus. We have felt all the folemnity and grandeur of devotion from the flow movement, the deep chords, the fwelling harmony, of a fentimental composition played upon the organ. Nor do we in-agine harmony less capable of presenting the tender depression, the sluctuating and tremulous agitation, of grief. As this kind of imitation is the noblest effort. of music, it is astonishing that it should have been overlooked by M. D'Alembert. He has indeed apologized, by informing us, that his treatife is merely elementary: but we are uncertain how far this apology ought to be regarded as fufficient, when it is at the fame time confidered, that he has given an account of imitation in its mechanical, or what Rouffeau calls its

Arts reduits à une meme or incipe.

Impafta.

Immer.

Imitation technical, sense; which, however, to prevent ambiguity, we should rather choose to call mymesis, or anacephaliofis. To Rouffeau's account of the word in this

acceptation, we return.

"Imitation (fays he), in its technical fenfe, is a reiteration of the fame air, or of one which is fimilar, in feveral parts where it is repeated by one after the other, either in unifon, or at the diffance of a fourth, a fifth, a third, or any other interval whatever. The imitation may be happily enough purfued even though feveral notes should be changed; provided the same air may always be recognifed, and that the composer does not deviate from the laws of proper modulation. Frequently, in order to render the imitation more fenfible, it is preceded by a general reft, or by long notes which feem to obliterate the impression formerly made by the air till it is renewed with greater force and vivacity by the commencement of the imitation. The imitation may be treated as the composer chooses; it may be abandoned, refumed, or another begun, at pleafure; in a word, its rules are as much relaxed as those of the fugue are fevere: for this reason, it is despised by the most eminent masters; and every imitation of this kind too much affected, almost always betrays a novice rin composition."

IMITATION, in oratory, is an endeavour to refemble a speaker or writer in those qualities with regard to which we propose them to ourselves as patterns. The first historians among the Romans, fays Cicero, were wery dry and jejune, till they began to imitate the Greeks, and then they became their rivals. It is well known how closely Virgil has imitated Homer in his Æneid, Hefiod in his Georgics, and Theocritus in his Eclogues. Terance copied after Menander; and Plautus after Epicarmus, as we learn from Horace, lib. ii. ep. ad August, who himself owes many of his beauties to the Greek lyric poets. Cicero appears, from many passages in his writings, to have imitated the Greek orators. Thus Quintilian fays of him, that he has expressed the strength and sublimity of Demosthenes, the copiousness of Plato, and the delicacy

IMMACULATE, fomething without flain, chiefly applied to the conception of the holy Virgin. See

CONCEPTION Immaculate.

IMMATERIAL, fomething devoid of matter, or

that is pure fpirit. See METAPHYSICS.

IMMEDIATE, whatever is capable of producing an effect without the intervention of external means; thus we fay, an immediate cause, in opposition to a mediate or remote one.

IMMEMOR AL, an epithet given to the time or duration of any thing whose beginning we know no-

In a legal fense, a thing is said to be of time immemorial, or time out of mind, that was before the reign of our king Edward II.

IMMENSITY, an unlimited extension, or which no finite and determinate space, repeated ever so often,

IMMER, the most easterly island of all the New Hebrides in the South Sea It lies about four leagues from TANNA, and feems to be about five leagues in circumference; it is of a confiderable height, with a flattcp. No 164.

IMMERETTA, or IMERETIA. See IMERETIA. Immeretta IMMERSION, that act by which any thing is plun-

ged into water or other fluid.

It is used in chemistry for a species of calcination, when any body is immerfed in a fluid to be corroded: or it is a species of lotion; as when a substance is plunged into any fluid, in order to deprive it of a bad qua-

lity, or communicate to it a good one. IMMERSION, in aftronomy, is when a ftar or planet is fo near the fun with regard to our observations, that we cannot fee it; being, as it were, inveloped and hid in the rays of that luminary. It also denotes the beginning of an eclipse of the moon, or that moment

when the moon begins to be darkened, and to enter into the shadow of the earth.

IMMOLATION, a ceremony used in the Roman facrifices; it confifted in throwing upon the head of the victim fome fort of corn and frankincenfe, together with the mola or falt cake, and a little wine.

IMMORTAL, that which will last to all eternity, as having in it no principle of alteration or corruption.

IMMUNITY, a privilege or exemption from fome office, duty, or imposition, as an exemption from tolls.

Immunity & more particularly understood of the liberties granted to cities and communities.

IMMUTABILITY, the condition of a thing that

cannot change. Immutability is one of the divine attributes. See Gon.

IMOL A, a town of Italy, in the territory of the church, and in Romagna, with a bishop's fee. It is a very handsome populous place; and is feated on the river Santerno, in E. Long. 11. 43. N. Lat. 44.

IMPALE, in heraldry, is to comioin two coats of arms pale wife. Women impale their coats of arms with those of their husbands. See HERALDRY.

To impale cities, camps, fortifications, &c. is to inclose them with pallisadoes.

To IMPALE, or Empale, fignifies also to put to death by spitting on a stake fixed upright.

IMPALPABLE, that whose parts are so extremely minute, that they cannot be diffinguished by the fenfes,

particularly by that of feeling.

IMPANATION, a term used by divines to fignify the opinion of the Lutherans with regard to the eucharift, who believe that the species of bread and wine remain together with the body of our Saviour after con-

IMPANNELLING, in law, fignifies the writing down or entering into a parchment, lift, or schedule, the names of a jury fummoned by the sheriff to appear for fuch public fervices as juries are employed in.

IMPARLANCE, in law, a petition in court for a day to confider or advise what answer the defendant shall make to the plaintiff's action; and is the continuance of the cause till another day, or a longer time given by the court.

IMPASSIBLE, that which is exempt from fuffering; or which cannot undergo pain, or alteration. The Stoics place the foul of their wife man in an impaffible,

imperturbable state. See APATHY.

IMPASTATION, the mixtion of various materials of different colours and confiftencies, baked or bound 2

Impatiens together with some cement, and hardened either by the called impeccance than impeccability; accordingly divines Impedi-Impeccabi- air or by fire.

lity.

IMPATIENS, TOUCH-ME-NOT, and Balfamine: A genus of the monogamia order, belonging to the fyugenefia class of plants; and in the natural method ranking under the 24th order, Corydales. The calyx is diphyllous; the corolla pentapetalous, and irregular, with an hooded nectarium; the capfule superior and quinquevalved.

Species. 1. The noli-me-tangere, or common yellow balfamine, is a native of Britain, but is cultivated in many gardens for curiofity. It hath a fibrous root, an upright, jointed, fucculent, stalk, about 18 inches high, with alternate oval leaves; and, from the axillas of the stalks, long, flender, branching footstalks, each fultaining many yellow flowers; fucceeded by taper capfules, that burft open and dart forth their feeds with great velocity, whence its name. 2. The balfamina, or balfam, is a native of India. It hath a fibrous root, an upright, thick, fucculent stalk, branching all around a foot and an half or two feet high; with long, spear shaped, sawed leaves, the upper ones alternate; and from the joints of the stalk and branches clusters of short foot-stalks, each sustaining one large irregular flower, of different colours in the varieties: flowering from June or July till September.

Culture. The first species is very hardy, and will grow freely from the feeds in any common border; but the fecond requires artificial warmth. The feeds will indeed grow in the full ground, but rarely before the month of May; and more freely then, if covered with a hand-glass, &c. But the plants raised by artificial heat will flower five or fix weeks fooner than those raised in the natural ground. The seeds ought therefore always to be fowed on a hot-bed in March or April, and the plants continued therein till June; and if the frames be deep, they will then be drawn up to the length of two or three feet; after which they may be planted in pots, which must likewise be continued in the hot-bed till the plants have taken fresh root.

IMPEACHMENT, an accufation and profecution for treason and other crimes and misdemeanors. Any member of the lower house of parliament may impeach any one belonging either to that body or to the house of lords. The method of proceeding is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. These articles are carried to the lords, by whom every perfon impeached by the commons is always tried; and if they find him guilty, no pardon under the great feal can be pleaded to fuch an impeachment, 12 Will, III,

IMPECCABILES, in church history, a name given to those heretics who boasted that they were impeccable, and that there was no need of repentance : fuch were the Gnoftics, Priscillianists, &c.

IMPECCABILITY, the flate of a person who cannot fin: or a grace, privilege, or principle, which puts him out of a possibility of finning.

The schoolmen diftinguish several kinds and degrees of impeccability: that of God belongs to him by nature: that of Jesus Christ, considered as man, belongs to him by the hypoftatical union: that of the bleffed is a consequence of their condition: that of men is the effect of a confirmation in grace, and is rather Vol. IX. Part I.

diftinguish between these two: this distinction is found necessary in the disputes against the Pelagians, in or- Imperfect, der to explain certain terms in the Greek and Latin . fathers, which without this diffinction are eafily con-

founded. IMPEDIMENTS, in law, are fuch hindrances as put a stop or stay to a person's seeking for his right by a due course of law. Persons under impediments are those under age or coverture, non compos mentis, in prison, beyond sea, &c. who, by a faving in our laws, have time to claim and profecute their rights, after the impediments are removed, in case of fines levied. &c.

IMPENETRABILITY, in philosophy, that property of body, whereby it cannot be pierced by another: thus, a body which fo fills a space as to exclude all others, is faid to be impenetrable.

IMPERATIVE, one of the moods of a verb, used when we would command, intreat, or advise: thus, go read, take pity, be advised, are imperatives in our language. But in the learned languages, this mood has a peculiar termination to diftinguish it from others, as i, or ito, " go ;" lege, or legito, " read," &c. and not only fo, but the termination varies, according as you address one or more persons, as audi and audite; анніть, акнітьк, акнітьках, &С.

IMPERATOR, in Roman antiquity, a title of honour conferred on victorious generals by their armies, and afterwards confirmed by the fenate.

Imperator was also the title adopted by the Roman emperors.

IMPERATORIA, MASTERWORT: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, Umbellata. The fruit is roundish, compreffed in the middle, gibbous, and furrounded with a border; the petals are inflexo-emarginated. There is but one species, viz. the offruthium, a native of the Austrian and Styrian Alps, and other mountainous places of Italy. Mr Lightfoot informs us, that he has found it in feveral places on the banks of the Clyde in Scotland; but whether indigenous or not, is uncertain. The root is as thick as a man's thumb, running obliquely in the ground; it is fleshy, aromatic, and has a ftrong acrid tafte, biting the tongue like pellitory of Spain: the leaves arise immediately from the root: they have long foot-stalks, dividing into three very short ones at the top, each fultaining a trilobate leaf, indented on the border. The footftalks are deeply channeled, and, when broken, emit a rank odour. flower stalks rife about two feet high, dividing into two or three branches, each being terminated by a pretty large umbel of white flowers whose petals are fplit; these are succeeded by oval compressed seeds, fomewhat like those of dill, but larger .- The plant is cultivated in gardens for the fake of its roots, which are used in medicine. It may be propagated either by feeds, or by parting the roots in autumn. They thrive best in a shady situation. - The root has a flavour fimilar to that of angelica, and is esteemed a good fudorific. There are inflances of its having cured the ague when the bark had failed. It should be dug up in winter, and a strong infusion made in wine.

IMPERFECT, fomething that is defective, or that

Impossible.

the fame kind.

IMPERFECT Tenfe, in grammar, a tenfe that denotes

fome preterite case, or denotes the thing to be at that time prefent, and not quite finished; as seribebam, " I was writing." See GRAMMAR.

IMPERIAL, fomething belonging to an emperor, or empire. See EMPEROR and EMPIRE .- Thus we fay, his imperial majefty, the imperial crown, imperial arms. &c.

IMPERIAL Crown. See HERALDRY, p. 462.

IMPERIAL Chamber, is a fovereign court, established for the affairs of the immediate flates of the empire. See CHAMBER, and GERMANY.

IMPERIAL Cities, in Germany, are those which own

no other head but the emperor.

These are a kind of little commonwealths; the chief magistrate whereof does homage to the emperor, but in other respects, and in the administration of justice,

is fovereign.

Imperial cities have a right of coining money, and of keeping forces and fortified places. Their deputies affift at the imperial diets, where they are divided into two branches, that of the Rhine and that of Suabia. There were formerly 22 in the former and 37 in the latter; but there are now only 48 in all.

IMPERIAL Diet, is an affembly or convention of all the states of the empire. See DIET and GERMANY.

IMPERIALI (John Baptist), a celebrated phyfician of Vicenza, where he was born in 1568. He composed several esteemed works both in prose and verse, written in good Latin; and died in 1623.

IMPERSONAL VERB, in grammar, a verb to which the nominative of any certain person cannot be prefixed; or, as others define it, a verb destitute of the two first and primary persons, as decet, oportet, &c. The impersonal verbs of the active voice end in t, and those of the passive in tur; they are conjugated thro' the third person singular of almost all the tenses and moods: they want the imperative, inflead of which we use the present of the subjunctive; as paniteat, pugnetur, &c. nor, but a few excepted, are they to be met with in the fupines, participles, or gerunds.

IMPERVIOUS, a thing not to be pervaded or passed through, either by reason of the closeness of its pores, or the particular configuration of its parts.

IMPETIGO, in Medicine, an extreme roughness and foulness of the skin, attended with an itching and

plentiful fcurf.

The impeligo is a species of dry pruriginous itch, wherein scales or scurf succeed apace; arising from faline corrofive humours thrown out upon the exterior parts of the body, by which means the internal parts are usually relieved

IMPETRATION, the act of obtaining any thing

by request or prayer.

IMPETRATION was more particularly used in our flatutes for the pre-obtaining of benefices and churchoffices in England from the court of Rome, which did belong to the disposal of the king and other lay patrons of the realm; the penalty whereof is the fame with that of provifors, 25 E. III.

IMPETUS, in mechanics, the force with which

one body firikes or impels another.

IMPLICATION, in law, is where fomething is moral.

in their deeds, contracts, or agreements.

To IMPLY, or CARRY, in Music. These we have used as fynonymous terms in that article. They are intended to fignify those founds which ought to be the proper concomitants of any note, whether by its own nature, or by its position in artificial harmony. Thus every note, confidered as an independent found, may be faid to carry or imply its natural harmonics, that is to fay, its octave, its twelfth, and its feventeenth; or, when reduced, its eighth, its fifth, and its third. But the fame found, when confidered as constituting any part of harmony, is subjected to other laws and different limitations. It can then only be faid to carry or imply fuch fimple founds, or complications of found, as the preceding and fublequent chords admit or require. For these the laws of melody and harmony must be consulted. See MELODY and HAR-

IMPORTATION, in commerce, the bringing merchandise into a kingdom from foreign countries: in contradiffinction to exportation. See Exporta-

For the principal laws relating to importation, fee

Custom-house LAWS.

IMPOSITION of hands, an ecclefiaftical action by which a bishop lays his hand on the head of a person, in ordination, confirmation, or in uttering a bleffing. This practice is also frequently observed by the diffenters at the ordination of their ministers, when all the ministers prefent place their hands on the head of him whom they are ordaining, while one of them prays for a bleffing on him and his future labours. This fome of them retain as an ancient practice, juffified by the example of the apostles, when no extraordinary gifts are conveyed. However, they are not agreed as to the propriety of this ceremony; nor do they confider it as an effential part of ordination.

Imposition of hands was a Jewish ceremony, introduced not by any divine authority, but by custom; it being the practice among those people whenever they prayed to God for any perfon to lay their hands on

his head.

Our Saviour observed the fame custom, both when he conferred his bleffing on children and when he cured the fick; adding prayer to the ceremony. The apostles likewise laid hands on those upon whom they bestowed the Holy Ghost .- The priests observed the fame custom when any one was received into their body .- And the apostles themselves underwent the imposition of hands afresh every time they entered upon any new defign. In the ancient church impofition of hands was even practifed on persons when they married, which cultom the Abyffinians still obferve.

IMPOSSIBLE, that which is not possible, or which cannot be done or effected. A proposition is said to be impossible, when it contains two ideas which mutually destroy each other, and which can neither be conceived nor united together. Thus it is impossible that a circle should be a square; because we conceive clearly that fquareness and roundness destroy each other by the contrariety of their figure.

There are two kinds of impossibilities, physical and

Imporercy.

Phyfical impossibility is that which is contrary to the law of nature.

A thing is morally impossible, when of its own nature it is possible, but yet is attended with such difficulties, as that, all things confidered, it appears impossible. Thus it is morally impossible that all men should be virtuous; or that a man should throw the fame number with three dice a hundred times fucceffively.

A thing which is impossible in law, is the same with a thing impossible in nature: and if any thing in a bond or deed be impossible to be done, such deed,

&c. is void. 21 Car. I.

IMPOST, in law, fignifies in general a tribute or custom, but is more particularly applied to fignify that tax which the crown receives for merchandifes im-

ported into any port or haven.

IMPOSTHUME, or abfcefs, a collection of matter or pus in any part of the body, either owing to an obstruction of the fluids in that part which makes them change into such matter, or to a translation of it from fome other part where its was generated. See

IMPOSTOR, in a general fense, denotes a person

who cheats by a fictitious character.

Religious Impostors, are fuch as falfely pretend to an extraordinary commission from heaven; and who terrify and abuse the people with false denunciations of judgments. These are punishable in the temporal courts with fine, imprisonment, and infamous corporal punishment

IMPOTENCE, or IMPOTENCY, in general, denotes want of strength, power, or means, to perform

any thing.

Divines and philosophers diftinguish two forts of impotency; natural and moral. The first is a want of fome physical principle, necessary to an action; or where a being is absolutely defective, or not free and at liberty to act : The fecond only imports a great difficulty; as a strong habit to the contrary, a violent

paffion, or the like.

IMPOTENCY is a term more particularly used for a natural inability to coition. Impotence with respect to men is the same as sterility in women; that is, an inability of propagating the species. There are many causes of impotence; as, a natural defect in the organs of generation, which feldom admits of a cure: accidents or difeases; and in such cases the impotence may or may not be remedied, according as these are curable or otherwife .-- The most common causes are, early and immoderate venery, or the venereal difeafe. We have instances, however, of unfitness for generation in men by an impediment to the ejection of the femen in coition, from a wrong direction which the orifice at the verumontanum got, whereby the feed was thrown up into the bladder. M. Petit cured one patient under fuch a difficulty of emission, by making an incision like to that commonly made in the great operation for

On this fubject we have fome curious and original observations by the late Mr John Hunter in his Trea-tise on the Venereal Disease*. He considers impo-certainly shall not shed tears, or at least not so freely &c. ad edit. tency as depending upon two causes. One he refers as would have happened from our natural feelings. to the mind; the other to the organs.

1. As to impotency depending upon the mind, he observes, impotency. that as the "parts of generation are not necessary for the existence or support of the individual, but have a reference to something else in which the mind has a principal concern; fo a complete action in those parts cannot take place without a perfect harmony of body and of mind : that is, there must be both a power of body and disposition of mind; for the mind is subject to a thousand caprices, which affect the actions of these

" Copulation is an act of the body, the spring of which is in the mind; but it is not volition; and according to the state of the mind, so is the act performed. To perform this act well, the body should be in health, and the mind should be perfectly confident of the powers of the body : the mind should be in a state entirely disengaged from every thing else: it should have no difficulties, no fears, no apprehenfions, not even an anxiety to perform the act well; for even this anxiety is a state of mind different from what should prevail; there should not be even a fear that the mind itself may find a difficulty at the time the act should be performed. Perhaps no function of the machine depends fo much upon the state of the mind as this.

"The will and reasoning faculty have nothing to do with this power; they are only employed in the act, fo far as voluntary parts are made use of: and if they ever interfere, which they fometimes do, it often produces another state of mind which destroys that which is proper for the performance of the act : it produces a defire, a wish, a hope, which are all only diffidence and uncertainty, and create in the mind the idea of a possibility of the want of success, which de-Broys the proper state of mind or necessary confidence.

"There is perhaps no act in which a man feels himself more interested, or is more anxious to perform well; his pride being engaged in some degree, which if within certain bounds would produce a degree of perfection in an act depending upon the will, or an act in voluntary parts; but when it produces a flate of mind contrary to that state on which the perfection of the act depends, a failure must be the consequence.

"The body is not only rendered incapable of performing this act by the mind being under the above influence, but also by the mind being, tho' perfectly confident of its power, yet conscious of an impropriety in performing it; this, in many cases, produces a state of mind which shall take away all power. The state of a man's mind respecting his fifter takes away all power. A conscientious man has been known to lose his powers on finding the woman he was going to be connected with unexpectedly a virgin.

" Shedding tears arises entirely from the state of the mind, although not fo much a compound action as the act in question; for none are fo weak in body that they cannot flied tears: it is not fo much a compound action of the mind and ftrength of body joined, as the other act is; yet if we are afraid of shedding tears, or are defirous of doing it, and that anxiety is

4 From this account of the necessity of having the

Ampotency, mind independent respecting the act, we must see that though all tending to produce one ultimate effect. In Impotency, it may very often happen that the flate of mind will all fuch organs when perfect (he observes), there is a be fuch as not to allow the animal to exert its na- fuccession of motions, one naturally arising out of the tural powers; and every failure increases the evil. We other, which in the end produces the ultimate effect: must also see from this state of the case, that this act must be often interrupted; and the true cause of this interruption not being known, it will be laid to the charge of the body or want of powers. As these cases do not arise from real inability, they are to be carefully diffinguished from fuch as do; and perhaps the only way to diffinguish them is, to examine into the state of mind respecting this act. So trifling often is the circumstance which shall produce this inability depending on the mind, that the very defire to pleafe thall have that effect, as in making the woman the fole object to be gratified.

" Cases of this kind we see every day; one of which I shall relate as an illustration of this fubiect, and also of the method of cure .- A gentleman told me, that he had loft his virility. After above an hour's investigation of the case. I made out the following facts: that he had at unnecessary times strong erections, which showed that he had naturally this power; that the erections were accompanied with defire, which are all the natural powers wanted; but that there was ftill a defect fomewhere, which I fupposed to be from the mind. I inquired if all women were alike to him? his aufwer was. No: fome women he could have connection with as well as ever. This brought the defect, whatever it was, into a smaller compass: and it appeared there was but one woman that produced this inability, and that it arose from a defire to perform the act with this woman well; which defire produced in the mind a doubt or fear of the want of fuccess, which was the caufe of the inability of performing the act. As this arose entirely from the flate of the mind produced by a particular circumstance, the mind was to be applied to for the cure; and I told him that he might be gured, if he could perfectly rely on his own power of felf-denial. When I explained what I meant, he told me that he could depend upon every act of his will or refolution. I then told him, that, if he had a perfect confidence in himself in that respect, he was to go to bed to this woman, but first promise to himself that he would not have any connection with her for fix nights, let his inclinations and powers be what they would; which he engaged to do, and also to let me know the refult. About a fortnight after, he told me, that this resolution had produced such a total alteration in the state of his mind, that the power foon took place; for instead of going to bed with the fear of inability, he went with fears that he should be posfelled with too much defire, too much power, fo as to become uneafy to him: which really happened; for he would have been happy to have shortened the time; and when he had once broke the spell; the mind and powers went on together, and his mind never returned to its former state."

2. Of impotency from a want of proper correspondence between the actions of the different organs. Our author, in a former part of his Treatife, when confidering the difeases of the urethra and bladder, had remarked, that every organ in an animal body, without exception, was made up of different parts, whose functions or actions were totally different from one another, al-

and an irregularity alone in these actions will contitute difeafe, at least will produce very difagreeable effects. and often totally frustrate the intention of the organ. This principle Mr Hunter, on the present occasion. applies to the " actions of the tefficles and penis; for we find that an irregularity in the actions of thefe parts fometimes happen in men, producing impotence; and fomething fimilar probably may be one cause of barrenness in women.

" In men, the parts fubfervient to generation may be divided into two; the effential, and the accessory. The testicles are the effential; the penis, &c. the accessory. As this division arises from their uses or actions in health, which exactly correspond with one another, a want of exactness in the correspondence or susceptibility of those actions may also be divided into two: where the actions are reverfed, the acceffory taking place without the first or effential, as in erections of the penis, where neither the mind nor the tellicles are ftimulated to action; and the second is where the testicles performs the action of tecretion too readily for the penis, which has not a corresponding erection. The first is called priapi/m; and the second is what ought to be called feminal weakness.

"The mind has confiderable effect on the correspondence of the actions of these two parts; but it would appear in many inflances, that erections of the penis depend more on the state of the mind than the fecretion of the femen does; for many have the fecretion, but not the erection; but in fuch, the want of erection appears to be owing to the mind only.

" Priapifm often arifes spontaneously; and often from visible irritation of the penis, as in the venereal gonorrhœa, especially when violent. The sensation of fuch erections is rather uneafy than pleafant; nor is the fenfation of the glans at the time fimilar to that arifing from the erections of defire, but more like to the fenfation of the parts immediately after coition. Such as arife fpontaneously are of more serious consequence than those from inflammation, as they proceed probably from causes not curable in themselves or by any known methods. The priapifm arifing from inflammation of the parts, as in a gonorrhea, is attendtended with nearly the fame fymptoms; but generally the fensation is that of pain, proceeding from the inflammation of the parts. It may be observed, that what is faid of priapifm is only applicable to it when a difease in itself, and not when a symptom of other difeases, which is frequently the case.

"The common practice in the cure of this complaint is to order all the nervous and ftrengthening medicines; fuch as bark, valerian, musk, camphor, and aifo the cold bath. I have feen good effects from the cold bath; but fometimes it does not agree with the constitution, in which case I have found the warm bath of fervice. Opium appears to be a specific in many cases; from which circumstance I should be apt, upon the whole, to try a foothing plan.

"Seminal weakness, or a secretion and emission of the femen without erections, is the reverse of a prispifm, and is by much the worlt difease of the two. There

Impotency. There is great variety in the degrees of this difeafe, often in his fleep involuntary emiffions, which generally Impotence there being all the gradations from the exact corre- awake him at the paroxyfm; but what surprises him foundence of the actions of all the parts to the tefficles most is, that often he has fuch without any femen Impregnaacting alone; in every case of the disease, there is too passing forwards through the penis, which makes him quick a fecretion and evacuation of the femen. Like to the priapifm, it does not arife from defires and abilities: although when mild it is attended with both, but not in a due proportion; a very flight defire often p oducing the full effect. The fecretion of the femen shall be so quick, that simple thought, or even toying, shall make it flow.

" Dreams have produced this evacuation repeatedly in the fame night; and even when the dreams have been fo flight, that there has been no consciousness of them when the fleep has been broken by the act of emission. I have known cases where the testicles have been fo ready to fecrete, that the least friction on the glans has produced an emission: I have known the fimple action of walking or riding produce this effect, and that repeatedly, in a very short space of time.

"A young man, about four or five and twenty years of age, not fo much given to venery as most young men, had thefe laft mentioned complaints upon him Three or four times in the night he would emit; and if he walked fait, or rode on horfeback, the fame thing would happen. He could feareely have connection with a woman before he emitted, and in the emission there was hardly any fpafm. He tried every funnofed ftrengthening medicine, as also the cold bath and feabathing, but with no effect By taking 20 drops of laudanum on going to bed, he prevented the night emissions; and by taking the same quantity in the morning, he could walk or ride without the before mentioned inconvenience. I directed this practice to be continued for fome time, although the difease did not return, that the parts might be accustomed to this healthy flate of action; and I have reason to believe the gentleman is now well. It was found neceffary, as the conflitution became more habituated to the opiate, to increase the dose of it.

"The spasms, upon the evacuation of the semen in fuch cases, are extremely slight, and a repetition of them foon takes place; the first emission not preventing a fecond; the conftitution being all the time but little affected (A). When the testicles act alone, without the accessory parts taking up the necessary and natual confequent action, it is still a more melancholy difease; for the fecretion arises from no vilible or fenfible cause, and does not give any visible or sensible effect, but runs off fimilar to involuntary flools or urine. It has been observed that the semen is more fluid than natural in fome of these cases.

"There is great variety in the diseased actions of these parts; of which the following case may be confidered as an example. A gentleman has had a stricture in the urethra for many years, for which he has frequently used a bougie, but of late has neglected it. He has had no connection with women for a confiderable time, being afraid of the confequences. He has

think that at those times it goes backwards into the bladder. This is not always the case, for at other _ times the femen passes forwards. At the time the femen feems to pass into the bladder, he has the erection, the dream; and is awaked with the same mode of action, the fame fenfation, and the fame pleafure. as when it passes through the urethra, whether dreaming or waking. My opinion is, that the fame irritation takes place in the bulb of the urethra without the femen, that takes place there when the femen enters, in confequence of all the natural preparatory steps, whereby the very same actions are excited as if it came into the paffage: from which one would suppose, that either semen is not secreted; or if it be, that a retrograde motion takes place in the actions of the acceleratores urinæ. But if the first be the case, then we may suppose, that in the natural state the actions of those muscles do not arise simply from the stimulus of the f men in the part, but from their action being a termination of a preceding one making part of a feries of actions. Thus they may depend upon the friction. or the imagination of a friction, on the penis; the telticles not doing their part, and the fpafm in fuch cafes ariting from the triction and not from the fecretion. In many of those cases of irregularity, when the erection is not ftrong, it shall go off without the emission; and at other times an emiffion shall happen almost without an erection; but these arise not from debility, but affections of the mind.

" In many of the preceding cases, washing the penis, scrotum, and perinæum, with cold water, is often of fervice; and to render it colder than we find it in some feafons of the year, common falt may be added to it. and the parts washed when the salt is almost diffolved."

IMPOTENCY is a canonical difability, to avoid marriage in the spiritual court. The marriage is not void ab initio, but voidable only by fentence of feparation during the life of the parties.

IMPRECATION, (derived from in, and precor-" I pray;") a curse or wish that some evil may befal any one.

The ancients had their goddeffes called Imprecations. in Latin Dira, i. e. Deorum ira, who were supposed to be the executioners of evil confciences. They were called Dira in heaven, Furies on earth, and Eumenides in hell. The Romans owned but three of these Imprecations, and the Greeks only two. They invoked them with prayers and pieces of verfes to deltroy their enemies.

IMPREGNATION, the getting a female with child See Conception.

The term impregnation is also used, in pharmacy, for communicating the virtues of one medicine to another, whether by mixture, coction, digettion, &c.

IM-

⁽a) " It is to be confidered, that the conflitution is commonly affected by the spasms only, and in proportion to their violence, independent of the fectorion and evacuation of the femen. But in some cates even the crection going off without the spains on the emission, shall produce the same debility as if they had taken place."

Impreffing Imprisonment

IMPRESSING STAMEN. The power of impreffing fea-faring men for the fea-fervice by the king's commission, has been a matter of some dispute, and fubmitted to with great reluctance; though it hath very clearly and learnedly been shown by Sir Michael Foster, that the practice of impressing, and granting powers to the admiralty for that purpose, is of very ancient date, and hath been uniformly continued by a regular feries of precedents to the present time : whence he concludes it to be part of the common law. The difficulty arises from hence, that no statute has expressly declared this power to be in the crown, though many of them very strongly imply it. The statute 2 Ric. II. c. 4. speaks of mariners being arrested and retained for the king's fervice, as of a thing well known, and practifed without dispute; and provides a remedy a-gainst their running away. By a later statute, if any waterman, who uses the river Thames, shall hide himfelf during the execution of any commission of pressing for the king's fervice, he is liable to heavy penalties. By another (5 Eliz. c. 5.) no fisherman shall be taken by the queen's commission to serve as a mariner; but the commission shall be first brought to two justices of the peace, inhabiting near the fea-coast where the mariners are to be taken, to the intent that the juffices may choose out and return such a number of ablebodied men, as in the commission are contained, to ferve her majesty. And by others, especially protections are allowed to feamen in particular circumstances, to prevent them from being impressed. Ferrymen are also said to be privileged from being impressed, at common law. All which do most evidently imply a power of impressing to reside somewhere; and if any where, it must, from the spirit of our constitution, as well as from the frequent mention of the king's commission, refide in the crown alone .- After all, however, this method of manning the navy is to be confidered as only defensible from public necessity, to which all private confiderations must give way.

The following persons are exempted from being impressed: Apprentices for three years; the master, mate, and carpenter, and one man for every 100 tons, of veffels employed in the coal trade; all under 18 years of age, and above 55; foreigners in merchant-ships and privateers; landmen betaking themselves to sea for two years; feamen in the Greenland fishery, and harpooners, employed, during the interval of the fishing feafon, in the coal trade, and giving fecurity to go to

the fishing next season.

IMPRESSION is applied to the species of objects which are supposed to make some mark or impression on the fenfes, the mind, and the memory. The Peripatetics affert, that bodies emit species resembling them, which are conveyed to the common fenforium, and they are rendered intelligible by the active intellect; and, when thus fpiritualized, are called expressions, or express species, as being expressed from the others.

IMPRESSION also denotes the edition of a book, regarding the mechanical part only; whereas edition, befides this, takes in the care of the editor, who corrected or augmented the copy, adding notes, &c. to

render the work more ufeful.

IMPRISONMENT, the state of a person restrained of his liberty, and detained under the custody of another.

No person is to be imprisoned but as the law directs, Imprisoneither by the command or order of a court of record, or by lawful warrant; or the king's process, on which one may be lawfully detained. And at common law, a person could not be imprisoned unless he were guilty of fome force and violence, for which his body was fubject to imprisonment, as one of the highest executions. Where the law gives power to imprison, in fuch case it is justifiable, provided he that does it in pursuance of a statute exactly pursues the statute in the manner of doing it; for otherwife it will be deemed false imprisonment, and of consequence it is unjustifiable. Every warrant of commitment for imprifoning a person, ought to run, "till delivered by due course of law," and not " until farther order;" which has been held ill; and thus it also is, where one is imprisoned on a warrant not mentioning any cause for which he is committed. See ARREST and Com-

False IMPRISONMENT. Every confinement of the person is an imprisonment, whether it be in a common prison, or in a private house, or in the stocks, or even by forcibly detaining one in the public streets. Unlawful or false imprisonment, confitts in such confinement or detention without fufficient authority : which authority may arise either from some process from the courts of justice; or from some warrant from a legal power to commit, under his hand and feal, and expressing the cause of such commitment; or from some other special cause warranted, for the necessity of the thing, either by common law or act of parliament; fuch as the arresting of a felon by a private person without warrant, the impressing of mariners for the public fervice, or the apprehending of waggoners for misbehaviour in the public highways. False imprifonment also may arise by executing a lawful warrant or process at an unlawful time, as on a Sunday; or in a place privileged from arrefls, as in the verge of the king's court. This is the injury. The remedy is of two forts; the one removing the injury, the other making fatisfaction for it.

The means of removing the actual injury of false imprisonment are four-fold, 1. By writ of MAINPRIZE. 2. By writ De Odio et Atia. 3. By writ De Homine. Replegiando. 4. By writ of HABEAS Corpus. See

those articles.

The fatisfactory remedy for this injury of false imprisonment, is by an action of trespass vi et armis, usually called an action of false imprisonment; which is generally, and almost unavoidably, accompanied with a charge of affault and battery also: and therein the party shall recover damages for the injuries he has received; and also the defendant is, as for all other injuries committed with force, or vi et armis, liable to pay a fine to the king for the violation of the public peace.

IMPROMPTU, or INPROMPTU, a Latin word frequently used among the French, and sometimes in English, to fignify a piece made off-hand, or extempore, without any previous meditation, by mere force and

vivacity of imagination.

1MPROBATION, in Scots law, the name of any action brought for fetting any deed or writing afide upon the head of forgery

IMPROPRIATION, in ecclefiaftical law. See APPROPRIATION.

Impurity

filement. Of these there were several forts. Some were Inalien ble voluntary, as the touching a dead body, or any animal that died of itself, or any creature that was esteemed unclean; or the touching things holy, by one who was not clean, or was not a prieft; the touching one who had a leprofy, one who had a gonorrhea, or who was polluted by a dead carcafe, &c. Sometimes these impurities were involuntary; as when any one inadvertently touched bones, or a fepulchre, or any thing polluted; or fell into fuch difeases as pollute, as the leprofy, &c.

The beds, clothes, and moveables, which had touched any thing unclean, contracted also a kind of impurity, and in fome cases communicated it to others.

These legal pollutions were generally removed by bathing, and latted no longer than the evening. The person polluted plunged over head in the water, and either had his clothes on when he did fo, or washed himfelf and his clothes feparately. Other pollutions continued feven days, as that which was contracted by touching a dead body. That of women in their monthly courfes lasted till this was over with them. Other impurities lasted 40 or 50 days; as that of women who were lately delivered, who were unclean 40 days after the birth of a boy, and 50 after the birth of a girl. Others again lasted till the person was cured.

Many of these pollutions were expiated by facrifices; and others by a certain water or lye made with the ashes of a red heifer, sacrificed on the great day of expiation. When the leper was cured, he went to the temple, and offered a facrifice of two birds, one of which was killed and the other fet at liberty. He who had touched a dead body, or had been prefent at a funeral, was to be purified with the water of expiation, and this upon pain of death. The woman who had been delivered, offered a turtle and a lamb for her expiation; or if the was poor, two turtles or two young pigeons.

These impurities, which the law of Moses has expressed with the greatest accuracy and care, were only figures of other more important impurities, fuch as the fins and iniquities committed against God, or faults committed against our neighbour. The faints and prophets of the Old Testament were sensible of this; and our Saviour, in the gospel, has strongly inculcated, that they are not outward and corporeal pollutions which render us unacceptable to God, but fuch inward pollutions as infect the foul, and are violations of justice,

truth, and charity

IMPUTATION, in general, the charging fome thing to the account of one which belonged to another: thus, the affertors of original fin maintain, that Adam's fin is imputed to all his posterity.

In the fame fenfe, the righteoufness and merits of

Christ are imputed to true believers. INACCESSIBLE, fomething that cannot be come at, or approached, by reason of intervening obstacles, as a river, rock, &c. It is chiefly used in speaking of heights and distances. See GEOMETRY.

INACHUS, founder of the kingdom of Argos,

1856 B. C. See ARGOS.

INALIENABLE, that which cannot be legally alienated or made over to another: thus the dominions of the king, the revenues of the church, the estates of

IMPURITY, in the law of Mofes, is any legal de- a minor, &c. are inalienable, otherwife than with a re- Inanimate ferve of the right of redemption.

INANIMATE, a body that has either loft its foul,

or that is not of a nature capable of having any.

INANITION, among phyficians, denotes the flate of the stomach when empty, in opposition to repletion.

INANITY, the school term for emptiness or abfolute vacuity, and implies the absence of all body and matter whatfoever, fo that nothing remains but

mere space.

INARCHING, in gardening, is a method of grafting, commonly called grafting by approach; and is used when the flock intended to graft on, and the tree from which the graft is to be taken, fland fo near, or can be brought fo near, that they may be joined together. The branch to be inarched is to be fitted to that part of the flock where it is to be joined; the rind and wood are to be pared away on one fide for the length of three inches, and the flock or branch where the graft is to be united must be served in the fame manner, fo that the two may join equally and the fap meet. A little tongue is then to be cut upwards in the graft, and a notch made in the flock to admit it; fo that when they are joined, the tongue will prevent their slipping, and the graft will more closely unite to the stock. Having thus brought them exactly together, they must be tied with some bass, or worfted, or other foft tying; and then the place must be covered with fome grafting clay, to prevent the air from drying the wound, and the wet from rotting the flock. A flake must be fixed in the ground, to which both the flock and the graft must be tied to prevent the winds from displacing them. When they have remained in this state for four months, they will be fufficiently united, and the graft may then be cut off from the mother-tree, observing to slope it close to the flock; and at this time there should be fresh clay laid all round the part. This operation should be performed in April or May, that the graft may be perfectly united to the flock before the enfuing winter.

Inarching is chiefly practifed upon oranges, myrtles, jeffamines, walnuts, firs, and fome other trees which do not fucceed well in the common way of grafting. But it is a wrong practice when orange-trees are defigned to grow large, for these are seldom long-lived

after the operation.

INAUGURATION, the coronation of an emperor or king, or the confectation of a prelate: fo called from the ceremonies used by the Romans, when they were

received into the college of augurs.

INCA, or YNCA, a name given by the natives of Peru to their kings and the princes of the blood. Pedro de Cieca, in his Chronicles of Peru, gives the origin of the incas; and fays, that that country was, for a long time, the theatre of all manner of crimes, of war, diffention, and the most dreadful disorders, till at last two brothers appeared, one of whom was called Mangocapa; of this person the Peruvians relate many wonderful stories. He built the city of Cusco, made laws, established order and harmony by his wife regulations; and he and his descendants took the name of inea, which fignifies king or great lord. Thefe incas became fo powerful, that they rendered themselves mafters of all the country from Pasto to Chili, and from,

Incamera- the river Maule on the fouth to the river Augasmago otherwise it is only a trespats. This offence is called incense tion on the north; these two rivers forming the bounds ar fon in our law. Incendiary, of their empire, which extended above thirteen hun-Incest. Among the ancients, criminals of this kind were to dred leagues in length. This they enjoyed till the di-

visions between Inca Guascar and Atabalipa; which the Spaniards laying hold of, made themselves masters of the country, and destroyed the empire of the incas.

INCAMERATION, a term used in the chancery of Rome, for the uniting of lands, revenues, or other

rights, to the pope's domain.

INCANTATION, denotes certain ceremonies, accompanied with a formula of words, and supposed to be capable of raising devils, spirits, &c. See CHARM,

INCAPACITY, in the canon-law, is of two kinds: 1. The want of a difpensation for age in a minor, for legitimation in a baftard, and the like : this renders the provision of a benefice void in its original. 2. Crimes and heinous offences, which annul provisions

at first valid.

INCARNATION, in theology, fignifies the act whereby the Son of God affumed the human nature; or the myffery by which Jesus Christ, the eternal word, was made man, in order to accomplish the work of our falvation. The era used among Christians, whence they number their years, is the time of the incarnation, that is, of Christ's conception in the virgin's womb.

This era was first established by Dionysius Exiguus, about the beginning of the fixth century, till which time

the era of Dioclefian had been in ufe.

Some time after this, it was confidered, that the years of a man's life were not numbered from the time of his conception, but from that of his birth: which occasioned them to postpone the beginning of this era for the space of one year, retaining the cycle of Diony-

fius entire in every thing elfe.

At Rome they reckon their years from the incarnation or birth of Chirft, that is, from the 25th of December, which cuftom has obtained from the year 1431. In France, and feveral other countries. they also reckon from the incarnation: but then they differ from each other in the day of the incarnation, fixing it, after the primitive manner, not to the day of the birth, but conception of our Saviour. Though the Florestines retain the day of the birth, and begin their year from Christmas.

INCARNATION (formed from in, and caro "flesh",) in furgery, fignifies the healing and filling up of ulcers and wounds with new flesh. See SURGERY.

INCARNATIVES, in furgery, medicines which affir nature in filling up wounds or ulcers with flesh;

or rather remove the obstructions thereto.

INCENDIARY, in law, is applied to one who is guilty of maliciously fetting fire to another's dwelling house, and all outhouses that are parcel thereof, though not centiquous to it or under the same roof, as barns and flables. A bare intent or attempt to do this, by actually fetting fire to a house, unless it abfolutely burns, does not fall within the description of incendit et combussit. But the burning and consuming of any part is fufficient; though the fire be afterwards extinguished. It must also be a malicious burning; Nº 165.

be burnt. Qui ades, acervumque frumenti juxta domum positum sciens, prudensque dolo malo combusterit, vinctus ioni

The punishment of arfon was death by our ancient Saxon laws and by the Gothic constitutions: and in the reign of Edward I. incendiaries were burnt to death. The stat. 8 Hen VI c. 6. made the wilful burning of houses, under special circumstances, high acts of Edward VI. and Queen Mary. This offence was denied the benefit of clergy by 21 Hen. VIII c. 1. which statute was repealed by 1 Edw. VI. c. 12; and arfon was held to be ousted of clergy, with refpect to the principal, by inference from the stat. 4 and 5 P. and M. c. 4. which expressly denied it to the acceffory; though now it is expressly denied to the principal also, by 9 Geo. I. c. 22.

INCENSE, or FRANKINCENSE, in the materia medica, &c. a dry refinous fubstance, known among au-

thors by the names THUS and OLIBANUM.

Incense is a rich perfume, with which the Pagans, and the Roman-Catholics still, perfume their temples, altars, &c .- The word comes from the Latin incensum, q. d. burnt; as taking the effect for the thing itself.

The burning of incense made part of the daily fervice of the ancient Jewish church. The priests drew lots to know who should offer it: the destined person took a large filver difh, in with was a cenfer full of incense; and being accompanied by another priest carrying fome live coals from the altar, went into the temple. There, in order to give notice to the people, they ftruck upon an inftrument of brafs placed between the temple and the altar; and being returned to the altar, he who brought the fire left it there, and went away. Then the offerer of incense having faid a prayer or two, waited the fignal, which was the burning of the holocauft; immediately upon which he fet fire to the incenfe, the whole multitude continuing all the time in prayer. The quantity of incense offered each day was half a pound in the morning and as much at night.

One reason of this continual burning of incense might be, that the multitude of victims that were continually offered up, would have made the temple fmell like a flaughter house, and consequently have inspired the comers rather with difgust and aversion, than awe and reverence, had it not been overpowered by the agree-

able fragrance of those perfumes.

INCEPTIVE, a word used by Dr Wallis to express such moments, or first principles, which, though of no magnitude themselves, are yet capable of producing fuch as are. Thus a point has no magnitude itfelf, but is inceptive of a line which it produces by its motion. So a line, though it have no breadth, is yet inceptive of breadth; that is, it is capable, by its motion, of producing a furface which has breadth, &c.

INCEST, the crime of venereal commerce between persons who are related in a degree wherein marriage

is prohibited by the law of the country.

Some are of opinion, that marriage ought to be permitted between kinsfolks, to the end that the af-

Incident.

fection fo necessary in marriage might be heightened by this double tie; yet the rules of the church have formerly extended this prohibition even to the feventh degree; but time has now brought it down to the third or fourth degree.

Most nations look on incest with horror, Persia and Egypt alone excepted. In the history of the ancient kings of those countries we meet with instances of the brother's marrying the fifter; the reafon was, because they thought it too mean to join in alliance with their own fubiects, and still more fo to have married into

any foreign family. INCEST Spiritual, a crime committed in like manner between persons who have a spiritual alliance by means

of baptism or confirmation. Spiritual incest is also understood of a vicar, or other beneficiary, who enjoys both the mother and daughter; that is, holds two benefices, the one whereof depends upon the collation of the other.

Such a spiritual incest renders both the one and the

other of these benefices vacant.

INCH, a well-known measure of length; being the twelfth part of a foot, and equal to three barly-corns in length

INCH of Candle, (fale by). See CANDLE.

INCH (contracted from the Gaelic innis "an island"). a word prefixed to the names of different places in Scotland and Ireland.

INCH-Colm or Columba, the ifle of Columba, an ifland fituated on the frith of Forth in Scotland, and famous

for its monastery. See FORTH.

This monastery was founded about 1123, by Alexander I. on the following occasion. In passing the frith of Forth he was overtaken with a violent storm, which drove him to this island, where he met with the most hofpitable reception from a poor hermit, then reliding here in the chapel of St Columba, who, for the three days that the king continued there tempest-bound, entertained him with the milk of his cow, and a few shell-fish. His majesty, from the fense of the danger he had escaped, and in gratitude to the faint to whom he attributed his fafety, vowed fome token of respect: and accordingly founded here a monastery of Augustines, and dedicated it to St Columba. Allan de Mortimer, lord of Aberdour, who attended Edward III. in his Scotch expedition, bestowed half of those lands on the monks of this island, for the privilege of a family burialplace in their church .-- The buildings made in confequence of the piety of Alexander were very confiderable. There are still to be feen a large square tower belonging to the church, the ruins of the church, and of feveral other buildings. The wealth of this place in the time of Edward III. proved fo strong a temptation to his fleet, then lying in the Forth, as to suppress all the horror of facrilege and respect to the fanctity of the inhabitants. The English landed, and spared not even the furniture more immediately confecrated to divine worship. But due vengeance overtook them; for in a storm which instantly followed, many of them perished; those who escaped, struck with the justice of the judgment, vowed to make ample recompence to the injured faint. The tempest ceased; and they made the promised atonement.-The Danish monument, figured by Sir Robert Sibbald, lies on the fouth-east fide of the building, on a rifing ground. It is of a rigid

VOL. IX. Part I.

form, and the furface ornamented with fcale-like figures. At each end is the representation of a human

INCH-Keith, a fmall island situated in the same frith, midway between the port of Leith and Kinghorn on

the opposite shore. See FORTH.

This island is said to derive its name from the gallant Keith who fo greatly figualized himfelf by his valour in 1010, in the battle of Barry, in Angus, against the Danes; after which he received in reward the barony of Keith, in Lothian, and this little isle. In 1540 the English fleet, fent by Edward VI. to affift the lords of the congregation against the queen-dowager, landed, and began to fortify this island, of the importance of which they grew fenfible after their neglect of fecuring the port of Leith, fo lately in their power. They left here five companies to cover the workmen under the command of Cotterel; but their operations were foon interrupted by M. Desfe, general of the French auxiliaries, who took the place, after a gallant defence on the part of the English. The Scots kept possession for some years; but at last the fortifications were destroyed by act of parliament, to prevent it from being of any use to the former. The French gave it the name of L'isse des chevaux, from its property of foon fattening horfes. -In 1497, by order of council, all venereal patients in the neighbourhood of the capital were transported there, ne quid detrimenti respublica caperet.

INCH-Garvie, a fmall ifland, also lying in the frith

of Forth. See FORTH.

See WITCHCRAFT.

INCHOA'TIVE, a term fignifying the beginning of a thing or action; the same with what is otherwise called inceptive.

INCHOATIVE verbs, denote, according to Priscian and other grammarians, verbs that are characterifed by the termination fco or fcor, added to their primitives : as augesco from augeo, calesco from caleo, dulcesco from dulcis, ira/cor from ira, &c.

INCIDENCE, denotes the direction in which one body strikes on another. See Offics and Mechanics.

Angle of INCIDENCE. See ANGLE.

INCIDENT, in a general fenfe, denotes an event,

or a particular circumstance of some event.

INCIDENT, in law, is a thing appertaining to, or following another, that is more worthy or principal. A court-baron is inseparably incident to a manor; and a court of pie powders to a fair.

INCIDENT diligence, in Scots law, a warrant granted by a lord ordinary in the court of fession, for citing witnesses for proving any point, or for production of any writing necessary for preparing the cause for a final determination, or before it goes to a general

INCIDENT, in a poem, is an episode, or particular action, joined to the principal action, or depending

A good comedy is to be full of agreeable incidents. which divert the spectators, and form the intrigue-The poet ought always to make choice of fuch incidents as are susceptible of ornament suitable to the nature of his poem. The variety of incidents well conducted makes the beauty of an heroic poem, which ought always to take in a certain number of incidents

out too foon. INCINERATION, (derived from in, and cinis, Inconti-" ashes,") in Chemistry, the reduction of vegetables nence.

into ashes, by burning them gently.

INCISIVE, an appellation given to whatever cuts or divides: thus, the foreteeth are called dentes incifiwi, or cutters; and medicines of an attenuating nature.

incidents, or incifive medicines.

INCLE, a kind of tape made of linen yarn.

INCLINATION, is a word frequently used by mathematicians, and fignifies the mutual approach, tendency, or leaning of two lines or two planes towards each other, fo as to make an angle.

INCLINATION in a moral fense. See APPETITE. INCLINED PLANE, in mechanics, one that makes

an oblique angle with the horizon. See MECHANICS. INCOGNITO, or INCOG, is applied to a person who is in any place where he would not be known: but it is more particularly applied to princes, or great men, who enter towns, or walk the fireets, without their ordinary train or the usual marks of their distinc-

tion and quality.

INCOMBUSTIBLE CLOTH. See ASBESTOS. On this Cronftedt observes, that the natural store of the afbesti is in proportion to their economical use, both being very inconfiderable. " It is an old tradidion (fays he), that in former ages they made clothes of the fibrous afbefti, which is faid to be composed by the word by fus; but it is not very probable, fince if one may conclude from fome trifles now made of it, as bags, ribbons, and other things, fuch a drefs could neither have an agreeable appearance, nor be of any conveniency or advantage. It is more probable that the Scythians dreffed their dead bodies, which were to be burned, in a cloth manufactured of this stone; and this perhaps has occasioned the above fable." M. Magellan confirms this opinion of Cronstedt's, and informs us that some of the Romans also inclosed dead bodies in cloth of this kind. In the year 1756 or 1757 he tells us, that he faw a large piece of afbeftos cloth found in a stone tomb, with the ashes of a Roman, as appeared by the epitaph. It was kept, with the tomb also, if our author remembers rightly, in the right-hand wing of the Vatican library at Rome. The under-librarian, in order to flow that it was incombustible, lighted a candle, and let some drops of wax fall on the cloth, which he fet on fire with a candle in his prefence without any detriment to the cloth. Its texture was coarfe, but much fofter than he could have expected.

INCOMBUSTIBLE, fomething that cannot be

burnt or confumed by fire. See Asbestos.

INCOMMENSURABLE, a term in geometry, used where two lines, when compared to each other. have no common measure, how small soever, that will exactly measure them both. And in general, two quantities are faid to be incommensurable, when no third quantity can be found that is an aliquot part of both.

INCOMMENSURABLE Numbers, are such as have no common divifor that will divide them both equally.

INCOMPATIBLE, that which cannot subfift with another without destroying it: thus cold and heat are incompatible in the same subject, the strongest overcoming and expelling the weakest.

INCONTINENCE, inordinacy of the fexual ap-

TITY and CONTINENCE. INCONTINENCE, in the eye of law, is of divers kinds; Incumbent.

as in cases of bigamy, rapes, fodomy, or buggery, getting baftards; all which are punished by flatute. See 25 Hen. VIII. cap. 6. 18 Eliz. cap. 7. 1 Jac. I. cap. 11. Incontinency of priefts is punishable by the ordinary.

by imprisonment, &c. I Hen. VII. cap. 4. INCONTINENCE, in medicine, fignifies an inability

in any of the organs to retain what should not be difcharged without the concurrence of the will. But incontinence is most frequently used with regard to an involuntary discharge of urine otherwise called diabetes. See MEDICINE-Index.

INCORPORATION, in pharmacy, is much the fame as impattation, being a reduction of dry fubftances to the confiftence of a patte, by the admixture of fome fluid: thus pills, boles, troches, and plafters, are made by incorporation. Another incorporation is when things of different confidencies are by digeftion reduced to one common confiftence.

INCORPORATION OF Body-Corporate. See CORPORA-

INCORPOREAL, spiritual; a thing, or substance, which has no body. Thus the foul of man is incorporeal, and may fublist independent of the body. See METAPHYSICS

INCORRUPTIBLE, that which cannot be corrupted. Thus spiritual substances, as angels, human fouls, &c. and thus also glass, gold, mercury, &c. may

be called incorruptible.

INCORRUPTIBLES, INCORRUPTIBLES, the name of a fect which forang out of the Eutychians .-Their diftinguishing tenet was, that the body of Jesus Christ was incorruptible; by which they meant, that after and from the time wherein he was formed in the womb of his holy mother, he was not susceptible of any change or alteration; not even of any natural and innocent passions, as of hunger, thirst, &c. so that he eat without any occasion, before his death, as well as after his refurrection. And hence it was that they took their name.

INCRASSATING, in pharmacy, &c. the rendering of fluids thicker by the mixture of other fubstances less fluid, or by the evaporation of the thinner

INCUBATION, the action of a hen, or other fowl, brooding on her eggs. See HATCHING.

INCUBUS, NIGHT-MARE, a difeate confifting in. an oppression of the breast, so very violent, that the patient cannot spéak or even breathe. The word is derived from the Latin incubare, to "lie down" on any thing and press it: the Greeks call it ipialing q. d. faltator, "leaper," or one that rusheth on a person.

In this difease the fenses are not quite loft, but drowned and aftonished, as is the understanding and imagination; fo that the patient feems to think fome huge weight thrown on him, ready to strangle him. Children are very liable to this diftemper; so are fat people, and men of much study and application of mind; by reason the stomach in all these finds some difficulty in digeftion.

INCUMBENT, a clerk or minister who is resident on his benifice; he is called incumbent, because he does,

recurvation or at least ought to, bend his whole study to discharge the ancient church. Elizabeth was not disposed to Indepen-

the cure of his church.

dents.

INCURVATION of the RAYS of LIGHT, their bending out of a rectilinear straight course, occasioned by refraction. See OPTICS.

INCUS, in anatomy, a bone of the internal ear, fomewhat refembling one of the anterior dentes mo-

lares. See Anatomy, no 141. INDEFEASIBLE, a term in law for what cannot be defeated or made void; as an indefeafible estate of inheritance, &c. INDEFEASIBLE Right to the Throne. See HEREDI-

TARY Right.

INDEFINITE, that which has no certain bounds,

or to which the human mind cannot affix any. INDEFINITE, in grammar, is understood of nouns, pronouns, verbs, participles, articles, &c. which are left in an uncertain indeterminate fenfe, and not fixed

to any particular time, thing, or other circumstance. INDELIBLE, fomething that cannot be cancelled

or effaced

INDEMNITY, in law, the faving harmlefs; or a writing to fecure one from all damage and danger that may enfue from any act.

INDENTED, in heraldry, is when the outline of an ordinary is notched like the teeth of a faw.

INDENTURE, in Law, a writing which comprifes fome contract between two at leaft; being indented at top, answerable to another part which has

the fame contents. See DEED.

INDEPENDENTS, a feet of Protestants fo called from their maintaining that each congregation of Chrisftians, which meets in one house for publick worship, is a complete church, has fufficient power to act and perform every thing relating to religious government within itself, and is in no respect subject or accountable to other churches.

The Independents, like every other Christian fect, Their ori- derive their own origin from the practice of the apostles in planting the first churches; but they were unknown in modern times till they arose in England during the reign of Elizabeth. The hierarchy eftablished by that princes in the churches of her dominions, the vestments worn by the clergy in the celebration of divine worship, the book of common prayer, and above all the fign of the crofs used in the administration of baptism, were very offensive to many of her fubjects, who during the perfecutions of the former reign had taken refuge among the Protestants of Germany and Geneva. Those men thought that the church of England refembled, in too many particulars, the antichristian church of Rome; and they called perpetually for a more thorough reformation and a purer worship. From this circumstance they were stigmatized by their adverfaries with the general name of Puritans, as the followers of Novatian (A) had been in

comply with their demands; and it is difficult to fav what might have been the iffue of the contest, had the Puritans been united among themselves in sentiments, views, and measures. But the case was quite otherwife. That large body, composed of persons of different ranks, characters, opinions, and intentions, and unanimous in nothing but in their antipathy to the forms of doctrine and discipline that were established by law, was all of a fudden divided into a variety of fects. Of these the most famous was that which was formed about the year 1581 by Robert Brown, a man infinuating in his manners, but unfteady and inconfiftent in his views and notions of men and things. See

BROWN. This innovator differed not in point of doctrine either from the church of England or from the rest of the Puritans; but he had formed notions then new and fingular. concerning the nature of the church and the rules of ecclefiaftical government. He was for dividing the whole body of the faithful into feparate focieties or congregations; and maintained, that fuch a number of perfons as could be contained in an ordinary place of worship ought to be considered as a church, and enjoy all the rights and privileges that are competent to an ecclefiaftical community. These small societies he pronounced independent, jure divino, and entirely exempt from the jurisdiction of the bishops, in whose hands the court had placed the reins of spiritual government; and also from that of presbyteries and synods, which the Puritans regarded as the supreme visible sources of ecclefiaftical authority. He also maintained, that the power of governing each congregation refided in the people; and that each member had an equal share in this government, and an equal right to order matters for the good of the whole lociety. Hence all points both of doctrine and discipline were submitted to the discussion of the whole congregation; and whatever was supported by a majority of voices passed into a law. It was the congregation also that elected certain of the brethren to the office of paltors, to perform the duty of public instruction, and the feveral branches of divine worship; reserving however to themselves the power of dismissing these ministers, and reducing them to the condition of private members, whenever they fhould think fuch a change conducive to the spiritual advantage of the community. It is likewife to be obferved, that the right of the pattors to preach was by no means of an exclusive nature, or peculiar to them alone; fince any member that thought proper to exhort or instruct the brethren, was abundantly indulged in the liberty of prophefying to the whole affembly. Accordingly, when the ordinary teacher or pastor had finished his discourse, all the other brethren were permitted to communicate in public their fentiments and illustrations upon any ufeful or edifying fubject. The

Indepenpents.

⁽a) The followers of Novatian were called Puritans, because they would not communicate with the Catholic church, under pretence that her communion was polluted by admitting those to the facred mysteries who through infirmity had facrificed to idols in times of perfecution. These unhappy men were not received by the church till after a long course of penance. The Novatians would not receive them at all, however long their penance, or however fincere their forrow, for their fin. In other respects, the ancient Puritans were, like the English, orthodox in the faith, and of irreproachable morals.

Indepen-

maintained and propagated these notions was in a high degree intemperate and extravagant. He affirmed, that all communion was to be broken off with those religious societies that were founded upon a different plan from his; and treated, more especially the church of England, as a spurious church, whose ministers were unlawfully ordained, whose discipline was popish and antichristian, and whose sacraments and institutions were deflitute of all efficacy and virtue. The fect of this hot-headed innovator, not being able to endure the fevere treatment which their own violence had brought upon them from an administration that was not diffinguished by its mildness and indulgence, retired into the Netherlands, and founded churches at Middlebourg in Zealand, and at Amsterdam and Levden in the province of Holland; but their establishments were neither folid nor lafting. Their founder returned into England; and having renounced his principles of separation, took orders in the established church, and obtained a benefice. The Puritan exiles. whom he thus abandoned, difagreed among themselves, were split into parties, and their affairs declined from day to day. This engaged the wifer part of them to mitigate the feverity of their founder's plan, and to foften the rigour of his uncharitable decisions.

And pro-

The person who had the chief merit of bringing about this reformation was one of their pattors called John Robinson, a man who had much of the solemn piety of the times, and no inconfiderable portion of learning. This well-meaning reformer, perceiving the defects that reigned in the discipline of Brown, and in the spirit and temper of his followers, employed his zeal and diligence in correcting them, and in newmodelling the fociety in fuch a manner as to render it less odious to its adversaries, and less liable to the just cenfure of those true Christians, who look upon charity as the end of the commandments. Hitherto the fect had been called Brownists; but Robinson having, in his Apology, affirmed, Calum quemlibet particularem esse totam, integram, et perfectam ecclesiam ex suis partibus constantem immediate et INDEPENDENTER (quoad alias ecclefias) fub ipfo Christo, -the fect was henceforth called Independents, of which the apologist was confidered as

the founder. The Independents were much more commendable than the Brownists. They surpassed them both in the moderation of their fentiments and in the order of their discipline. They did not, like Brown, pour forth bitter and uncharitable invectives against the churches which were governed by rules entirely different from theirs, nor pronounce them on that account unworthy of the Christian name. On the contrary, though they confidered their own form of ecclefiaftical government as of divine inflitution, and as originally introduced by the authority of the apostles, nay by the apostles themfelves, they had yet candour and charity enough to acknowledge, that true religion and folid piety might flourish in those communities which were under the jurisdiction of bishops or the government of synods and presbyteries. This is put beyond all doubt by Robinfon himfelf, who expresses his own private senticlear and precife words: " Profitemur coram Deo et are divines in vogue and power commonly the most

The zeal with which Brown and his affociates hominibus, adeo nobis convenire cum ecclefiis refor. Indepenmatis Belgicis in re religionis, ut omnibus et fingulis earundem ecclefiarum fidei articulis, prout habentur in harmonia confessionum fidei, parati simus subscribere. Ecclesias reformatas pro veris et genuinis habemus, cum üsdem in sacris Dei communionem profitemur, et. quantum in nobis eft, colimus." They were also much more attentive than the Brownists, in keeping on foot a regular ministry in their communities : for while the latter allowed promiscuously all ranks and orders of men to teach in public, the Independents had, and still have, a certain number of ministers, chosen respectively by the congregations where they are fixed: nor is any person among them permitted to speak in public, before he has submitted to a proper examination of his capacity and talents, and been approved of by the heads of the congregation.

This religious fociety still subfifts, and has produced divines as eminent for learning, piety, and virtue, as any church in Christendom. It is now distinguished from the other Protestant communities chiefly by the

two following circumstances.

1. The Independents reject the use of all creeds and In what confessions drawn up by sallible men, requiring of their they are teachers no other teft of orthodoxy than a declaration now diftinof their belief in the gospel of Jesus, and their adhe-guished rence to the Scriptures as the fole flandard of faith Protestants and practice.

2. They attribute no virtue whatever to the rite of ordination upon which fome other churches lay fo much stress; for the Independents declare, that the qualifications which conflitute a regular minister of the New Testament, are, a firm belief in the gospel, a principle of fincerc and unaffected piety, a competent flock of knowledge, a capacity for leading devotion and communicating infruction, a ferious inclination to engage in the important employment of promoting the everlatting falvation of mankind, and ordinarily an invitation to the pattoral office from fome particular fociety of Christians. Where these things concur, they confider a person as fitted and authorised for the difcharge of every duty which belongs to the ministerial function; and they believe that the imposition of the hands of bishops or presbyters would convey to him no powers or prerogatives of which he was not before poffeffed.

When the reformers separated from the church of

Rome, they drew up public confessions of faith or articles of religion, to which they demanded subscription from their respective followers. Their purpose in this was to guard against dangerous herefies, to ascertain the meaning of Scripture-language, and, we doubt not, to promote the unity of the spirit in the bond of peace. These were laudable ends; but of the means chosen for attaining them, the late Dr Taylor of Norwich, the glory of the Independent churches, and whose learning would have done honour to any church, expresses his opinion in the following indignant language: " How much foever the Christian world valueth these creeds and consessions, I consess, for my Their arown part, that I have no opinion of them. But we against the are told that they were generally drawn up by the use of ments and those of his community in the following ablett divines. But what evidence is there of this? creeds.

Indepen- knowing and upright? But granting that the refordents. mers were in those days the ablest divines; the ablest divines educated in Popish schools, notwithstanding any pretended learning, might comparatively be very weak and defective in feripture-knowledge, which was a thing in a manner new to them. In times of great ignorance they might be men of eminence; and yet far short of being qualified to draw up and decide the true and precise rules of faith for all Christians. Yea. their very attempting to draw up, decide, and eftablish, fuch rules of faith, is an incontestible evidence of their furprifing ignorance and weakness. How could they be able divines, when they imposed upon the consciences of Christians their own decisions concerning gospelfaith and doctrine? Was not this in fact to teach and constrain Christians to depart from the most fundamental principle of their religion, subjection and allegiance to Christ, the only teacher and language? But if they were able men, were they infallible? No: they publicly affirmed their own fallibility; and yet they acted as if they had been infallible, and could not be miltaken in prescribing faith and doctrine.

> " But even if they were infallible, who gave them commission to do what the Spirit of God had done already? Could the first reformers hope to deliver the truths of religion more fully and more clearly than the Spirit of God? Had they found out more apt expreffions than had occurred to the Holy Spirit? The Son of God 'fpake not of himself; but as the Father said unto him, fo he fpake' (John xii. 50). 'The Spirit of truth fpake not of himfelf; but whatfoever he heard, that he fpake' (John xvi. 13.). 'The things of God the apostles spake, not in the words which man's wifdom teacheth, but which the Holy Ghoft teacheth' (1 Cor. ii. 13.). If the Christian revelation was thus handed down to us from the Fountain of Light with fo much care and exactness, both as to matter and words, by the Son of God, by the Spirit, and by the apostles, who were the aucient doctors and bishops? or who were the first reformers? or who were any fynods or affemblies of divines, that they dared to model Chriftian faith into their own invented forms, and impose it upon the minds of men in their own devifed terms and expressions?

> " Hath Christ given authority to all his ministers, to the end of the world, to new mould his doctrines by the rules of human learning, whenever they think fit? or hath he delegated his power to any particular perfons? Neither the one nor the other. His doctrines are not of fuch a ductile nature; but stand fixed, both as to matter and words, in the Scripture. And it is at any man's peril, who pretends to put them, as they are rules of faith, into any new drefs or shape. I conclude therefore, that the first reformers, and all councils, fynods, and affemblies, who have met together to collect, determine, and decide, to prescribe and impose matters pertaining to Christian faith, have acted without any warrant from Christ, and therefore have invaded the prerogative of him who is the fole Prophet and Lawgiver to the church. Peace and unity, I know, is the pretended good defign of those creeds and confessions. But as God never sanctified them for those ends, fo all the world knows they have produced the contrary effects; discord, division, and the spilling of whole feas of Christian blood, for 1400 years together."

Such fentiments as these are now maintained by Indepen-Christians of various denominations; but they were first avowed by the Independents, to whom therefore the merit or demerit of bringing them to light properly belongs. Our readers will think differently of them according to their preconceived opinions; but it is not our province either to confirm or to confute them. They rife almost necessarily out of the independent scheme of congregational churches; and we could not suppress them without deviating from our fixed refolution of doing justice to all religious parties, as well those from whom we differ as those with whom we agree. It ought not, however, to be rashly concluded, that the Independents of the prefent age, merely because they reject the use of all creeds of human composition, doubt or disbelieve the doctrines deemed orthodox in other churches. Their predeceffors in the last century were thought to be more rigid Calvinifts than the Presbyterians themselves; as many of those may likewise be, who in the present century Not thereadmit not the confessions and formulas of the Calvinittic fore neceschurches. They acknowledge as divine truth every rodox, doctrine contained in the Scriptures; but they think that fcripture doctrines are most properly expressed in fcripture language; and the fame spirit of religious liberty, which makes them reject the authority of bishops and fynods in matters of discipline, makes them reject the same authority in matters of faith. In either case, to call any man or body of men their malters,

would, in their opinion, be a violation of the divine law, fince " one is their mafter, even Christ, and they

all are brethren."

In support of their scheme of congregational churches, ments for they observe, that the word **xxxorix, which we translate the indechurch, is always used in Scripture to fignify either apendency fingle congregation, or the place where a fingle congrega- of congretion meets. Thus that unlawful affembly at Epheius, gational brought together against Paul by the craftsmen, is called exxxnoia, a church (Acts xix. 32, 39, 41.) word, however, is generally applied to a more facred use; but still it fignifies either the body affembling, or the place in which it affembles. The whole body of the disciples at Corinth is called the church, and spoken of as coming together into one place (1 Cor. xiv. 23.) The place into which they came together we find likewife called a church; " when ye come together in the church, - when ye come together into one place" (1 Cor. xi. 18, 20.). Wherever there were more congregations than one, there were likewife more churches than one: Thus, " Let your women keep filence in the churches, ev Tais exxxnosais (1 Cor. xi. 18.) The whole nation of Ifrael is indeed called a church, but it was no more than a fingle congregation; for it had but one place of public worship, viz. first the tabernacle, and afterwards the temple. The Catholic church of Chill, his holy nation and kingdom, is likewife a fingle congregation, having one place of worthip, viz. heaven, where all the members affemble by faith and hold communion; and in which, when they shall all be fully gathered together, they will in fact be one glorious affembly. We find it called "the general affembly and church of the first-born, whose names are written in

Besides these, the Independent can find no other defoription of a church in the New Testament; not a

andepen- trace of a diocele or preflytery confilting of feveral dents. congregations all subject to one jurisdiction. The number of disciples in Jerusalem was certainly great before they were dispersed by the persecution in which Paul bore so active a part: vet they are never mentioned as forming diffinct affemblies, but as one affembly meeting with its elders in one place; fometimes in the temple, fometimes in Solomon's porch, and fometimes in an upper room. After the dispersion, the disciples who fled from Jerusalem, as they could no Jonger affemble in one place, are never called a church by themselves, or one church, but the churches of Judea, Samaria, and Galilee. (Acts ix. 31. Gal i. 22.) Whence the Independent concludes, that in Jerusalem the words church and congregation were of the fame import; and if fuch was the case there, where the gospel was first preached, he thinks we may reasonably expect to find it fo in other places. Thus when Paul on his journey calls the elders of the church of Ephefus to Miletus, he focaks to them as the joint overleers of a fingle congregation: "Take heed to yourfelves, and to all the flock, over which the Holy Ghott hath made you overfeers" (Acts xx. 28.) Had the church at Ephefus confifted of different congregations united under fuch a jurifdiction as that of a modern prefbytery, it would have been natural to fay, " Take heed to yourselves, and to the flocks over which the Holy Ghoft hath made you overfeers:" but this is a way of speaking of which the Independent finds not an instance in the whole New Testament. The facred writers, when speaking of all the Christians in a nation or province, never call them the church of fuch a nation or province, but the churches of Galatia (Gal. i. 2.), the churches of Macedonia (2 Cor. viii. 1.), the churches of Afia (1 Cor. xvi: 10.) On the other hand, when fpeaking of the disciples in a city or town, who might ordinarily affemble in one place, they uniformly call them a church; faying, the church of Antioch, the church at Corinth, the church of Ephelus, and the like.

In each of these churches or congregations there were elders or presbyters and deacons; and in every church there feems to have been more than one elder, in fome a great many, who all "laboured in word and doctrine." Thus we read (Acts xiv. 23.) of Paul and whose ffice Barnabas ordaining elders in every church; and (Acts xx. +7.) of a company of elders in the church of Epheas well as fus, who were exhorted to " feed the flock, and to govern. take heed to themselves and to all the flock over which the Holy Ghoft had made them overfeers:" but of fuch elders asare to be found in modern prefbyterian churches, who neither teach nor are apt to teach, the Independent finds no veftige in the Scriptures, nor in the earlieft uninfpired writers of the Christian church. The

rule or government of this prefbytery or eldership in a Indepenchurch is not their own but Christ's. They are not lords over God's heritage, nor can they pretend to more power over the disciples than the apoilles had. But when the administration of the apostles in the church of Jerusalem, and other churches where they acted as elders, is inquired into by an Independent, it does not appear to him that they did any thing of common concern to the church, without the confent of the multitude: nay, it feems they thought it necessary to judge and determine in discipline in presence of the whole church (Acts vi. 1 -6. xv. 22. 1 Cor. v. 3, 4, 5.) Excommunication and absolution were in the power of excommuthe church at Corinth, and not of the elders as diffin nication guished from the congregation (1 Cor. v. 2 Cor. ii.) and absolu Satan (1 Tim. i. 20.): but it is by no means clear that each conhe did it by himfelf, and not after the manner pointed at gregation. I Cor. v. 4, 5; even as it does not appear, from his faying, in one epittle, that the gift was given unto Timothy by the putting on of bis hands, that this was not done in the presbytery of a church, as in the other epiftle we find it actually was. The trying and judging of falle apostles was a matter of the first importance: but it was done by the elders with the flock at Ephefus (Rev. ii. 2. Acts xx. 28,); and that whole flock did in the days of Ignatius all partake of the Lord's fupper, and pray together in one (B) place. Even the power of binding and loofing, or the power of the keys, as it has been called, was by our Saviour conferred not upon a particular order of disciples, but upon the church: " If thy brother shall trespass against thee, go and tell him his fault between thee and him alone : if he shall hear thee, thou hast gained thy brother. But if he will not hear thee, then take with thee one or two more, that in the mouth of one or two witnesses every word may be established. And if he shall neglect to hear them, tell it unto the church : but if he neglect to hear the church, let him be unto thee as an keathen man and a publican. Verily I fay unto you, whatfoever ye shall bind on earth, shall be bound, &c. (St Mat. xviii. 15, 16, 17, 18.). It is not faid, if he shall neglect to hear the one or two, tell it to the elders of the church; far less can it be meant that the offended person should tell the cause of his offence to all the disciples in a presbytery or diocese consisting of many congregations: but he is required to tell it to that particular church or congregation to which they both belong; and the fentence of that affembly, pro- Of which nounced by its elders, is in a very folemn manner declared to be final, from which there lies no appeal to any jurifdiction on earth.

With respect to the constituting of elders in any church What conor congregation, the Independent reasons in the fol- flitutes ellowing ders in a

(B) The evidence upon which this is faid by Mr Glas (for the whole of this reasoning is extracted from his works), is probably the following passage in the epistle of Ignatius to the Ephesians: Et yap 1905 xail development προστυχη, &c. For if the prayer of one or two be of fuch force as we are told, how much more prevalent must that be which is made by the bishop and the whole church? He then that does not come together into the fame place with it, is proud, and hath condemned himself; for it is written, God relifteth the proud. Let us not therefore refift the bishop, that we may be the servants of God." The sentence, as it thus stands by itfelf, certainly countenances Mr Glas's scheme, but the reader who thinks any regard due to the testimony of Ignatius, will do well to perufe the whole epiftle as published by Vossius,

In each congrega tion more than one elder or prefbyter,

Indepen- lowing manner: The officers of Christ's appointment the description of the persons who should be elders of Indepenare either ordinary and permanent in the church, or they were extraordinary and peculiar to the planting of Christianity. The extraordinary were those who were employed in laying the plan of the gospel churches, and in publishing the New Testament revelation Such were the apostles, the chosen witnesses of our Smour's refurrection; fuch were the prophets inspired by the Holy Gholt for explaining infallibly the Old Testament by the things written in the New; and fuch were the evangelists, the apostles ministers. These can be fucceeded by none in that which was peculiar to them, because their work was completed by themselves. But they are fucceeded in all that was not peculiar to them by elders and deacons, the only two ordinary and permanent orders of ministers in the church. We have already feen, that it belongs to the office of the elder to feed the flock of Christ; and the only question to be fettled is, how men are ordinarily called to that office? for about the office of the deacon there is little or no dispute. No man now can pretend to be so called of God to the ministry of the word as the apostles and other inspired elders were, whom he chose to be the publishers of his revealed truth, and to whose mission he bore witness in an extraordinary manner. But what the apostles were to those who had the divine oracles from their mouths, that their writings are to us: and therefore as no man can lawfully pretend a call from God to make any addition to those writings, fo neither can any man pretend to be lawfully called to the ministry of the word already written but in the manner which that word directs. Now there is nothing of which the New Testament speaks more clearly than of the characters of those who should exercise the office of elders in the church, and of the actual exercife of that office. The former are graphically drawn in the epiftles to Timothy and Titus; and the latter is minutely described in Paul's discourse to the Ephesian elders, in Peter's exhortation to elders, and our Lord's commission to those ministers, with whom he promised to be always present even unto the end of the world. It is not competent for any man or body of men to add to, or diminish from, the description of a gospel minifter given in these places, so as to infift upon the neceffity of any qualification which is not there mentioned, or to dispense with any qualification as needless which is there required. Neither has Jefus Chrift, the only legislator to the church, given to any mini-Arguments sters or people any power or right whatfoever to call, efficacy of fend, elect, or ordain, to that office any person who is every kind not qualified according to the description given in his of minife- law; nor has he given any power or right to reject the rial ordina leaft of them who are fo qualified, and who delire the office of a bishop or elder. Let a man have hands laid upon him by fuch as could prove an uninterrupted defcent by imposition of hands from the apostles; let him be fet apart to that office by a company of ministers themselves, the most conformable to the scripture character, and let him be chosen by the most holy people on earth; yet if he answer not the New Testament manded to do in point of gratitude, what is made hiss description of a minister, he is not called of God to own personal act, an act expressive of certain dutiful that office, and is no minister of Christ, but is indeed and pious affections, can possibly be restricted to the inrunning unfent. No form of ordination can pretend termediate offices or instrumentality of others, who active

the church; and the laying on of hands, whether by bishops or presbyters, is of no more importance in the mission of a minister of Christ, than the waving of one's hand in the air or the putting of it into his bofom; for now when the power of miracles has ceated. it is obvious that fuch a rite, by whomfoever performed, can convey no powers, whether ordinary or extraordinary. Indeed it appears to have been fometimes used even in the apostolic age without any such intention. When Paul and Barnabas were feparated to the particular employment of going out to the Gentiles, the prophets and teachers at Antioch " prayed and laid their hands on them:" But did this ceremony confer upon the two apostles any new power or authority to act as ministers of Christ? Did the imposition of hands make those shining lights of the gospel one whit better qualified than they were hefore to convert and baptize the nations, to feed the flock of God, to teach, rebuke, or exhort, with all long fuffering and doctrine It cannot be pretended. Paul and Barnabas had undoubtedly received the Holy Ghoft before they came to Antioch; and as they were apostles, they were of course authorised to discharge all the functions of the inferior and ordinary ministers of the gospel. In a word, whoever in his life and converfation is conformable to the character which the inspired writers give of a bishop or elder, and is likewife qualified by his "mightiness in the scripture" to discharge the duties of that office, is fully authorised to administer the fa- And even craments of baptism and the Lord's supper, to teach, ag and the exhort, and rebuke, with all long fuffering and doc-necessity of trine, and has all the call and mission which the Lord call. now gives to any man; whilft he who wants the qualifications mentioned, has not God's call, whatever he may have; nor any authority to preach the gospel of Christ, or to dispense the ordinances of his religion.

From this view of the Independent principles, which is faithfully taken from their own writers, it appears, that, according to them, even the election of a congregation confers upon the man whom they may choose for their paftor no new powers, but only creates a new relation between him and a particular flock, giving him an exclusive right, either by himself or in conjunction with other pastors constituted in the same manner, to exercise among them that authority which he derives immediately from Christ, and which in a. greater or less degree is possessed by every fincere Chri-Itian according to his gifts and abilities. Were the ministers of the gospel constituted in any other way than this; by imposition of hands, for instance, in succession from the apostles; the case of Christians would, in the opinion of the Independents, be extremely hard, and the ways of God scarcely equal. We are strictly. commanded not to forfake the affembling of ourfelves: together, but to continue fledfast in the apostles doctrine and fellowship, and in the breaking of bread, and in prayer : " but can any man (afks one of their advocates) bring himself to believe, that what he is comto fuch a clear foundation in the New Testament as by powers which he can neither give nor take away Tax

sion,

India.

Indetermi- To suppose a thing necessary to my happiness, which is not in my own power, or wholly depends upon the Index, good pleafure of another, over whom I have no authority, and concerning whose intentions and dispositions I can have no fecurity, is to suppose a constitution the most foolish and ill-natured, utterly inconsistent with our ideas of a wife and good Agent." Such are fome of the principal arguments by which the Independents maintain the divine right of congregational churches, and the inefficacy of ministerial ordination to conflitute a minister of Christ. We mean not to remark upon them, as the reader will find different conflitutions of the church pleaded for under the words PRESBYTERIANS and Episcopacy, to which werefer him for farther fatisfaction. We shall only observe at prefent, what it would be affectation to pass unnoticed, that the mode of reasoning adopted by the last quoted advocate for the Independents, if pushed as far as it will go, necessarily leads to consequences which will not

readily be admitted by a Christian of any denomination, or indeed by a ferious and confident Theilt. INDETERMINATE, in general, an appellation given to whatever is not certain, fixed, and limited; in which fense it is the same with indefinite.

INDEX, in anatomy, denotes the fore-finger. It is thus called from indico, I point or direct; because that finger is generally fo used: whence also the extenfor indicis is called indicator.

INDEX, in arithmetic and algebra, shows to what power any quantity is involved, and is otherwife called its exponent. See ALGEBRA, p. 412.

INDEX of a Book, is that part annexed to a book, referring to the particular matters or paffages therein contained.

INDEX of a Globe, is a little fivle fitted on to the northpole, and turning round with it, pointing to certain divisions in the hour-circle. It is sometimes also called gnomon. See GLOBE.

Expurgatory INDEX, a catalogue of prohibited books in the church of Rome.

The first catalogues of this kind were made by the inquifitors; and thefe were afterwards approved of by the council of Trent, after some alteration was made in them by way of retrenchment or addition. Thus an index of heretical books being formed, it was confirmed by a bull of Clement VIII, in 1595, and printed with feveral introductory rules; by the fourth of which, the use of the scriptures in the vulgar tongue is forbidden to all persons without a particular licence; and by the tenth rule it is ordained, that no book shall be printed at Rome without the approbation of the Pope's vicar, or some person delegated by the Pope; nor in any other places, unless allowed by the bishop of the diocese, or some person deputed by him, or by the inquisitor of heretical pravity.

The Trent index being thus published, Philip II. of Spain ordered another to be printed at Antwerp, in 1571, with confiderable enlargements. Another index was published in Spain in 1584; a copy of which

Nº 165.

was fnatched out of the fire when the English plundered Cadiz. Afterwards there were feveral expurgatory indexes printed at Rome and Naples, and particularly in Spain.

INDIA. See HINDOSTAN .- By the name of India the ancients understood only the western peninsula, on this fide the Ganges, and the peninfula beyond it, having little or no knowledge of the countries which lie farther to the eastward; though by the moderns ail those vast tracts from the eastern parts of the Persian empire to the islands of Japan, are confounded under the general name of East Indies. Even the ancients. though originally they were acquainted only with the western parts of Hindostan, gradually extended the name of India over the other countries they discovered to the eastward; fo that probably they would have involved all the rest in the same general designation, had they been as well acquainted with them as the moderns are. By whom these countries were originally peopled, is Conjecture a question which in all probability will never be resolved. concerning a question which in all probability will never be refored the peo-Certain it is, that some works in these parts discover pling of Inmarks of aftonishing skill and power in the inhabitants, dia. fuch as the images in the island of Elephanta; the rocking stones of immense weight, yet so nicely balanced that a man can move them with his hand; the observatory at Benares, &c. These stupendous works are by Mr Bryant attributed to the Cushites or Babylonians, the first distinct nation in the world, and who of confequence must for some time have possessed in a manner the fovereignty of the whole earth; and it can by no means appear improbable, that the fubjects of Nimrod, the beginning of whose kingdom was in Shinar, might extend themtelves eathward, and thus fill the fertile regions of the cast with inhabitants, without thinking it worth while for a long time to meddle with the less mild and rich countries to the weltward. Thus Why the would be formed that great and for some time infu-Indians and perable division betwixt the inhabitants of India and Western other countries; fo that the western nations knew not were ignoeven of the existence of the Indians but by obscure re-rant of one port; while the latter, ignorant of their own origin, another. invented a thousand idle tales concerning the antiquity of their nation, which some of the moderns have been credulous enough to believe and record as facts. The first among the western nations who distinguish-

ed themselves by their application to navigation and commerce, and who were of consequence likely to discover these distant nations, were the Egyptians and Phenicians. The former, however, foon loft their inclination for naval affairs, and held all fea-faring people in detectation as profane persons; though the ex. Account of tensive conquests of Sesoftris, if we can believe them, tion of Sesoftris them to the expediture of the exped must have in a great measure supplied this desect fost is to Without regard to the prejudice of his people against India. maritime affairs, he is faid to have fitted out a fleet of 400 fail in the Arabian Gulph or Red Sea, which conquered all the countries lying along the Erythrean Sea (A) to India; while the army led by himself march. ed through Asia, and subdued all the countries to the Ganges;

⁽A) This must not be confounded with the Red Sea, notwithstanding the similarity of names. The Ergthrean sea was that part of the ocean which is interposed betwist the straits of Babelmandel and the Mahabar coaft, now called the Indian fea or ocean.

Ganges; after which he croffed that river, and ad-India. vanced to the eaftern ocean.

Great disputes have been carried on with respect to this conqueror, and the famous expedition just now Dr Robert related; but the learned Dr Robertson, in his Diffons for oif-quisition concerning ancient India, declares himself in believing be better established than that of the aversion the Efairs : and the Doctor confiders it as impossible even

doubt whether any fuch expedition ever was made, for the following reaf ins. 1. Few hiltorical facts feem to gyptians entertained to feafaring people and naval affor the most powerful monarch to change in a few years a national habit confirmed by time and fanctified by religion. The very magnitude of the armaments is an argument against their existence; for besides the 400 thips of war, he had another fleet in the Mediterranean; and fuch a mighty navy could not have been conflructed in any nation unaccustomed to maritime affairs, in a few years 2. Herodotus makes no mention of the conquests of India by Sefostris, though he relates his history at some length. Our author is of opinion that the flory was fabricated betwixt the time of Herodotus and that of Diodorus Siculus, from whom we have the first account of this expedition. Diodorus himself informs us that he had it from the Egyptian priefts; and gives it as his opinion, that " many things they related flowed rather from a defire to promote the honour of their country than from attention to truth :" and he takes notice that both the Egyptian priefts and Greek writers differ widely from one another in the accounts which they give of the actions of Sefostris. 3. Though Diodorus declares that he has felected the most probable parts of the Egyptian narrative, yet there are still so many improbabilities, or rather impossibilities, contained in his relation, that we cannot by any means give credit to it. 4. For the reason just mentioned, the judicious geographer Strabo rejected the account altogether, and ranks the exploits of Sefostris in India with the fabulous ones of Bacchus

and Hercules. But whatever may be determined with regard to the Entercourfe Egyptians, it is certain that the Tyrians kept up a con-Rant intercourse with some parts of India by navigating the Arabian Gulf, now the Red Sea. Of this navigation they became mafters by taking from the Idumeans some maritime places on the coast of the Red Sea: but as the distance betwixt the nearest place of that Sea and Tyre was still considerable, the landcarriage would have been very tedious and expensive; for which reason it was necessary to become masters of a port on the eastern part of the Mediterrancan, near er to the Red Sea than Tyre, that fo the goods might be shipped from thence to Tyre itself. With this view they took possession of Rhinvelura, the nearest port on the Mediterranean to the Arabian Gulf; and to that port all the goods from India were conveyed by a much shorter and less expensive route than over land .- This is the first authentic account of any intercourse betwixt India and the western part of the world: and to this we are without doubt in a great measure to ascribe the vast wealth and power for which the city of Tyre was anciently renowned; for in other respects the whole territory of Phenicia was but of little confequence. Notwithstanding the frequency

VOL. IX. Fart I.

of the Tv

gians with

India.

give little or no account of them. The most particular description we have of the wealth, power, and commerce of ancient Tyre, is in the prophefies of Ezekiel; fo that if the Tyrians themselves kept any journals of their voyages, it is probable that they were entirely loft when the city was deftroyed by Alexander the Great.

Though the Jews, under the reign of David and The Jews Solomon, carried on an extensive and lucrative come did not vimerce, yet our author is of opinion that they did not fit India. trade to any part of India. There are only two places mentioned to which their ships failed, viz. Ophir and Tarshish; both of which are now supplifed to have been fituated on the eaftern coaft . Africa: the ancient Tarshish, according to Mr Bruce, wasthe present Mocha; and Ophir the kingdom of Sofala, fo remarkable in former times for its mines, that it was called by Oriental writerss the golden Sofala *.

Thus the Indians continued for a long time unknown a d Tarto the western nations, and undisturbed by them; pro-Jojos. bably in subjection to the mighty empire of Babylon, from which the country was originally peopled, or in all ance with it; and the possession of this vail region will easily account for the immense and otherwise almost incredible wealth and power of the ancient Babylonish monarchs. Soon after the destruction of that Conquests monarchy by the Persians, however, we find their mo- of the Pernarch Darius Hystaspes undertaking an expedition a-flam in Ingainst the Indians +. His conquests were not extendia five, as they did not reach beyond the territory watered the Himby the Indies; nevertheless, such as they were, the acquifition feems to have been very important, as the revenue derived from the conquered territory, according to Herodotus, was near a third of that of the whole Persian empire. According to his account, however, we mult form a much more diminutive opinion of the riches of the Persian monarchs than has commonly been done; fince Herodotus tells us, that the empire was divided into 20 fatrapies or governments; all of which yielded a revenue of 14,560 Euboic talents, amounting in the whole to 2,807,+37 l. fterling The amount of the revenue from the conquered provinces of India therefore must have been considerably short of a million. Very little knowledge of the country was diffused by the expedition of Darius, or the voyage of Scylax whom he employed to explore the coafts: for the Greeks paid no regard to the transactions of those whom they called Barbarians; and as for Scylax himfelf, he told fo many incredible stories in the account he gave of his voyage, that he had the misfortune to be disbelieved in almost every thing, whether true or false.

The expedition of Alexander is so fully taken notice Of Alexander of under the article HINDOSTAN, that nothing more re- der the mains to be faid upon it in this place, than that he went no farther into the country than the prefent territory of the Panjab, all of which he did not traverse. Its fouth west boundary is formed by a river anciently called the Hysudrus, now the Setlege. The breadth of this district from Ludhana on the Setlege, to Attock on the Indus, is computed to be 259 geographical miles in a ftraight line; and alexander's march, computed in the fame manner, did not exceed 200; nevertheless, by the spreading of his numerous army over of these voyages, however, the ancients are able to the country, and the exact measurement and delinea-

Under the article HINDOSTAN we have mentioned Why Alex-

Major Rennel's opinion concerning the filence of Alex- ander's hif-

tion of all his movements by men of science whom he monarch on the banks of the Ganges. The navigable India. employed, a very extensive knowledge of the western part of India was obtained. It is, however, furprifing, that having marched through fo many countries in the neighbourhood of India, where the people must have been well acquainted with the nature of the climate, the Macedonian conqueror did not receive any information concerning the difficulties he would meet with from the rains which fell periodically at a certain feafon of the year. It was the extreme diffress occafloped by them which made his foldiers finally refolve to proceed no farther; and no wonder indeed that they did adopt this refolution, fince Diodorus informs us, that it had rained inceffantly for 70 days before their departure. These rains, however, according to the testimony both of ancient and modern writers, fall only in the mountainous parts, little or none being ever feen in the plains. Ariftobulus informs us, that in the country through which Alexander marched, though heavy rains fell among the mountains, not a shower was feen in the plains below. The diffrict is now feldom vifited by Europeans; but major Rennel was informed by a person of credit, who had resided in the Panjab, that during great part of the S. W. monfoon, or at least in the months July, August, and part of September, which is the rainy feafon in most other parts of India, very little rain falls in the Delta of the Indies, except very near the fea, though the atmosphere is generally clouded, and very few showers fall throughout the whole feafon. Captain Hamilton relates, that when he vifited Tatta, no rain had fallen there for three years before. We may have some idea of what the Macedonians suffered by what happened afterwards to Nadir Shah, who, though possessed of vast wealth and power, as well as great experience in military affairs, yet loft a great part of his army in croffing the mountains and rivers of the Panjab, and in battles with the favage inhabitants who inhabit the countries betwixt the Oxus and the frontiers of Perfia. He marched through the same countries, and nearly in the same

By his voyage down the river Indus, Alexander contributed much more to enlarge our geographical knowledge of India than by all his marches and conquests by land. According to Major Rennel, the space of country through which he failed on the Indus, from the Hyphafis to the ocean, was not less than 1000 miles; and as, during the whole of that navigation, he obliged the nations on both fides the river to fubmit to him, we may be very certain that the country on each fide was explored to fome diffance. An exact account not only of his military operations, but of every thing worthy of notice relating to the countries through which he passed, was preserved in the journals of his three officers, Lagus, Nearchus, and Aristobulus; and these journals, Arrian informs us, he followed State of ln-in the compession of his history. From these authors we learn, that in the time of Alexander, the western part of that vast tract named India was possessed by feven very powerful monarchs. The territory of king Porus, which Alexander first conquered, and then reflored to him, is faid to have contained no fewer than 2000 towns; and the king of the Prasii had affembled an army of 20,000 cavalry, 2000 armed chariots, and a great number of elephants, to oppose the Macedonian

direction, that Alexander did.

rivers with which the Panjab country abounds, afforded then, and still continue to afford, an intercourse from one part to another by water: and as at that time these rivers probably had many ships on them for the purposes of commerce, Alexander might easily collect all the number he is faid to have had, viz. 2000; fince it is reported that Semiramis was opposed by double the number on the Indus when the invaded India. When Malimud Gazni also invaded this country, a fleet was collected upon the Indus to oppose him, confisting of the fame number of veffels. From the Aycen Akbery, also, we learn that the inhabitants of this part of India fill continue to carry on all their communication with each other by water; and the inhabitants of the Circar of Tatta alone have 40,000 vessels of various conftructions.

ander's historians about the expedition of Scylax; but torians take Dr Robertson accounts for it in another manner. "It the voyage is remarkable (fays he), that neither Nearchus, nor of Scylax. Ptolemy, nor Aristobulus, nor even Arrian, once mention the voyage of Scylax. This could not proceed from their being unacquainted with it, for Herodotus was a favourite author in the hands of every Greek who had any pretentions to literature. It was probably occasioned by the reasons they had to distrust the veracity of Scylax, of which I have already taken notice. Accordingly, in a speech which Arrian puts in the mouth of Alexander, he afferts, that, except Bacchus, he was the first who had passed the Indus; which implies that he disbelieved what is related concerning Scylax, and was not acquainted with what Darius Hyftaspes is said to have done in order to subject that part of India to the Perfian crown. This opinion is confirmed by Megasthenes, who resided a considerable time in India. He afferts, that, except Bacchus and Hercules (to whose fabulous expeditions Strabo is astonished that he should have given any credit), Alexander was the first who had invaded India. Arrian informs us that the Affaceni, and other people who inhabited the country now called Candahar, hal been tributary first to the Affyrians and then to the Medes and Persians. As all the fertile provinces on the north west of the Indus were anciently reckoned to be part of India, it is probable that what was levied from them is the fum mentioned in the tribute rollfrom which Herodotus drew his account of the annual revenue of the Persian empire, and that none of the provinces to the fouth of the Indus were ever fubject to the kings of Persia."-The Doctor differs from Mr Rennel with respect to the surprise which Alexander and his army expressed when they saw the high tides at the mouth of the Indus. This he thinks might very naturally have been the cafe, notwithstanding what Herodotus had written concerning the flux and reflux observable in the Red Sea. All that has been mentioned by Herodotus concerning this phenomenon is, that " in the Red Sea there is a regular ebb and flow. of the tide every day." No wonder therefore that the Macedonians should be surprised and terrified at the very high tides which presented themselves in the Indian ocean, which the few words of Herodotus above mentioned had by no means led them to ex-

pect

dia in the lexander.

India. pect. In the like manner the Romans were furprifed at the tides in the Atlantic, when they had conquered fome of the countries bordering upon that ocean. Cæfar describes the astonishment of his foldiers at a spring tide in Britain which greatly damaged his fleet; and indeed, confidering the very little rife of the tide in the Mediterranean, to which alone the Greeks and Romans had access, we may reckon the account given us by

Arrian highly probable. The country on each fide the Indus was found, in the time of Alexander, to be in no degree inferior in population to the kingdom of Porus already mentioned. The climate, foil, and productions of India, as well as the manners and customs of the inhabitants, are exactly described, and the descriptions found to correspond in a furprifing manner with modern accounts. The flated change of feafons, now known by the name of my of the particularities related under the article Hin- tinued fo long, as in that case " the ancients would poo, are to be wet with in the accounts of Alexander's have had a more accurate knowledge of that part of the expedition. His military operations, however, extended but a very little way into India properly fo called; no farther indeed than the modern province of Lahor, and the countries on the banks of the Indus from Moultan to the fea; though, had he lived to undertake another expedition as he intended, it is very bly have fet bounds to his conquefts but death or revolts in distant provinces of his empire. In order to fecure the obedience of those countries he subdued, Alexander found it necessary to build a number of for-Cities built tified cities; and the farther eastward he extended his conquests, the more necessary did he find this task. ander in In. Three he built in India itself; two on the banks of the Hydaspes, and a third on the Acesines, both navigable rivers, falling into the Indus after they have united their fireams. By means of these cities he intended not only to keep the adjacent countries in awe, but to promote a commercial intercourse betwixt different parts both by land and water. With this view alfo, on his return to Sufa, he furveyed in perfon the course of the Euphrates and Tigris, causing the cataracts or dams to be removed which the Persian moparchs had built to obstruct the navigation of these rivers, in conformity to a maxim of their fuperstition, that it was unlawful to defile any of the elements, which they imagined was done by navigators. After the navigation was opened in this manner, he proposed that the valuable commodities of India should be imported into the other parts of his dominions by means of the Persian Gulf; while through the Red Sea they were conveyed to Alexandria in Egypt, and thence difperfed all over Europe.

The death of Alexander having put an end to all his great schemes, the eastern part of his dominions devolved first on Pytho the son of Agenor, and after-

fubjection. With this view he undertook an ex- India. pedition into that country, partly to establish his authority more perfectly, and partly to defend the Expedition Macedonian territories against Sandracottus king of of Sciencus the Prasii, who threatened to attack them. The par- to India. ticulars of his expedition are very little known; Justin being the only author who mentions them, and his authority is but of little weight, unless corroborated by the testimony of other historians. Plutarch, who tells us that Seleucus carried his arms farther into India than Alexander, is subject to an imputation of the fame kind; but Pliny, whose authority is of confiderably greater weight, corroborates the testimony of Plutarch in this instance, tho' his words are fo obscure. that learned men differ in opinion concerning their meaning. Bayer thinks they imply that Seleucus marched from the Hyphasis, the boundary of Alexanmonfoons, the periodical rains, the fwellings and in- der's conquests, to the Hysudrus, from thence to Palibothundations of the rivers, with the appearance of the ra, and then to the month of the Ganges; the diffances of country during the time they continue, are particu- the principal flations being marked, and amounting in larly described. The descriptions of the inhabitants all to 2244 Roman miles. Notwithstanding this auare equally particular; their living entirely upon vege- thority, however, Dr Robertson thinks it very improtable food, their division into tribes or calls, with ma- bable that the expedition of Seleucus should have con-

country than they feem ever to have poffeffed."

The career of Seleucus in the east was stopped by Antigonus, who prepared to invade the western part of his dominions. The former was therefore obliged to conclude a treaty with Sandracottus, whom he allowed to remain in quiet possession of his territories: probable that he would have subdued a vassly greater but Dr Robertson is of opinion, that during the lifetract of country; nor indeed could any thing probatime of Seleucus, which continued 42 years after the death of Alexander, no diminution of the Macedonian territories took place. With a view of keeping Conjectures up a friendly intercourse with the Indian Prince, Se-concerning leucus fent Megasthenes, one of Alexander's officers, the situa to Palibothra, capital of the kingdom of the Prafii, libothra fituated on the banks of the Ganges. This city is by Dr Robertson supposed to be the modern Allahabad. feated at the conflux of the Juruna and Ganges, contrary to the opinion of Major Rennel, who supposes it to be Patna.* As Megasthenes resided in this city . See Him for a confiderable space of time, he had an opportunity doftan, no 4. of making many observations on the country of India in general; and these observations he was induced afterwards to publish. Unhappily, however, he mingled with his relations the molt extravagant fables. To him may be traced the ridiculous accounts of men with ears fo large that they could wrap themselves up in them; of tribes with one eye, without mouths or nofes, &c. whence the extracts from his book given by Arrian, Diodorus, and other ancient writers, can fcarcely be credited, unless confirmed by other evidence.

fucceff r of Sandracottus, we hear no more of the affairs of India with regard to the Macedonians, until the time of Antiochus the Great, who made a short incursion into India about 197 years after the death of Seleucus. All that we know of this expedition is, Expedition that the Syrian monarch, after finishing a war he car- of Antic wards on Sciences. The latter was very fenfible of ried on against the two revolted provinces of Parthia chus the the advantages to be derived from keeping India in and Bactria, entered India, where he obliged Sopha-India.

Account of Bactria.

gafenus, king of the country which he invaded, to pay 258 Roman miles through the barren defart of The- India. ritories.

After the lofs of India by the Syrians, an intercourfe the Grecian was kept up for fome time betwixt it and the Greek ships during this period fet lail from Berenice, and kingdom of kingdom of Bactria. This last became an independent coasting along the Arabian shore to the promontory flate about 60 years after the death of Alexander; and, of Syagrus, now Cape Rasalgate, held their course aaccording to the few hints we have concerning it long the coast of Persa till they arrived at the mouth in ancient authors, carried on a great traffic with of the western branch of the river Indus. They either India. Nay, the Bactrian monarchs are faid to have failed up this branch till they came to Pattala, now conquered more extensive tracts in that region than Tatta, fituated at the upper part of the Delta, or-Alexander himself had done. Six princes reigned o- continued their course to some other emporium on the ver this new kingdom in succession; some of whom, western part of the Indian coast. A more convenient elated with the conquests they had made and the power - course was afterwards found by sailing directly to Zithey had acquired, affumed the title of Great King, zenis, a place concerning which there is now some by which the Persian monarchs were distinguished in dispute. Montesquieu will have it to be the kingdom their highest folendor. Strabo informs us, that the of Sigertis, on the coast adjacent to the Indus, and which Bactrian princes were deprived of their territories by was conquered by the Bactrian monatchs; but Major the Scythian Nomades, who came from the country beyond the Iaxartes, and were known by the names of Afii, Pafiani, Tachari, and Scarauli. This is confirmed by the tellimony of fome Chinese historians quoted by M. de Guignes. According to them, about 126 years before the Christian æra, a powerful horde of Tartars, pushed from their native seats on the confines of China. and obliged to move farther to the west, passed the Iaxartes, and, pouring in upon Bactria like an irrefiftible torrent, overwhelmed that kingdom, and put an end to the dominion of the Greeks after it had lasted near

86 Intercourse betwixt E-

130 years. From this time to the close of the 15th century, all thoughts of establishing any dominion in India were totally abandoned by the Europeans. The only object now was to promote a commercial intercourse with that country; and Egypt was the medium by which that intercourse was to be promoted. Ptolemy the son of Lagus, and first king of Egypt, first raised the power and splendor of Alexandria, which he knew had been built by Alexander with a view to carry on a trade to India: and in order to make the navigation more fecure, he built the celebrated light house at Pharos; a work fo magnificent as to be reckoned one of the wonders of the world. His fon Ptolemy Philadelphus profecuted the fame plan very vigoroufly. In his time the Indian commerce once more began to centre in Tyre; but to remove it effectually from thence, he formed a canal between Arfinoe on the Red Sea, not far from the place where Suez now stands, and the Pelufiac or eaftern branch of the Nile. This canal was 100 cubits broad and 30 deep; fo that by means of it the productions of India might have been conveyed to Alexandria entirely by water. We know not whether this work was ever finished, or whether it was found ufeless on account of the dangerous navigation towards the northern extremity of the Red Sea; but whatever was the caufe, it is certain that no use was made of it, and a new city named Berenice, fituated almost under the tropic upon the western shore of the Red Sea, became the staple of Indian commerce From thence the goods were transported by land to Coptos, a

gum of money, and give him a number of elephants. bais: but Ptolemy caufed diligent fearen to be made It is probable that the fucceffors of Seleucus were obli- every where for fprings, and wherever these were found, ged foon after his death to abandon all their Indian ter- he built inns or caravanferas for the accommodation of travellers; and thus the commerce with India was carried on till Egypt became fubject to the Romans. The Rennel is of opinion that it was a port on the Malabar coaft. Dr Robertson does not pretend to decide this difpute; but is of opinion, that during the time of the Ptolemies very little progress was made in the discovery of India. He contests the opinion of Major Rennel, that " under the Ptolemics the Egyptians extended their navigation to the extreme point of the Indian continent, and even failed up the Ganges to Palibothra, now Patna." In this case he thinks that the interior parts of India must have been much better known to the ancients than we have any reason to believe they were. He owns indeed that Strabo mentions the failing up the Ganges, but then it is only curforily and in a fingle fentence; " whereas if fuch a confiderable inland voyage of above 400 miles, through a populous and rich country, had been cuftomary, or even if it had been ever performed by the Roman, Greek, or Egyptian traders, it must have merited a particular description, and must have been mentioned by Pliny and other writers, as there was nothing fimilar to it in the practice of navigation among the ancients."-The extreme danger of navigating the Red Sea in ancient times (which even in the prefent improved state of navigation is not entirely got over) feems to have been the principal reason which induced Ptolemy to remove the communication with India from Arfinoe to Berenice, as there were other harbours on the fame coast considerably nearer the Nilo than it. After the ruin of Coptos by the emperor. Dioclesian, the Indian commodities were conveyed from the Red Sea to the Nile from Coffeir, supposed by Dr Robertson to be the Philoteras Portus of Ptolemy, to Cous, the Vicus Apollinis, a journey of four days. Hence Cous from a fmall village became an opulent city; but in process of time, the trade from India removed from Cous to Kene, farther down the river. In. modern times fuch Indian goods as are brought by the Red Sea come from Gidda to Suez, and are carried across the Iithmus on camels, or brought by the caravan returning from the pilgrimage to Mecca.

It was to this monopoly of Indian commerce that Why the Egypt owed its valt wealth and power during the Syr an mecity diffant only three miles from the Nile, to which time of its Macedonian monarchs; but it appears fur-narchs did it was joined by a navigable canal. Thus, however, priling that no attempt was made by the Syrian mo not attempt there was a very tedious land-carriage of no less than narchs to rival them in it, especially as the latter were egyptians.

in possession of the Persian gulf, from whence they emperor Aurelian, however, it did not any more recover might have imported the Indian commodities by a much fhorter navigation than could be done by the Egyptians. For this neglect feveral reasons are affigned by our learned author. r. The Egyptians, under their Greek monarchs, apolied themselves to maritime affairs; and were in possession of such a powerful fleet as gave thema decided superiority at sea. 2. No intercourse by fea was ever kept up betwixt Perlia and India, on account of the aversion which the Persians had to maritime affairs. All the Indian commodities were then conveyed in the most tedious and difficult manner over land, and difperfed throughout the various provinces, partly by means of navigable rivers and partly by means of the Caipian fea. 3. Many of the ancients, by an unaccountable error in geography, imagined the Caspian sea to be a part of the great northern ocean; and thus the kings of Syria might hope to convey the Indian commodities to the European countries without attempting to navigate those seas which the Egyptianmonarchs deemed their own property. Seleucus Nicator, the first and greatest of the Syro-Macedonian monarchs, formed a project of joining the Euxine and Caspian seas by a navigable canal, which would have effectually answered the purpose, but was affassinated before he could put it in execution, and none of his fucceffors had abilities to execute fuch an undertaking. Alexander the Great had given orders, a little before his death, to fit out a fquadron on the Caspian sea, in order to difcover whether it had any communication with the northern ocean, the Euxine fea, or Indian ocean; but Dr Robertson initly thinks it surprising that such errors concerning this fea should have existed among the ancients, as Herodotus had long before described it properly in the following words: " The Caspian is a fea by itself, unconnected with any other. Its length is as much as a veffel with oars can fail in 15 days; and its greatest breadth as much as it can fail in eight days." Aristotle describes it in like manner, and infifts that it ought to be called a great lake, and

Intercourse of the Romans with India.

On the conquest of Egypt by the Romans the Indian commodities continued as usual to be imported to Alexandria in Egypt, and from thence to Rome; but befides this, the most ancient communication betwixt the eaftern and western parts of Asia seems never to have been entirely given up. Syria and Palestine are separated from McJopotamia by a defart; but the passage through it was much facilitated by its affording a station which abounded in water. Hence the possession of this station became an object of such confequence, that Solomon built upon it the city called in Syria Tadmor, and in Greek Palmyra. Both thefe names are expressive of its situation in a spot adorned with palm-trees. Though its fituation for trade may to us feem very unfavourable (being 60 miles from the Euphrates, by which alone it could receive the Indian commodities, and 203 from the nearest coast of the Mediterranean,) yet the value and fmall bulk of the goods in question rendered the conveyance of them by a long carriage over land not only practicable but Incrative and advantageous. Hence the inhabitants became opulent and powerful, and long maintained its independence even atter the Syrian empire became subject to Rome. After the reduction of Palmyra by the

its fplendor; the trade gradually turned into other channels, and the city was reduced to ruins, which ftill exist, and manifest its former grandeur. See PALMYRA.

The excellive eagerness of the Romans for Anatic luxuries of all kinds kept up an unceasing intercourse with India during the whole time that the empire continued in its power; and even after the destruction of the western part, it was kept up betwixt Constantinople and those parts of India which had been vitited tormerly by merchants from the weltern empire. Long be. New routes fore this period, however, a much better method of to India dif-

failing to India had been discovered by one Hippalus Hippalus the commander of an Indian ship, who lived about 80 years after Egypt had been annexed to the Roman empire. This man having observed the periodical shifting of the monfoons, and how fleadily they blew from the eaft or west during some months, ventured to leave the coaft, and fail boldly across the Indian ocean from the mouth of the Arabian gulf to Muliris, a port on the Malabar coaft: which difcovery was reckoned a matter of such importance, that the name of Hippalus was given to the wind by which he performed the voyage, Pliny gives a very particular account of the manner in which the Indian traffic was now carried on, mentioning the particular stages, and the distances between them, which are as follow. From Alexandria to Juliopolis was two miles; and there the cargo deftined for India was shipped on the Nile, and carried to Coptos. diftant 303 miles, the voyage being usually performed in twelve days. From Coptos they were conveyed by land to Berenice, diffant 258 miles, and halting at different stations as occasion required. The journey was finished on the 12th day; but by reason of the heat the caravan travelled only in the night. The ships left Berenice about midiummer, and in 30 days reached Ocelis, now Gella, at the mouth of the Arabian gulf. or Cane (now cape Fartaque) on the coast of Arabia Felix; from whence they tailed in 40 days to Musiris already mentioned. Their homeward voyage began early in the month of December; when tetting fail with a north-east wind, and meeting with a fouth or fouth-west one when they entered the Arabian gulf, the voyage was completed in lefs than a year. With regard to the fituation of Mufiris, as well as of Barace another Indian port to which the ancients traded, Major Rennel is of opinion, and Dr Robertson agrees with him, that they flood fomewhere between Goa and Tellicherry; and that probably the modern Meerzaw or Merjee is the Musiris, and Barcelore the Barace of the ancients.

Ptolemy, who flourished about 200 years after the ptolemy's commencement of the Christian æra, having the ad-account of vantage of fo many previous discoveries, gives a more India. particular description of India than what is to be met with in any of the ancient writers; notwithflanding which, his accounts are frequently inconfittent not only with modern discoveries, but with those of more ancientgeographers than himfelf. A most capital error in his geography is, that he makes the peninfula of India stretch from the Sinus Barygazenus, or gulf of Cambay, from west to east, instead of extending, according to its real direction, from north to fouth; and this error must appear the more extraordinary, when we considerthat Megaithenes had published a measurement of thiss

IND

peninfula nearly confonant to truth, which had been adopted with fome variations by Eratosthenes, Strabo, Diodorus Siculus and Pliny. His information concerning the fituation of places, however, was much more accurate. With respect to some districts on the castern part of the peninsula, as far as the Ganges, he comes nearer the truth than in his descriptions of any of the rest. These are particularly pointed out by M. D'Anville, who has determined the modern names of many of Plolemy's stations, as Kilkare, Negapatam, the mouth of the river Cauveri, Masulipatam, &c. The river Cauveri is the Chabaris of Ptolemy; the kingdom of Arcot, Arcati Regio; and probably, fays Dr Robertfon, the whole coast has received its present name of Coromandel from Sor Mandulam, or the kingdom of Soræ, which is fituated upon it. Ptolemy had likewife acquired fo much knowledge concerning the river Ganges, that he describes fix of its mouths, though his delineation of that part of India which lies beyond the Ganges is hardly less erroneous than that of the nearer peninfula. M. D' Anville, however, has been at great pains to elucidate these matters, and to illustrate those parts of the writings of Ptolemy which appear to be best founded. According to him, the golden-Cherfonefus of Ptolemy is the peninfula of Malacca; he supposes the gulf of Siam to be the great bay of Ptolemy: and the Sinæ Metropolis of the fame writer he looks upon to be Sin-hoa in the western part of the kingdom of Cochin-China, though Ptolemy has erred in its fituation no less than 50 degrees of longitude and 20 of latitude. M. Gosselin, however, differs from his countryman M. D'Anville, in a late work entitled "The Geography of the Greeks analysed; or the fystems of Eratofthenes, Strabo, and Ptolemy, compared with each other, and with the knowledge which the moderns have acquired." In the opinion of M. Goffelin, the Magnum Promontorium of Ptolemy is not Cape Romania at the fouthern extremity of the peninfula of Malacca, as M. D' Anville supposes, but the point Bragu, at the mouth of the river Ava. The great bay of Ptolemy he supposes not to be the gulf of Siam, but of Martaban. He endeavours to prove that the polition of Cattipnara, as laid down by Ptolemy, corresponds with that of Mergui, a fea-port ou the well of Siam; and that Thina, or Sina Metropolis, is not Sin-hoa, but Tana-ferim, a city on the fame river with Mergui; and he contends, that the Ibbadii infula of Ptolemy is not Sumatra, as D'Anville would have it, but one of the small isles which lie in a cluster off this coast. M. Gosselin is of opinion that the ancients never failed through the straits of Malacca, nor had any knowledge of the island of Sumatra, or of the eastern ocean.

The errors of Ptolemy have given occasion to a militake of more motern date, viaz that the ancients were acquainted with China. This arofe from the restemblance betwixt the name of that empire and the Sine of the ancients. The Ayeen Akbery informs us, that Chem was an ancient name of Pegu; whence, fays Dr Robertion, "sa stat country borders upon Ava, where M. Golfelin places the great promontory, this near refemblance of names may appear perhaps to confirm his opinion that Sine. Metropolis was fituated on this coalt, and not fo far eaft as M. D'Anville has placed it."

Thus we fee that the peninfula of Malacca was in all India. probability the boundary of the ancient discoveries by fea; but by land they had correspondence with coun- Boundary tries still farther distant. While the Seleucidæ conti- of the nanued to enjoy the empire of Syria, the trade with In- vigation dia continued to be carried on by land in the way al- of the anready mentioned. The Romans having extended cients. their dominions as far as the river Euphrates, found this method of conveyance still established, and the trade was by them encouraged and protected. The progress of the caravans being frequently interrupted by the Parthians, particularly when they travelled towards those countries where filk and other of the most valuable manufactures were procured, it thence became an object to the Romans to conciliate the friendship of the fovereigns of those distant countries. That fuch an attempt was actually made, we know from the Chinese historians, who tell us, that Antoun, by whom they mean the Emperor Marcus Antoninus, the king of the people of the western ocean, sent an embasiv to Ounti, who reigned in China in the 166th year of the Christian era; but though the fact is mentioned, we are left entirely in the dark as to the iffue of the negociations. It is certain, however, that during the times of the Romans fuch a trade was carried on; and as we cannot suppose all those who visited that dillant region to be entirely destitute of science, we may reafonably enough conclude, that by means of some of these adventurers, Ptolemy was enabled to determine the fituation of many places which he has laid down in his geography, and which correspond very nearly with

the observations of modern times.

With regard to the Indian islands, confidering the Fer and its little way they extended their navigation, they could islands diffuse the acquainted with many of them. The principal worded not be acquainted with many of them. The principal worded you was that of Ceylon, called by the ancients Tapro-cients.

bane. The name was entirely unknown in Europe before the time of Alexander the Great; but that conqueror, though he did not visit, had some how or other heard of it; with regard to any particulars, however, he feems to have been very flenderly informed; and the accounts of ancient geographers concerning it are confused and contradictory. Strabo says, it is as large as Britain, and fituated at the diftance of feven days according to fome reports, or 20 days failing according to others, from the fouthern extremity of the peninfula. Pomponius Mela is uncertain whether to confider Taprobane as an island, or the beginning of another world; but inclines to the latter opinion, as nobody had ever failed round it. The account of Pliny is still more obscure; and by his description he would make us believe, that it was feated in the fouthern hemisphere beyond the tropic of Capricorn. Ptolemy places it opposite to Cape Comorin, at no great distance from the continent; but errs greatly with regard to its magnitude, making it no less than 15 degrees in length from north to fouth. And Agathemarus, who wrote after Ptolemy, makes Taprobane the largest island in the world, assigning the second place to Britain. From these discordant accounts, fome learned men have supposed that the Taprobane of the ancients is not Ceylon, as is generally believed, but the island of Sumatra; though the description of it by Ptolemy, with the figure delineated in his maps, feems to put it beyond a doubt, that Ceylon, and not Sumatra.

defignation of Taprobane. The other islands described by that geographer to the eastward of Taprobane, are, according to Dr Robertson, those called Andaman and

Nicobar in the gulf of Bengal.

Cofmas to India.

From the time of Ptolemy to that of the Emperor Justinian, we have no account of any intercourse of the Europeans with India, or of any progress made in the Voyages of geographical knowledge of the country. Under that emperor one Cosmas, an Egyptian merchant, made fome voyages to India, whence he acquired the furname of Indicopleufles. · Having afterwards turned monk, he published feveral works; one of which, named Christian Topography, has reached us. In this, though mixed with many firange reveries, he relates with great fimplicity and appearance of truth what he had feen in his travels or had learned from others. He deferibes feveral places on the western coast of the hither peninfula, which he calls the chief feat of the pepper-trade; and from one of the ports on that coast named Male, Dr Robertson thinks that the name Malabar may probably be derived, as well as that of Maldives given to a clufter of islands lying at no great distance. Cosmas informs us also, that in his time the island of Taprobane had become a great staple of trade. He supposed it to lie about half way betwixt the Persian Gulf and the country of the Sinæ; in confequence of which commodious fituation it received the filk of the Sinæ, and the precious spices of the remote regions of the east, which were from thence conveyed to all parts of India, Persia, and the Arabian Gulf. He calls it not Taprobane, but Sieldibia, derived from Sclendib, or Serendib, the fame by which it is still known all over the east. From him also we learn, that the Persians having overthrown the empire of the Parthians, applied them-felves with great diligence and fuccefs to maritime affairs; in consequence of which they became formidable rivals to the Romans in the India trade. The latter finding themselves thus in danger of losing entirely that lucrative branch, partly by reason of the rivalship just mentioned, and partly by reason of the frequent hostilities which took place betwixt the two empires, by means of his ally the emperor of Abyssinia. In this he was difappointed, though alterwards he ob-Silk worms tained his end in a way entirely unexpected. This was by means of two monks who had been employed as miffionaries in different parts of the east, and had penetrated as far as the country of the Seres or China, From thence, induced by the liberal promifes of Jultinian, they brought a quantity of the eggs of the filkworms in an hollow cane. They were then hatched by the mulberry, worked and multiplied as well as in and the fouthern, which he denominates Comar, from those countries of which they are natives. Valt numbers were foon reared in Greece; from whence they were exported to Sicily, and from thence to Italy; mentioned, explained by the commentary of another in all which countries filk-manufactures have fince been established.

rope.

On the conquest of Egypt by the Saracens in the Intercourfe of the Sara- year 640, the India trade was of course transferred to correspond with what is observed among them at this them; and they foon began to purfue it with much day. They take notice of the general use of filk more vigour than the Romans had done. The city among the Chincle; and the manufacture of porcelain, of Baffora was built by the Khalif Omar upon the which they compare to glass. They also describe the

Sumatra, is the island to which Ptolemy applies the of the Euphrates with the Tigris. Thus the com- India, mand of both rivers was fecured, and the new city foon became a place of fuch confequence as fearce to yield to Alexandria itself. Here Dr Robertson takes notice, that from the evidence of an Arabian merchant who wrote in the year 851, it appears, that not only the Saracens, but the Chinese also, were destitute of the Chinese igmariner's compass; contrary to the general opinion, norant of that this instrument was known in the east long before the use of it made its appearance in Europe. From this rela- the marition, as well as much concurring evidence, favs our an. ner's compthor, " it is manifest, that not only the Arabians but Pals. the Chinese were destitute of this faithful guide, and that their mode of navigation was not more adventurous than that of the Greeks and Romans. They fleered fervilely along the coast, feldom stretching out to fea fo far as to lofe fight of land; and as they shaped their course in this timid manner, their mode of reckoning was defective, and liable to the fame errors with that of the Greeks and Romans." Notwith-flanding this difadvantage, however, they penetrated far beyond Siam, which had fet bounds to the navigation of the Enropeans. They became acquainted with Sumatra and other India iflands; extending their navigation as far as the city of Canton in China. A regular commerce was now carried on from the Persian Gulf to all the countries lying betwixt it and China, and even with China itself. Many Saracens settled in India properly fo called, and in the countries beyond it. In the city of Canton particularly, they were to numerous, that the emperor permitted them to have a cadi or judge of their own religion; the Arabian language was understood and spoken in every place of confequence; and ships from China are even faid to have vifited the Perfian Gulf.

According to the Arabian accounts of those days, State of Inthe peninfula of India was at that time divided into dia when four kingdoms. The first was composed of the pro-visited by vinces fituated on the Indus and its branches, the ca-hians. pital of which was Moultan. The fecond had the city of Canoge, which, from the ruins of it remaining at this day, appears to have been a very large place. The Indian hiltorians relate, that it contained 30,000 shops in which betel-nut was fold, and 60,000 fets of muficians and fingers who paid a tax to government. The third kingdom was that of Cachemire, first mentioned by Maffoudi, who gives a flort defeription of it. The fourth kingdom, Guzerat, reprefented by the fame author as the most powerful of the whole. Another Arab writer, who flourished about the middle of the 14th century, dividas India into three parts; the northern, comprehending all the provinces on the Indus; the heat of a dunghill; and being fed with the leaves or the middle extending from Guzerat to the Ganges;

From the relation of the Arabian merchant above Arabian who had likewise visited the eastern parts of Afia, we learn many particulars concerning the inhabitants of these distant reigions at that time, which western banks of the great river formed by the union teaplant, with the manner of using its leaves; whence it:

appears, that in the ninth century the use of this plant in China was as common as it is at prefent. They mention likewife the great progrefs which the Indians had made in aftronomy; a circumftance which feems to have been unknown to the Greeks and Romans: they affert, that in this branch of fcience the Indians were far fuperior to the most enlightened nations of the west, on which account their sovereign was called the "King of wisdom." The surpersitions, extravagant penances, &c. known to exist at this day among the Indians, are also mentioned by those writers; all which particulars manifest that the Arabians had a knowledge of India far superior to that of the Greeks or Romans. The zeal and industry of the Mohammedans in exploring the most distant regions of the east was rivalled by the Christians of Persia, who The mutual antipathy which the Christians and Mofent missionaries all over India and the countries adhammedans bore against each other, would no doubt joining, as far as China itself. But while the western for a long time retard the progress of commerce between them; but at last the khalifs, perceiving A fratics thus kept up a constant intercourse with these parts, the Europeans had in a manner loft all know ledge of them. The port of Alexandria, from which the advantage which fuch a traffic would be of to they had formerly been supplied with the Indian goods, was now thut against them; and the Arabs, fatisfied with supplying the demands of their own subjects, neglected to fend any by the usual channels to the towns on the Mediterranean. The inhabitants of Constantinople and fome other great towns were fupplied with Chinese commodities by the most tedious and difficult paffage imaginable. The filk of that country was purchased in the most westerly province named Chenfi; from thence it was conveyed by a caravan, which marched 80 or 100 days, to the

tinople. It is evident that a commerce thus carried on must have been liable to a thousand disadvantages. The goods conveyed over fuch vaft tracts of land could not be fold but at a very high price, even supposing the journey had been attended with no danger; but as the caravans were continually exposed to the affaults of barbarians, it is evident that the price must on that account have been greatly enhanced. In spite of every difficulty, however, even this commerce flourished, and Conftantinople became a confiderable mart for East Indian commodities; and from it all the rest of Europe was chiefly fupplied with them for more than two centuries. The perpetual course of hostilities in which the Christians and Mohammedans were during this period engaged, contributed still to increase the difficulty; and it is remarkable, that the more this difficulty increased, the more desirous the Europeans crusaders, were flourishing cities inhabited by opulent feemed to be of possessing the luxuries of Asia.

banks of the Oxus. Here it was embarked, and car-

ried down the river to the Caspian sea; whence, after a dangerous voyage across that sea, it was carried up

the river Cyrus as far as that river is navigable; after

which it was conducted by a land-carriage of five days

to the river Phasis, then down that stream into

the Euxine, and thence to Constantinople. The pas-

fage of goods from Hindoftan was less tedious; they

being carried either directly to the Caspian or to the

giver Oxus, but by a paffage much flurter than that

from China: after which they were conveyed down

the Phasis to the Euxine, and thus to Constan-

About this time the cities of Amalphi and Venice, Mediterranean with the productions of the east; and, with fome others in Italy, having acquired a greater as far as can be gathered from incidental occurrences No 185.

degree of independence than they formerly possessed, India, began first to exert themselves in promoting domestic manufactures, and then to import the productions of India in much larger quantities than formerly Some traces of this revival of a commercial spirit, according to Dr Robertson, may be observed from the end of the feventh century The circumstances which led to this revival, however, are entirely unnoticed by historians; but during the feventh and eighth centuries, it is very probable that no commercial intercourse whatever took place betwixt Italy and Alexandria; for, prior to the period we fpeak of, all the public deeds of the Italian and other cities of Europe had been written upon paper made of the Egyptian papyrus, but after that upon parchment.

their fubjects, were induced to allow it, while the eagerness with which the Christians coveted the Indian products and manufactures, prompted them to carry it on. But icarce was the traffic begun, when Effect of it feemed in danger of being totally interrupted by the the Crucrusades. Notwithstanding the enthusiastical zeal of the Indian these adventurers, however, there were many to whom commerces commerce was a greater object than religion. This had always been the case with numbers of the pilgrims who visited the holy places at Jerusalem even before the commencement of the crufades : but thefe, after they took place, instead of retarding the progress of this kind of commerce, proved the means of promoting it to a great degree. "Various circumflances (fays Dr Robertfon) concurred towards this. Great armies, conducted by the most illustrious nobles of Europe, and composed of men of the most enterprising spirit in all the king. doms of it, marched towards Palestine, through countries far advanced beyond those which they left in every species of improvement. They beheld the dawn of prosperity in the republics of Italy, which had begun to vie with each other in the arts of industry, and in their efforts to engross the lucrative commerce with the east. They next admired the more advanced state of opulence and splendor in Constantinople, raised to a pre-eminence above all cities then known by its extenfive trade, particularly that which it carried on with India and the countries beyond it. They afterwards ferved in those provinces of Asia through which the commodities of the east were usually conveyed, and became mafters of feveral cities which had been staples of that trade. They established the kingdom of Jerusalem, which subsisted near 200 years. poslession of the throne of the Greek empire, and governed it above half a century Amidst such a variety of events and operations, the ideas of the fierce warriors of Europe gradually opened and improved; they became acquainted with the policy and arts of the people whom they subdued: they observed the sources of their wealth, and availed themselves of all this knowledge. Antioch and Tyre, when conquered by the merchants, who supplied all the nations trading in the

mentioned

28 Tedious paffage of Indian goods to Europe.

mentioned by the historians of the holy war, who being mostly priests and monks, had their attention directed to objects very different from those relating to commerce, there is reason to believe, that both in Constantinople while subject to the Franks, and in the ports of Syria acquired by the Christians, the longeflablished trade with the east continued to be protected and encouraged."

Our author next goes on to show in what manner the commerce of the Italian states was promoted by the Crusades, until at last, having entirely engrossed the East India trade, they strove with fuch eagerness to find new markets for their commodities, that they extended a tafte for them to many parts of Europe where they had formerly been little known. The rivallhip of the Italian flates terminated at last in a treaty with the fultan of Egypt in 1425, by which the port of Alexandria and others in Egypt were opened to the Florentines as well as the Venetians; and foon after, that people began to obtain a share in the trade

carried on

The following account of the manner in which the India trade was carried on in the beginning of the 14th century, is given by Marino Sanudo a Venetian nobleman. The merchants of that republic were supplied in the 14th with the commodities they wanted in two different ways. Those of small bulk and great value, such as cloves, nutmegs, gems, pearls, &c. were carried up the Persian gulf to Bassora, from thence to Bagdad, and afterwards to some port on the Mediterranean. The more bulky goods, fuch as pepper, cinnamon, and other spiceries, were brought in the usual manner to the Red Sea, and from thence to Alexandria. The goods brought by land, however, were always liable to be feized by barbarians; and therefore the fupply that way was fcanty, and the price extravagantly dear, while, on the other hand, the Sultan of Egypt, by imposing duties upon the East India cargoes to the amount of a full third of the value, feemed to render it impossible that the owners should find purchasers for their goods. This, however, was far from being the case; the demand for India goods continually increased; and thus a communication, formerly unknown, betwixt all the nations of Europe, was begun and kept up. All this time, however, there had been no direct communication betwixt Europe and India, as the Mohammedans would never allow any Christian to pass through their dominions into that country. The dreadful incursions and conquelts of the Tartars under Jenghiz-khan, however, had so broken the power of the Mohammedans in the northern parts of Afia, that a way was now opened to India through the dominions of these barbarians. About the middle of the 13th century, therefore, Marco Polo, a Venetian, by getting access to the khan of the Tartars, explored many parts of the East which had long been unknown even by name to the Europeans. He travelled through China from Peking on its northern frontier to fome of its most foutherly provinces. He vifited also different parts of Hindostan, and first mentions Bengal and Guzerat by their modern names as great and flourishing kingdoms. He obtained also some account of an island which he called Zitangri, and was probably no other than Japan : he vifited Java with feveral of the iflands in its neigbourhood, the island of Ceylon, and the coast of Malabar we are to conclude that the profits of such money as Vol. IX. Part I.

as far as the gulf of Cambay; to all which he gave the India. names they have at this day. The discovery of such immense regions unknown before in Europe, furnished vaft room for speculation and conjecture; and while the public attention was yet engaged by these discoveries, the destruction of Constantinople by the Turks Genoese gave a very confiderable turn to the East India com-trade to India ruing merce, by throwing it almost entirely into the hands ed by the of the Venetians. Hitherto the Genoese had rivalled taking of that state in the commerce we speak of, and they had Constantipossessed themselves of many important places on the nople. coast of Greece, as well as of the port of Cassa on the Black Sea. Nav. they had even established themselves at Constantinople, in the suburb of Pera, in such a manner as almost entirely to exclude the Greeks themfelves from any share in this commerce: but by the destruction of Constantinople they were at once driven out of all these possessions, and so thoroughy humbled, that they could no longer contend with the Venetians as before; fo that, during the latter part of the 15th century, that republic supplied the greater part of Europe with the productions of the east, and carried on trade to an extent far beyond what had been known in former times. The mode in which they now carried on this trade was fomewhat different from what had been practifed by ancient nations. The Tyrians, Greeks, and Romans, had failed directly to India in quest of the commodities they wanted; and their example has been imitated by the navigators of modern Europe. In both periods the Indian commodities have been paid for in gold and filver; and great complaints have been made on account of the drain of those precious metals, which were thus buried as it were in India, never to return again. The Vene-tians, however, were exempted from this lofs; for ha-mmente ving no direct intercourse with India, they supplied the Venethemselves from the warehouses they found, in Egypt tians arising and Syria, ready filled with the precious commo-from their dities they wanted; and these they purchased more commerce. frequently by barter than with ready money. Thus not only the republic of Venice, but all the cities which had the good fortune to become emporia for the India goods imported by it, were raifed to fuch a pitch of power and splendor as scarce ever belonged to any European state. The citizens of Bruges, from which place the other European nations were for a long time fupplied with these goods, displayed such magnificence in their drefs, buildings, and manner of living, as excited even the envy of their queen Joan of Navarre who came to pay them a vifit. On the removal of the staple from Bruges to Antwerp, the latter foon displayed the same opulence; and in some cities of Germany, particularly Augsburg, the great mart for Indian commodities in the internal parts of that country, there are examples of merchants acquiring fuch large fortunes as intitled them to high rank and confideration in the empire. The most accurate method. however, of attaining fome knowledge of the profits

the Venetians had on their trade, is by confidering the rate of interest on money borrowed at that time. This, from the close of the 11th century to the com- High intemencement of the 16th, we are told, was no less than rest of more in the 20 per cent. and fometimes more. Even as late as 15th cen-1500, it was 10 or 12 in every part of Europe. Hencetury.

Journey of Polo into the Eaft.

India. was then applied in trade must have been extremely high; and the condition of the inhabitants of Venice at that time warrants us to make the conclusion. " In the magnificence of their houses (fays Dr Robertson), in richness of furniture, in profusion of plate, and in every thing which contributed either towards elegance or parade in their mode of living, the nobles of Venice furpassed the state of the greatest monarch beyond the Alps. Nor was all this difplay the effect of an oftentatious and inconfiderate diffipation; it was the natural confequence of fuccessful industry, which, having accumulated wealth with eafe, is intitled to enjoy

it in fplendor." This exceffive fuperiority of wealth displayed by the Venetians could not fail to excite the envy of the other flates of Europe. They were at no loss to discover that the East India trade was the principal fource from whence their wealth was derived. Some of them endeavoured to obtain a share by applying to the sultans of Egypt and Syria to gain admission into their ports upon the fame terms with the Venetians; but either by the superior interest of the latter with those princes, or from the advantages they had of being long established in the trade, the Venetians always prevailed. So intent indeed were the other European powers in obtaining fome share of this lucrative commerce, that application was made to the fovereign of Russia to open an intercourse by land with China, though the capitals of the two empires are upwards of 6000 miles distant from each other. This, however, was beyond the power of the Ruffian prince at that time; and the Venetians imagined that their power and wealth were fully established on the most permanent basis, when two events, altogether unforeseen and unexpected, gave it a mortal blow, from which it never has recovered, or can recover itself. These were the discovery of America and that of the passage to the East Indies by the Cape of Good Hope. The former put Spain in possession of immense treasures; which very of the being gradually diffused all over Europe, soon called forth the industry of other nations, and made them exert themselves in such a manner as of itself must have foon leffened the demand for Indian productions. The discovery of the passage to India by the Cape of Good Hope, however, was the most effectual and fpeedy in humbling the Venetians. After a tedious course of voyages along the western coast of Africa, continued for near half a century, Vasco de Gama, an active and enterprifing Portuguese officer, doubled the Cape of Good Hope, and, coasting along the eastern fhore of the continent, failed next across the Indian ocean, and landed at Calecut on the coaft of Malabar, on the 22d of May 1498, ten months and two days after leaving the port of Lifbon. On his arrival in India he was at first received with great kindness by the fovereign of that country, ftyled the Samorin; but afterwards, from what causes we cannot now well determine, the Indian prince fuddenly changed his kindpels into mortal enmity, and attempted to cut off Gama with his whole party. The Portuguese general, however, found means to escape every plot that was laid against him; and loaded his ships not only with the products of that part of the country, but with many of the valuable products of the more remote regions.

Portuguese nation, nay all the nations in Europe, the Venetians alone excepted, rejoiced at the discovery Exploits of which had been made. The latter beheld in it the the Portucertain and unavoidable downfal of their own pow-guese in er; while the Portuguese, presuming upon their right of India. prior discovery, which they took care to have confirmed by a papal grant, plumed themselves on the thoughts of having the whole Indian commerce centre in their nation. The expectations of the one, and the apprehenfions of the other, feemed at first to be wellfounded. A fuccession of gallant officers fent into the east from Portugal accomplished the greatest and most arduous undertakings. In 24 years after the voyage of De Gama, they had made themselves masters of many important places in India; and among the reft of the city of Malacca, where the great staple of trade throughout the whole East Indies was established. As this city stands nearly at an equal distance from the eaftern and western extremities of all the countries comprehended under the name of Indies, it was frequented by the merchants of China, Japan, of all the kingdoms on the continent, the Moluccas and other islands in that quarter, as well as by those of Malabar, Ceylon, Coromandel, and Bengal. Thus the Portuguefe acquired a most extensive influence over the internal commerce of India; while, by the fettlements they had formed at Goa and Diu, they were enabled to engrofs the trade on the Malabar coaft, and greatly to obstruct. the long established intercourse of Egypt with India by the way of the Red Sea. Their thips now frequented every port in the east where any valuable commodities. were to be had, from the cape of Good Hope to the river of Canton in China; and all along this immenfe extent, of more than 4000 leagues, they had a chain of forts and factories established for the convenience of protecting their trade. They had likewife made themfelves matters of feveral stations favourable to commerce along the fouthern coast of Africa, and in many iflands lying between Madagafcar and the Moluccas. In all places where they came, their arms had ftruck fuch terror, that they not only carried on their trade without any rival or control, but even prescribed to the natives the terms of their mutual intercourse ; nay, fometimes they fet what price they pleafed upon the commodities they purchased, and thus were enabled to import into Europe the Indian commodities in greater abundance and at a lower rate than had ever been done before. Not fatisfied with this, they formed a scheme of excluding all other nations from any share of the trade they enjoyed; and for that purpose determined to make themselves masters of such stations on the Red Sea and Persian Gulf as might put them in possession of the navigation of both these seas, and enable them not only to obstruct the ancient commerce between Egypt and India, but to command the mouths of the great rivers which we have formerly mentioned as the means of conveying the Indian goods through the internal parts of Afia. The conduct of these enterprises was committed to Alphonso Albuquerque, the most distinguished officer at that time in the Portuguese service. By reason of the valt number of the enemies he had to contend with, however, and the fcanty fupplies which could be derived from Por-On his return to Portugal, De Gama was received tugal, he could not fully accomplish what was expected from

ffairs.

from him. However, he took from the petty princes who were tributaries to the kings of Perfia the fmall Island of Ormus, which commanded the mouth of the Persian Gulf; and thus secured to Portugal the possession of that extensive trade with the east which the Persians had carried on for feveral centuries. On this barren island, almost entirely covered with falt, and so hot that the climate can scarcely be borne, destitute of a drop of fresh water, except what was brought from the continent, a city was erected by the Portuguese, which foon became one of the chief feats of opulence, fplendor, and luxury, in the eastern world. In the Red Sea the Arabian princes made a much more formidable refistance; and this, together with the damage his fleet fustained in that sea, the navigation of which is always difficult and dangerous, obliged Albuquerque to retire without effecting any thing of importance. Thus the ancient channel of conveyance still remained open to the Egyptians; but their commerce was greatly circumferibed and obstructed by the powerful interest of the Portuguese in every port to

which they had been accustomed to refort. The Venetians now began to feel those effects of De Gama's discovery which they had dreaded from ruggles of the beginning. To preserve the remains of their commerce, they applied to the fultan of the Mameluks in Egypt, who was no lefs alarmed than themfelves at rieve their the loss of such a capital branch of his revenue as he had been accustomed to derive from the India trade. By them this fierce and barbarous prince was eafily perfuaded to fend a furious manifesto to Pope Julius II. and Emmanuel king of Portugal. In this, after stating his exclusive right to the Indian trade, he informed them, that if the Portuguese did not relinquish that new course of navigation by which they had penetrated into the Indian ocean, and ceafe from encroaching on that commerce which from time immemorial had been carried on between the east of Asia and his dominions, he would put to death all the Christians in Egypt, Syria and Palestine, and demolish the holy fepulchre itself. To this threat, which some centuries before would have alarmed all Christendom, no regard was paid; fo that the Venetians, as their last refource, were obliged to have recourse to a different expedient. This was to excite the fultan to fit out a fleet in the Red Sea to attack the Portuguese, and drive them from all their fettlements in the east; nay, in order to affift him in the enterprife, he was allowed to cut down their forests in Dalmatia, to supply the deficiency of Egypt in timber forship-building. The timber was conveved from Dalmatia to Alexandria; and from thence, partly by water and partly by land, to Suez ; where twelve men of war were built, on board which a body of Mameluks were ordered to ferve under the command of an experienced officer. Thus the Portuguefe were affaulted by a new enemy far more formidable than any they had yet encountered; yet fuch was the valour and conduct of the admiral, that after feveral fevere engagements, the fleet of the infidels was entirely ruined, and the Portuguese became absolute masters of the Indian ocean.

This difafter was followed in no long time by the total overthrow of the dominion of the Mameluks in Egypt by Selim the Turkish fultan; who thus also became mafter of Syria and Palestine. As his interest fince in the hands of those two nations.

was now the same with that of the Venetians, a league was quickly formed betwixt them for the ruin of the power of the Portuguefe in India, With this view Selim confirmed to the Venetians the extensive commercial privileges they enjoyed under the government of the Mameluks; publishing at the same time an edict, by which he permitted the free entry of all the productions of the east imported directly from Alexandria into any part of his dominions, but imposed heavy taxes upon fuch as were imported from Lifbon. All this, however, was infufficient to counteract the great advantages which the Portuguese had obtained by the new paffage to India, and the fettlements they had established in that country : at the same time that the power of the Venetians being entirely broken by the league of Cambray, they were no longer able to contribute any affidance. They were therefore reduced to the necessity of making an offer to the king of Portugal to purchase all the spices imported into Lisbon. over and above what might be requisite for the confumption of his own subjects. This offer being rejected, the Portuguese for some time remained uncontrolled masters of the Indian trade, and all Europe was supplied by them, excepting some very inconsiderable quantity which was imported by the Venetians through the usual channels. The Portuguese continued to enjoy this valuable Why the

branch of commerce unditturbed almost for a whole Portuguese century; to which, however, they were indebted more trade was

to the political fituation of the different European na-rupled by tions than to their own prowefs. After the accession other Euof Charles V. to the throne of Spain, that Kingdom was ropean either fo much engaged in a multiplicity of operations, powers. owing to the ambition of that monarch and his fon Philip II. or fo intent on profecuting the discoveries and conquefts in the new world, that no effort was made to interfere with the East India trade of the Portuguele, even though an opportunity offered by the discovery of a second passage by sea to the East Indies through the straits of Magellan. By the acquisition of the crown of Portugal in 1580, Spain, instead of becoming the rival, became the protector and guardian of the Portuguele trade. The refources of France all this time were fo much exhausted by a continuance of long and defolating wars, that it could bestow neither much attention on objects at fuch a diffance, nor engage in any expensive scheme. England was desolated by the ruinous wars between the houses of York and Lancaster; and afterwards its enterprising spirit was restrained by the cautious and covetous Henry VII. His fon Henry VIII. in the former part of his reign. by en gaging in the continental quarrels of the European princes, and in the latter part by his quarrel with the pope and contests about religion, left no time for commercial schemes. It was not therefore till the reign of Queen Elizabeth that any attention was paid to the affairs of the East by that kingdom. The first who shook the power of the Portuguese in India were the Dutch; and in this they were gladly feconded by the natives, whom the Portuguese had most grievoully oppressed. The English soon followed their example; and in a few years the Portuguese were expelled from their most valuable settlements, while the most lucrative branches of their trade have continued ever

India. It is not to be supposed that the other European he was encouraged by Dupleix and Chunda Saib, who Rivalthip of the

Indies.

great rivalship commenced; nor did this fully difplay itself till after the peace of Aix la Chapelle. Both nations had by this time made themselves ma-English set sters of considerable settlements in India. The principal of those belonging to Britain were, 1. Surat, fituated on the western side of the peninsula within the Ganges, between the 21st and 22d degrees of N. Lat. This peninfula comprehended the kingdoms of Malabar, Decan, Golconda, and Bifnagar, with the principalities of Gingi, Tanjour, and Madura; the western coast being distinguished by the name of Malabar, and the eastern by that of Coromandel. 2. Bombay, a fmall island in the kingdom of Decan, about 45 leagues to the fouth of Surat. 3. Dabul, about 40 leagues farther to the fouth, in the province of Cuncan. 4. Carwar, in N. Lat. 150, where there was a fmall fort and factory. 5. Tillicherry, to which place the English trade was removed from Calecut, a large town 15 leagues to the fouthward. 6. Anjengo, between eight and nine degrees of latitude, the most foutherly fettlement on the western coast of the peninfula. 7. On the Coromandel coast they possessed Fort St David's, formerly called Tegapatan, fituated in the kingdom of Gingi, in 11° 40' N. Lat. 8. Madras, the principal fettlement on this coast, between 13° and 14° N. Lat. not far from the diamond mines of Golconda. o. Vifigapatam, farther to the north. 10. Balafore, in latitude 220, a factory of small consequence. II. Calcutta, the capital of all the British settlements in the East Indies. These were the principal places belonging to Britain which we shall have occasion to mention in the account of the contests which now took place; those of the French were chiefly Pondichery and Chandernagore. The war is faid to have been first occasioned by the

French and to fow diffension among the nabobs, who had by this English in time usurped the fovereignty of the country. Nizam Almuluck, viceroy of Decan, and nabob of Arcot, had, as officer for the Mogul, nominated Anaverdy Khan to be governor of the Carnatic, in the year 1745. On the death of Nizam, his fecond fon Nazir-zing was appointed to fucceed him in his viceroyalty, and his nomination was confirmed by the Mogul. He was opposed by his coufin Muzaphier zing, who applied to Dupleix for affistance. By him he was supplied with a body of Europeans and fome artillery; after which, being alfo joined by Chunda Saib, an active Indian prince, he took the field against Nazir zing. The latter was supported by a body of British troops under Colonel Laurence; and the French, dreading the event of an engagement, retired in the night; fo that their ally was obliged to throw himfelf on the clemency of Nazarzing. His life was fpared, though he himself was detained as a state prisoner: but the traitor, forgetting the kindness showed him on this occasion, entered into a conspiracy against the life of Nazir-zing, and murdered him in his camp; in which infamous transaction

nations would fit still and quietly fee these two en- had retired to Pondicherry. Immense riches were gross the whole of this lucrative commerce without at- found in the tents of Nazir zing, great part of which tempting to put in for a share. East India compa- fell to the share of Dupleix, whom Muzapher-zing now and formalities of an eastern prince; and he and his colleague Muzapher-zing appointed Chunda Saib nabob of Arcot. In 1749, Anaverdy Khan had been defeated and killed by Muzapher-zing and Chunda Saib, affifted by the French; after which his fon Mohammed Ali Khan had put himself under the protection of the English at Madras, and was confirmed by Nazir-zing as his father's fuccessor in the nabobship or government of Arcot. This government therefore was disputed betwixt Mohammed Ali Khan, appointed by the legal viceroy Nazir zing, and supported by the English company, and Chunda Saib nominated by the usurper Muzapher zing, and protected by Dupleix, who commanded at Pondicherry. Muzapher-zing, however, did not long enjoy his ill got authority; for in the year 1751, the nabobs who had been the means of railing him to the power he enjoyed, thinking themfelves ill rewarded for their fervices, fell upon him fuddenly, defeated his forces, and put him to death; proclaiming Salabat-zing next day viceroy of the Deccan. On the other hand, the Mogul appointed Gauzedy Khan, the elder brother of Salabat zing; who was confirmed by Mohammed Ali Khan in the government of Arcot: but the affairs of the Mogul were at that time in fuch diforder, that he could not with an army fupport the nomination he had made. Chunda Saib in the mean time determined to recover by force the nabobship of Arcot, from which he had been deposed by the Mogul, who had placed Anaverdy Khan in his room. With this view he had recourse to Dupleix at Pondicherry, who reinforced him with 2000 Sepoys, 60 Caffrees, and 420 French; upon condition that if he fucceeded, he should cede to the French the town of Velur in the neighbourhood of Pondicherry, with its dependencies, confifting of 45 villages. Thus reinforced, he defeated Anaverdy Khan who loft his life in the engagement, reaffumed the government of Arcot, and punctually performed the engagements he had come under to his French allies.

All this time Mohammed Ali Khan had been fupported by the English, to whom he fled after his father's death. By them he was supplied with a reinforcement of men, money, and ammunition, under the conduct of Major Laurence, a brave and experienced officer. By means of this fupply he gained fome advantages over the enemy; and repairing afterwards to Fort St David's, he obtained a farther reinforcement. With all this affiltance, however, he accomplished nothing of any moment; and the English auxiliaries having retired, he was defeated by his enemies. Thus he was obliged to enter into a more close alliance with the English, and cede to them some commercial points which had been long in dispute; after which, Captain Cope was dispatched to put Trinchinopoli in a state of defence, while captain de Gingis, a Swifs officer, marched at the head of 400 Europeans to the affift- Mr Clive's ance of the nabob. India.

little qualified for that or any other department in civil life. He now marched towards Arcot at the head of 210 Europeans and 500 Sepoys. In his first expedition he displayed at once the qualities of a great commander. His movements were conducted with fuch fecreey and dispatch, that he made himself mafter of the enemy's capital before they knew of his march; and gained the affections of the people by his generofity, in affording protection without ranfom. His brave-In a fhort time, however, he found himself invested in ry and fuc- Fort St David's by Rajah Saib, fon to Chunda Saib, an Indian chief, pretender to the nabobship of Arcot, at the head of a numerous army; the operations of the fiege being conducted by European engineers. Thus, in fpite of his utmost efforts, two practidable breaches were made, and a general affault given; but Mr Clive having got intelligence of the intended attack, defended himfelf with fuch vigour, that the affailants were every where repulfed with lofs, and obliged to raife the fiege with the greatest precipitation. Not contented with this advantage, Mr Clive, being reinforced by a detachment from Trinchinopoli, marched in quest of the enemy; and having overtaken

> feated them on the 3d of December 1751. This victory was followed by the furrender of the forts of Timery, Conjaveram, and Arani; after which Mr Clive returned in triumph to Fort St David's. In the beginning of the year 1752 he marched towards Madras, where he was reinforced by a fmall body of troops from Bengal. Though the whole did not exceed 300 Europeans, with as many natives as were fufficient to give the appearance of an army, he boldly proceeded to a place called Koveripauk, about 15 miles from Arcot, where the enemy lay to the number of 1500 Sepoys, 1700 horfe, with 150 Europeans, and eight pieces of cannon. Victory was long doubtful, until Mr Clive having fent round a detachment to fall upon the rear of the enemy while the English attacked the entrenchments in front with their bayonets, a general confusion enfued, the enemy were routed with confiderable flaughter, and only faved from total destruction by the darkness of the night. The French to a man threw down their arms, and furrendered themselves prisoners of war; all the baggage and cannon falling at the same time into the hands of the

them in the plains of Arani, attacked and entirely de-

victors.

His exploits jor Laurence.

Death of

Chunda

Saib.

On the return of Mr Clive to Fort St David's, he under ma- was superseded in the command by Major Laurence. By him he was detached with 400 Europeans, a few Mahratta soldiers, and a body of Sepoys, to cut off the enemy's retreat to Pondicherry. In this enterprife he was attended with his usual good success, took ieveral forts, vanquished the French commander M. d'Anteuil, and obliged him with all his party to fur-

render prisoners of war.

Chunda Saib, in the mean time, lay encamped with an army of 30,000 men at Syringham, an island in the neighbourhood of Trinchinopoli; but Major Lawrence having found means to intercept his provisions, he was obliged to fly. Being obliged to pass through the camp of the Tanjore general, he obtained a pais for the purpose; but was nevertheless detained by the nabob; who was an ally of the English, and his head was ftruck off, in order to prevent any disputes that Inlia. might arise concerning him.

After the flight of Chunda Saib, his army was attacked and routed by Major Lawrence; and the island of Syringham furrendered, with about 1000 French foldiers under the command of Mr Law, brother to him who schemed the Missippi company. M. Dupleix, exceedingly mortified at this bad fuccefs, proclaimed M. Dupleix Rajah Saib, fon to Chunda Saib, nabob of Arcot; pretends and afterwards produced forged commissions from the figns from Great Mogul, appointing him governor of all the Car-the Mogul. natic from the river Kriftnah to the fea. The better and aff to to carry on this deception, a mcffenger pretended to the flate of come from Delhi, and was received with all the pomp an Indian of an amballador, from the Great Maril 12 of an ambaffador from the Great Mogul. Dupleix. mounted on an elephant, and preceded by music and dancing women, after the oriental fashion, received his commission from the hands of this impostor; after which he affected the flate of an caltern prince, kept his durbar or court, appeared fitting crofs legged on a fopha, and received prefents, as fovereign of the country, from his own council as well as from the na-

Thus the forces of the English and French East India companies were engaged in a course of hostilities at a time when no war exilted between the twonations; and while they thus continued to make war upon each other under the title of auxiliaries to the contending parties, Gauzedy Khan took poffession of the dignity appointed him by the Mogul; but had not been in possession of it above 14 days when he was poisoned by his own fifter. His fon Scah Abadin Khan was appointed to fucceed him by the Mogul; but the latter being unable to give him proper affiltance, Salabat-zing remained without any rival, and made a prefent to the French commander of all the English pos-

fessions to the northward.

Thus concluded the campaign of 1752. Next year 47 both parties received confiderable reinforcements; the Reinforce months are English, by the arrival of Admiral Watson with a rive from fquadron of ships of war, having on board a regiment England commanded by Colonel Aldercroon; and the French and France, by M. Gadeheu, commissary and governor-general of all their fettlements, on whose arrival M. Dupleix de-parted for Europe. The new governor made the most friendly propofals; and defired a ceffation of arms until the disputes could be adjusted in Europe. These proposals being readily listened to on the part of the English, deputies were sent to Pondicherry, and a provisional treaty and truce were concluded, on con-provisional dition that neither of the two companies should for treaty be the future interfere in any of the differences that might twist the take place in the country. The other articles related two nations conto the places or fettlements that should be retained or cluded. possessed by the respective companies, until fresh orders should arrive from the courts of London and Verfailles; and till then it was ftipulated, that neither of the two nations should be allowed to procure any new grant or cession, or to build forts in defence of any new establishment; nor should they proceed to any cession, retrocession, or evacuation, of what they then poffeffed; but every thing should remain on the fame footing as formerly.

The treaty was published on the 11th of January.

1755; at the end of which month admiral Watfon returned with his foundron from Bombay, and M. Go-

deheu returned to France in the beginning of February, leaving M. Leyrit his fucceffor at Pondicherry. M. Buffy, with the Soubahdar Salabat-zing, commanded in the north; and M. de Saussay was left to command the troops at Siringham. Matters, however, did not long continue in a flate of tranquillity. Early in the year it appeared that the French were endeavouring to get possession of all the provinces of the Deccan. M. Buffy demanded the fortress of Golconda from Salabat-zing; and M. Leyrit encouraged the phousder or governor who rented Velu to take up arms against the nabob. He even fent 300 French and as many sepoys from Pondicherry to support this rebel, and oppose the English employed by the nabob to collect his revenues from the tributary princes. In this office they had been employed ever fince the ceffation of hostilities; one half of the revenue being paid to the nabob, and the other to the company, which now involved them in a kind of military expedition

into the country of the Polygars, who had been previously fummoned to fend agents to fettle accounts of the En glish into with the nabob. Four of them obeyed the summons; the country but one Lachenaig refused, and it was therefore resolved of the Poly- to attack him. The country was very strong, being almost entirely fortified by nature or art; for it was furrounded by craggy hills detached from one another, and covered with bushes so as to be impassable for any but the natives, who had thrown up works from hill to hill. Thefe works were indeed very rude, being formed of large stones laid upon one another without any cement, and flanked at proper diffances by round earthen towers; before the wall was a deep and broad ditch, with a large hedge of bamboes in front, fo thick that it could not be penetrated but by the hatchet or by the fire. This was forced, though not without fome lofs; after which another work of the

fame kind, but stronger, made its appearance; but this

being likewife forced, Lachenaig was obliged to fub-

mit and pay his tribute. The English army now marched to Madura, a strong Madura Madura Indian town about 60 miles fouth of Trinchinopoli. On reduced. their approach it fubmitted without any opposition, and the inhabitants feemed pleafed with their change 51 of government. Here a deputation was received from Two new a neighbouring polygar, defiring an alliance, and as a

fettlements. obtained by the English.

gars.

proof of his fincerity making an offer of two fettlements on the fea-coast of his country opposite to the island of Ceylon, which would greatly facilitate their future commerce with Tinivelly. Before this time they could not have reached that city but by a circuitous march of 400 or 500 miles; but from the new fettlements the diffance to Tinivelly was no more than 50 miles, and reinforcements or supplies of any kind might be fent them from Madras or Fort St David Exploits of in four or five days. This offer being accepted, Colonel Heron, the English commander, marched to attack the governor of Madura, who had fled to a place called Coilgoody: on the approach of the English he fled from this place also, leaving the greatest part of his troops to defend the place. The road was fo rugged, that the carriages of the cannon broke down; and as the troops were not furnished with scaling ladders, there was very firong. The colonel, however, determined India. to make an affault after the Indian manner, by burning down the gates with bundles of ftraw : and to encourage his men in this new method of attack, he himfelf carried the first torch, being followed by Mohammed Islouf, who bore the fecond. The place was ta- His impruken and plundered, not sparing even the temples; dence in ken and plundered, not iparing even the temples; plundering which infpired the inhabitants with the utmost abhor-the Indian rence of the victors on account of their contempt of temples. their religion.

After this exploit the army returned to Madura: and a garrison being left in the place, they proceeded to Tinivelly, which submitted without opposition, and owned the jurisdiction of the nabob; though some of the Polygars still evaded payment, and therefore hosti-

lities were commenced against them. The new expedition was marked by an act of the Cruel mafmost disgraceful cruelty at a fort named Nellecotah, sacre at 40 miles fouth of Tinenelly. It was fortified by a mud Nellecotahawall with round towers. The affault was made with great resolution, and the troops gained possession of the parapet without being repulfed. On this the garrison called out for quarter, but it was barbarously refused; a general massacre of men, women, and chil-

dren enfued, only fix perfons out of 400 being fuffered to escape with life.

It now appeared that the revenues collected in this expedition had not been fufficient to defray the expences of the army; and a report being fpread that Salabat-zing was advancing into the Carnatic at the head of his army, along with M. Buffy the French commander, to demand the Mogul's tribute, it was thought proper to recal Colonel Heron to Trinchinopoli. Before this, he had been prevailed on by the Indian chief who accompanied him, to convey to him (Mazuphe Cawn) an investiture of the countries of Madura and Tinevelly for an annual rent of 187,500l. fterling. In his way he was likewife induced by the fame chief to make an attempt on a strong fort named Nellytangaville, fituated about 30 miles west of Tinevelly, and belonging to a refractory Polygar. This attempt, however, proving unfuccefsful for want of battering cannon, the colonel returned with Mazuphe Cawn to Trinchinopoli, where he arrived on the 22d of May 1755.

The last expedition of this commander was against Unfortua mud fort named Volfynatam, fituated near the en. nate expetrance of the woods belonging to the Colleries. These dition and people were highly incensed at the plundering of Coil-ingrace of colonel goody, and particularly at the lofs of their facred Heronimages which the rapacious conquerors had carried off. In confequence of this they had already flaughtered a party of fepoys whom the commanding officer at Madura had fent out to collect cattle. In their march the English army had to go through the pass of Natam, one of the most dangerous in the peninsula. It begins about 20 miles north of Trinchinopoli, and continues for lix miles through a wood impassable to Europeans. The road which lay through it was barely fufficient to admit a fingle carriage at a time, at the fame time that a bank running along each fide rendered it impossible to widen it. In most places the wood was quite contiguous to the road; and even where part of it had been felled, the eye could not penetrate above 20 yards .- A detachment of Europeans, pioneers, and

fepoys,

Heron.

India.

The former met with no opposition, nor did any enemy appear against the latter for a long time. At last the march was stopped by one of the heaviest tumbrils flicking in a flough, out of which the oxen were not able to draw it. The officers of artillery fuffered the troops marching before to proceed; and the officer who commanded in the rear of the battalion, not fufpecting what had happened, continued his march. while most of the sepoys who marched behind the rear division of the artillery were likewife suffered to pass the carriage in the flough, which choaked up the road, and prevented the other tumbrils from moving forward. as well as three field pieces that formed the rear divifion of artillery, and the whole line of baggage that followed. In this divided and defenceless state the rear division of the baggage was attacked by the Indians: and the whole would certainly have been destroyed, had it not been for the courage and activity of Capt. Smith. who here commanded 40 Caffres and 200 fenovs, with one fix-pounder. Confiderable damage, however, was done, and the Indians recovered their gods; which certainly were not worth the carrying off, being only made of brafs, and of a diminutive fize. - Colonel Heron was tried by a court-martial for misconduct in this expedition; and being found guilty, was declared incapable of ferving the company any longer: foon after which he returned to Europe, and died in Holland.

In the mean time Nanderauze, an Indian prince, formed a scheme to get possession of Trinchinopoli; and in order to compass his end with greater facility, communicated his design to M. de Saussav the commander of the French troops. But this gentleman having communicated intelligence to the English commander, the enterprize miscarried, and no difference betwixt thefe two rival nations as yet took place. It does not however appear that the English were in the least more folicitous to avoid hostilities than the French: for as foon as the company were informed of the acquifitions made by M. Buffy in the Deccan, it was determined to encourage the Mahrattas to attack Salabat-zing, in order to oblige him to difmifs the French auxiliaries from his fervice .- In order to fucceed in this enterprife, it was necessary to have a commander well experienced in the political fystems of the country, as well as ip military affairs; and for this purpose Mr Clive, now governor of Fort St David's, and invefted with a lieutenant-colonel's commission in the king's troops, offered his fervice. Three companies of the king's artillery, confifting of 100 men each, and 300 recruits, were fent from England on this expedition. who arrived at Bombay on the 27th of November; when on a fudden the prefidency of Madras took it into confideration that this expedition could not be profecuted without infringing the convention made with the French commander. "This (fays Mr Grofe) was acting with too much caution; for every thing relating to Salabat-zing and the French troops in his fervice feemed to have been studiously avoided. The court of directors had explained their whole plan to the prefidency of Madras; but the ship which had the letters on board was unfortunately wrecked on a rock about 800 miles east of the Cape of Good Hope." The whole expedition was therefore laid afide, and the presidency of Madras directed all their force for the

fepoys, were fent to fcour the woods before the main prefent against Tulagee Angria, who had long been body centured to pals through fuch a dangerous defile.

The former met with no opposition, nor old any enemants.

The dominions of this pirate confifted of feveral Account of islands near Bombay, and an extent of land on the the pirate Tularee continent about 180 miles in length and from 30 to Angrica 60 in breadth. He poffeffed also several forts that had been taken from the Europeans by his ancestors; the trade of piracy having, it feems, been hereditary in the family, and indeed followed by most of the inhabitants of this coast. This was the more dangerous for trading veffels, as the land breezes do not here extend more than 40 miles out at fea, fo that the ships are obliged to keep within fight of land; and there was not a creek, harbour, bay, or mouth of a river along the whole coast of his dominions, where Angria had not erected fortifications, both as flations of discovery, and places of refuge to his veffels. His fleet confided of two kinds of veffels peculiar to this country, named grabs and gallivats. The former have generally two Defeription malts, though fome have three; the latter being about of his 300 tons burthen, and the former 150. They are fleet. built to draw little water, being very broad in proportion to their length; but narrowing from the middle to the end, where, instead of bows, they have a prowprojecting like a Mediterranean galley, and covered with a strong deck level with the main deck of the veffel, from which it is feparated by a bulk-head that terminates the fore-castle. As this construction subjects the grab to pitch violently when failing against a head fea, the deck of the prow is not inclosed with fides as the rest of the vessel, but remains bare, that the water which comes upon it may pass off without interruption. Two pieces of cannon are mounted on the main deck under the forecastle, carrying balls of nine or twelve pounds, which point forwards through port-holes cut in the bulk head, and fire over the prow : those of the broad-fide are from fix to nine pounders. The gallivats are large row-boats built like the grabe. but smaller; the largest scarce exceeding 70 tons burden. They have two masts, the mizen slightly made, and the main-maft bearing one large and triangular fail. In general they are covered with a spar-deck made of fplit bamboes, and carry only paterreroes fixed on fwivels in the gunnel of the veilel; but those of a larger fize have a fixed deck, on which they mount fix or eight pieces of cannon from two to four pounders. They have 40 or 50 flout oars, by which they may be moved at the rate of four miles an hour.

Angria had commonly a flect of eight or ten grabs, with 40 or 50 gallivats; which flipped their cables and put out to fea as foon as any veffel had the misfortune to come within fight of the port or bay where they lay. If the wind blew with any ftrength, their confluction enabled them to fail very fwifit; but if it was calm, the gallivats rowed, and towed the grabs.

As foon as they came within gunflot of the enemyy Their matter, and the grabs began the attack, ner of a firing at first only at the masts, and choosing the most racking advantageous positions for this purpose. If the vestel singular advantageous positions for this purpose. If the vestel singular data the definition of the singular to the distance of the defence was oblinate, they fent a number of gallivats with two or three hundred folders in each, who board-

formidable to all the nations in Europe; the English East India company had kept up a naval force for the protection of their trade at the rate of more than 50,000l. annually, and after all found it fcarcely adequate to the purpole. An unfucceisful attempt had reduce this been made in 1717, by the prefidency of Bombay, against the forts Geriah and Kennary, the principal flrong holds of Angria .- Another was made in 1722, under Admiral Matthews, against a fort named Coilabley, about 15 leagues fouth of Bombay : but this alfo mifcarried through the cowardice and treachery of the Portuguese, who pretended to affift the English. In 1735 fort Geriah was unfuccessfully attacked by a Dutch armament of feven ships, two bomb-ketches, and a numerous body of land forces; while all this time the piracies of Angria went on fuccefsfully, and not only trading veffels, but even men of war belonging to different nations, were captured by him, particularly in the month of February 1754, when three Dutch ships of 50, 36, and 18 guns, were burnt or taken by the piratical fleet.

This last success encouraged Angria so much, that he began to build veffels of a large fize, boafting that he should be master of the Indian seas. The Mahrattas having implored the affiftance of the English against this common enemy, Commodore William James was commodore fent from Bombay on the 22d of March 1755, with the Protector of 44, the Swallow of 16 guns, and two against his bomb ketches; but with infructions not to hazard the fleet by attacking any of the pirate's forts, only to blockade the harbours, while the Mahratta army carried on their operations by land. He had scarce begin his voyage when he fell in with a confiderable fleet of the pirates, which he would certainly have taken, had it not been for the timidity and dilatory behaviour of his allies, who could not by any means be induced to follow him. They had, however, invested three of the forts, but after a very flrange manner; for they durst not approach nearer than two miles, and even there entrenched themselves up to the chin, to be secure against the fire of the fort, which they returned only with one four pounder. The commodore, provoked at this pufillanimous behaviour, determined, for the honour of the British arms, to exceed the orders he had got. Running within 100 yards of a fort named Severndroog, he in a few hours ruined the walls, and fet it on fire; a powder magazine also blowing up, the people, to the number of about 1000, abandoning the place, and embarking on board of eight large boats, attempted to make their escape to another fort named Goa, but were all intercepted and made prisoners by the English. The whole force of the attack being then turned upon Goa, a white flag was foon hung out as a fignal to furrender. The governor, a great prince; and having formed a powerful combihowever, did not think proper to wait the event of a nation against the French, at last obtained an order capitulation, but without delay paffed over to Severndroor, where he hoped to be able to maintain his any marks of difgust, having under his command cations. The fire was now renewed against this for- train of artillery. His enemies, however, had no mind trefs; and the feamen having cut a paffage through one to allow him to depart in fafety; and therefore fent of the gates with their axes, the garrifon foon furren- orders to all the Polygars to oppose their passage, dered, at the same time that two other forts belieged fending 6000 Mahrattas after them to harass them on by the Mahrattas hung out flags of truce and capitu-

These successes were followed by the surrender of Bancoote, a strong fortified island now called Fort Victoria, and which the English retained in possession; but the The pirate other forts were delivered up to the Mahrattas. On finally fubthe arrival of Admiral Watfon in the beginning of No-dued by vember 1755, it was determined to root out the pirate Admiral at once, by attacking Geriah the capital of his domi-Watfon. nions; but it was fo long fince any Englishmen had feen this place, and the reports of its strength had been fo much exaggerated, that is was thought proper to reconnoitre it before any attack was made. This was done by Commodore James; who having reported that the fort, though ftrong, was far from being inacceffible or impregnable, it was refolved to profecute the enterprize with the utmost expedition and vigour. It was therefore attacked by fuch a formidable fleet, that Angria, lofing courage at their approach, fled to the Mahrattas, leaving Ceriah to be defended by his brother. The fort, however, was foon obliged to furrender, with no more loss on the part of the English than 10 men killed and wounded : but it was afterwards acknowledged, that this fuccefs was owing principally to the terror of the garrison occasioned by such a violent cannonade; for their fortifications appeared to have been proof against the utmost efforts of an enemy. All the ramparts of this fort were either cut out of the folid rock, or built of stones at least ten feet

In this fortress were found 200 pieces of brass can-non, with fix brass mortars, and a great quantity of ammunition and military stores, besides money and effects to the value of 125,000l. Angria's fleet was entirely destroyed, one of the ships having been set on fire by a shell from the English fleet, and the flames having spread from thence to all the rest. About 2000 people were made prifoners: among whom were the wife, children, mother, brother, and admiral of the pirate: but they were treated with the greatest clemency; and his family, at their own request, continued under the protection of the English at Geriah. All the other forts belonging to Angria foon submitted; fo that his power on the coast of Malabar was entirely

long laid edgeways.

While the affairs of the English went on thus suc- M. Bussy cefsfully, M. Buffy had been conftantly employed near difmiffed by Salabate the person of Salabat-zing, whom he had served in much zing. the same manner that the English had Mahomed Ali Cawn. As he made use of his influence with that prince, however, to enlarge the possessions of the French, and was continually making exorbitant demands upon him, the prime minister of Salabat-zing at length represented to him the danger and shame of allowing a fmall body of foreigners thus to give law to for their dismission. M. Bussy took his leave without ground notwithstanding the ruinous state of the forti- about 600 Europeans, with 5000 sepoys, and a fine their march.

many years deemed impregnable, fubdued in one day. Hydrabad with very little lofs. Here he took pof-

ND IND 103

India. fession of a garden formerly belonging to the kings of Golconda, where he refolved to keep his post until fuccours should arrive from Pondicherry and Masulipatam. Here Salabat-zing proposed to attack him; and the better to attain his purpose, applied to the English presidency at Madras for a body of troops to A detachaffift him in this fervice. Nothing could be more agreeable to those who had the power at that place than fuch an invitation; and a detachment of 400 Eutroops orropeans and 1500 fepoys was on the point of being ordered to the affiftance of Salabat-zing, when expresses gainst M. Buffy, but from Bengal informed them of the greatest danger that had ever threatened the British settlements in In-

This danger arose from the displeasure of Surajah Dowla, na- Dowla the new nabob of Bengal. His grandfather bob of Ben-Aliverdy Khan having died in April or May 1756, Surajah succeeded to the nabobship of Bengal, Bahar, and Orixa. He was congratulated on his accesfion by Mr Drake the English president at Calcutta, who requested his favour and protection in behalf of his countrymen. This was readily promifed, even to a greater degree than what had been shown by his grandfather; but in a short time his resentment was incurred by the imprisonment, as it is faid, of Omichund, an eminent Gentoo merchant, who had lived feveral years under the protection of the English government at Calcutta. Of this, however, Surajah Dowla did not directly complain: but founded his pretence of war upon the conduct of the English in repairing the fortifications of Calcutta; which indeed was abfolutely necessary on account of the great likelihood of a war with the French. On this account. however, the nabob fignified his difpleafure, and threatened an attack if the works were not instantly demolished. With this requisition the president and council pretended to comply; but nevertheless went on with their works, applying first to the French and then to the Dutch for affiftance; but as neither of these nations thought proper to interfere, the English were obliged to stand alone in the quarrel.

Surajah Dowla took the field on the 30th of May tion against 1756, with an army of 40,000 foot, 30,000 horse, Calcuta. and 400 elephants; and on the 2d of June detached 20,000 men to invest the English fort at Cassumbazar, a large town fituated on an ifland formed by the western branch of the Ganges. The fort was regularly built, with 60 cannon, and defended by 300 men, but principally fepoys. The nabob pretending a de-fire to treat, Mr Watts the chief of the factory was perfuaded to put himfelf in his power; which he had no fooner done, than he was made a close prisoner, along with Mr Batfon a furgeon who accompanied him. The two prisoners were treated with great indignity, and threatened with death; but two of the council who had been fent for by the tyrant's command were fent back again, with orders to perfuade the people of the factory to furrender it at difcretion. This propofal met with great opposition in the council; but was at last complied with, though very little to the advantage of the prifoners; for they were not only deprived of every thing they possessed, but stripped almost naked, and fent to Huquely, where they were closely confined.

The nabob, encouraged by this success, marched VOL. IX. Part I.

directly to Calcutta, which he invested on the 15th. India. Though he now threatened to drive the English entirely out of his dominions, yet he proposed an accommodation with Mr Drake, provided he would pay him his duty upon the trade for 15 years, defray the expences of his army, and deliver up the Indian mer-chants who were in the fort. This being refused, a Calcutta fiege commenced, and the place was taken in three taken, and days through the treachery of the Dutch guard * a number who had the charge of a gate. The nabob promifed ers fuffoon the word of a foldier, that no harm should be done cated. the English; nevertheless they were shut up in a pri- See fon fo strait, that out of 146 all perished in a single suttanight for want of air but 22. It was not, however, supposed that any massacre at this time was intended; and it is probable that he only gave orders to confine the prisoners closely for the night, without taking into confideration whether the place they were confined in was large or fmall.

The news of this difaster put an end to the expedition projected against M. Buffy; and Colonel Clive was instantly dispatched to Bengal with 400 Euro-Expedition peans and 1000 fepoys, on board of the fleet com- of admiral manded by Admiral Watson. They did not arrive Watson till the 15th of December, at a village called Fulta, fitu- nel Clive ated on a branch of the Ganges, where the inhabitants against the of Calcutta had taken refuge after their misfortune, nabob. Their first operations were against the forts Busbudgia. Tanna, Fort-William, and Calcutta now in the hands of the enemy. All these were reduced almost as soon as they could approach them. An expedition was then proposed against Huegley, a large town about 60 miles above Calcutta, and the place of rendezvous for all nations who traded to Bengal; its warehouses and shops being always filled with the richest merchandise of the country. This was likewife eafily reduced; and the city was destroyed, with the granaries and storehouses of falt feated on each fide the river; which proved very detrimental to the nabob, as depriving him of the means of fubfiftence for his army.

Surajah Dowla, enraged at this fuccess of the English, now seemed determined to crush them at once by a general engagement. From this, however, he was intimidated by a fuccefsful attack on his camp, which foon induced him to conclude a treaty. This took place on the 9th of February 1757, on the fol- Treaty conlowing conditions. I. That the privileges and im-cluded with munities granted to the English by the king (Mogul) him. should not be disputed. 2. That all goods with English orders should pass, by land or water, free of any tax. fee, or imposition. 3. All the Company's factories which had been feized by the nabob should be restored; and the goods, money, and effects which had been plundered, should be accounted for. 4. That the English should have permission to fortify Calcutta as they thought proper. 5. They should also have liberty to coin their own imports of bullion and gold.

As certain intelligence was now received of a war be- War with tween France and England, the first object that na the French turally occurred, after the conclusion of this treaty, was the reduction of the French power in the east i in consequence of which it was represented to Admiral Watfon, by a committee of the council of Bengal, that this was the only opportunity he perhaps might ever have of acting offenfively against them. An attack would

India. would therefore immediately have been made on Chandernagore, had not a deputation arrived from that place, requesting a neutrality in this part of the world until matters should be finally decided in Europe. The negociation, however, was broken off on a fuggestion that the government of Chandernagore, being fubordinate to that of Pondicherry, could not render any transaction of this kind valid. It remained therefore only to obtain the confent of the nabob to make The nabob an attack upon this place : but this feemed not likely complais to be got; for in ten days after the conclusion of the of the Eng- treaty, he fent a letter to the admiral, complaining of his intention. " It appears (favs he) that you have a defign to befrege the French factory near Houghley, and to commence hostilities against that nation. This is contrary to all rule and custom, that you should bring your animofities and differences into my country; for it has never been known, fince the days of Timur, that the Europeans made war upon one another in the king's dominions. If you are determined to beliege the French factories, I shall be necessitated, in honour and duty to my king, to affift them with my troops. You are certainly bound to abide by your part of the treaty firictly, and never to attempt or be the occasion of any troubles or difturbances in future within the provinces under my jurisdiction, &c." To this Admiral Watson replied, that "he was ready to desist from his intended enterprize if the French would agree to a folid treaty of neutrality; or if the nabob, as foubahdar (viceroy) of Bengal, would, under his hand, guarantee this treaty, and promife to protect the English from any attempts made by the French against their fettlements in his absence." This letter did not prove fatisfactory; the nabob having been informed by the French agent, that the English defigned to turn their arms against him as soon as they had made themselves masters of Chandernagore. This was stremuoufly denied by the admiral; and a number of letters paffed between him and the nabob, in one of which the latter made use of the following expressions, which were supposed to imply a tacit consent that Chandernagore should be attacked. " My forbidding war on my borders was because the French were my tenants, and upon this affair defired my protection : on this I wrote to you to make peace, and no intention had I of favouring or affilting them. You have understanding and generofity: if your enemy with an upright heart claims your protection, you will give him his life ; but then you must be well satisfied of the innocence of his intentions; if not, then whatfoever you think right, that do."

Having thus, as was supposed, obtained the con-Chanderfent of the nabob, an attack was made on Chandernamagore taker by the gore, which was foon reduced to the necessity of capitulating; though the French made a gallant defence, English. and, as Mr Ives informs us, "flood to their guns as long as they had any to fire." A messenger was difpatched with the news to Surajah Dowla three days after the place had furrendered, intimating also that the French had been purfued fome way up the country. This intelligence, however, feemed to be by no means agreeable, as he could scarce be induced to return an answer. At last he pretended displeasure on account of the defign of the English to infringe the treaties, and complained that they had ravaged some parts of

his dominions. This was denied on the part of the admiral; who in his turn accused the nabob of breach of promife, and neglect in fulfilling his engagements. The last letter fent by Admiral Watson to the pabob. of date 19th April 1757, concludes in this manner. " Let me again repeat to you, that I have no other views than that of peace. The gathering together of riches is what I despise; and I call on God, who sees and knows the fpring of all our actions, and to whom you and I must one day answer, to witness to the truth of what I now write: therefore, if you would have me believe that you wish for peace as much as I do, no longer let it be the subject of our correspondence for me to ask the fulfilment of our treaty, and you to promife and not perform it; but immediately fulfil all your engagements: thus let peace flourish and spread throughout all your country, and make your people happy in the re-establishment of their trade, which has fuffered by a ruinous and dettructive war." From this time both parties made preparations for war. The nabob returned no answer till the 13th of June, when he fent the following declaration of war. " According to my promifes, and the agreement made between us. I have duly rendered every thing to Mr Watts. ex-cept a very finall remainder: Notwithstanding this, Mr Watts, and the rest of the council of the factory at Cassembuzar, under the pretence of going to take the air in their gardens, fled away in the night. This is an evident mark of deceit, and of an intention to break the treaty. I am convinced it could not have happened without your knowledge, nor without your advice. I all along expected fomething of this kind, and for that reason I would not recal my forces from Plassey, expecting some treachery. I praise God, that the breach of the treaty has not been on my

part," &c. Nothing less was now resolved on in the English Thedepo-Nothing lets was now related on the nabob; fition of the nabob; fition of the nabob which at this time appeared practicable, by supporting the nano the pretentions of Meer Jaffier Ali Cawn, who had on. with other noblemen entered into a conspiracy against him. Meer Jaffier had married the fifter of Aliverdy Cawn, the predeceffor of Surajah Dowla; and was now

supported in his pretentions by the general of the horse, and by Jugget Seet the nabob's banker, who was reckoned the richest merchant in all India. By thefe three leading men the defign was communicated to Mr Watts the English resident at the nabob's court. and by him to Colonel Clive and the fecret committee at Calcutta. The management of the affair being left to Mr Watts and Mr Clive, it was thought proper to communicate the fecret to Omichund, through whom the necessary correspondence might be carrried on with Meer Jaffier. This agent proved fo avaricious, that Avariciit was refolved to ferve him in his own way; and by ous and a piece of treachery to him also, to gain their point treacherous with both parties. Two treaties were therefore writ- behaviour ten out; in one of which it was promifed to comply chund and with Omichund's demand, but in the other his name the Engwas not even mentioned; and both these treaties were lish. figned by all the principal perfons concerned, Admiral Watfon alone excepted, whom no political motives could influence to fign an agreement which he did not mean to keep. These treaties, the same in every refpect excepting as to Omichund's affair, were to the

following

ND

India. following purpose: 1. All the effects and factories belonging to the province of Bengal, Bahar, and O. Treatycon-rixa, shall remain in possession of the English, nor cluded with should any more French ever be allowed to settle in Meer Jaf- these provinces. 2. In consideration of the losses suflained by the English company by the capture and plunder of Calcutta, he agreed to pay one crore of rupees, or L. 1,250,000 sterling. 3. For the effects plundered from the English at Calcutta, he engaged to pay 50 lack of rupees, or L. 625,000. 4. For the effects plundered from the Gentoos, Moors, and other inhabitants of Calcutta, 20 lack, or L. 250,000. 7. For the effects plundered from the American merchants, inhabitants of Calcutta, feven lack, or L.87,500. 8. The distribution of all these sums to be left to Admiral Watson, Colonel Clive, Roger Drake, William Watts, James Kilpatrick, and Richard Becher, Efquires, to be disposed of by them to whom they think pro-

Surajah Dowla de mut to death.

All things being now in readiness, Colonel Clive began his march against Surajah Dowla on the 13th of June, the very day on which Surajah Dowla fent off his last letter for Admiral Watson. Before any act of hostility was committed, however, Colonel Clive wrote the nabob a letter, upbraiding him with his conduct, and telling him at laft, that "the rains being fo near, and it requiring many days to receive an answer, he had found it necessary to wait upon him immediately." This was followed by the decifive action at Plaffey; in which the treachery of Meer Jaffier, who commanded part of the nabob's troops, and flood neuter during the engagement, undoubtedly rendered the victory more easily acquired than it would otherwise have been. The unfortunate nabob fled to his capital with a few that continued faithful to him. He reached the city in a few hours; but not thinking himfelf fafe there, left it the following evening, difguifed like a Faquir, with only two attendants. By these he appears to have been abandoned and even robbed; for on the 3d of July he was found wandering forfaken and almost naked on the road to Patna. Next day he was brought back to Muxadabad; and a few hours after privately beheaded by Meer Jaffier's eldeft fon, to whose care he had been committed. The usurper took possession of the capital in triumph; and on the 29th of June Colonel Clive went to the palace, and in prefence of the raighs and grandees of the court folemnly handed him to the mufnud or carpet and throne of state, where he was unanimously faluted foubahdar or nabob, and received the fubmiffion of all prefent.

While these transactions were going forward with the nabob, the utmost efforts were used to expel the in quest of French entirely from Bengal. By the articles of capitulation at Chandernagore, the whole of that garrifon were to continue prisoners of war; but about the time of figning the treaty, Mr Law with a finall body of troops made his escape out of Cassembuzar, and bent his march towards Patna. There he had been protected by the late nabob; and on the commencement of fresh hostilities, had collected about 200 French, the only remains of that nation in Bengal, to make an attempt to fuccour him. With these he was within two hours march of Surajah Dowla's camp when the battle of Plasfey was fought: on hearing the

formed of the nabob's escape, he marched again to his affiftance, and was within a few hours of joining him when he was taken. Three days after he was purfued by Major Eyre Coote at the head of 223 Europeans, three companies of Sepoys, 50 Lascars or Indian failors, and 10 Marmutty men or pioneers to clear the roads, together with two pieces of cannon, fix pounders. On this expedition the major exerted his utmost diligence to overtake his antagonist, and fpent a very confiderable space of time in the pursuit : for though he fet out on the 6th of July, he did not return to Muxadabad till the 1st of September. Mr Law, however, had the good fortune to escape; but though the major did not fucceed in what was propofed as the principal end of his expedition, he was nevertheless, says Mr Ives, of considerable service to the company and to his country in general. He had obliged Ramnarain, the most powerful rajah in the country, to fwear allegiance to Meer Jaffier; he laid open the interior flate of the northern provinces; and, in conjunction with Mr Johnstone, gave the company fome infight into the faltpetre bufinefs, from which fuch advantages have fince been derived to the public.

Before the return of Major Coote, Admiral Pocock Death of

had fucceeded to the command of the fleet, in confe-Watfonquence of the decease of Admiral Watson, who died on the 16th of August. The joy of the British was confiderably damped by the lofs of this gentleman, who had gained a great and deferved reputation both in the military line and every other. News were also received, that the French had been very successful on the coast of Coromandel. Salabat-zing, as has already been observed, had applied to the English for affistance against the French; but as they were prevented from performing their agreement by the disafter at Calcutta, he found himfelf under a necessity of accommodating the differences with his former friends, and to admit them again into his fervice. M. Buffy was now reinforced by the troops under M. Law; who had collected as many Europeans in his journey as made up 500 with those he had at first. With these Success of he undertook to reduce the English factories of Inge-the French ram, Bandermalanka, and Vizagapatnam. As none of on the Cothe two former places were in any state of defence, the romandel greatest part of the company's effects were put on shipboard on the first alarm; but as Vizagapatnam was garrifoned by 140 Europeans and 420 Sepoys, it was supposed that it would make some defence. If any was made, however, it appears to have been very trifling; and by the conquest of this the French became mafters of all the coasts from Ganjam to Massulipatnam. In the fouthern provinces the like had fuccefs attended the British cause. The rebel Polygars having united their forces against Mazuphe Cawn, obtained a complete victory over him; after which the English sepoys, being prevailed upon to quit Madura, the conqueror feized upon that city for himfelf.

In the beginning of 1758, the French made an attempt on Trinchinopoli. The command was given to M. d'Autrenil, who invested the place with goo men in battalion, with 4000 sepoys, 100 husfars, and a great body of Indian horse. Trinchinopoli was then in no condition to withstand such a formidable power, news of which he stopped; but afterwards being in- as most of the garrison had gone to besiege M dura Bbz

78 Meer Jaffier proclaime d nabob of Bengal.

Colonel Coote's expedition Mr Law.

India. under Captain Caillaud; but this commander having received intelligence of the danger, marched back with all his forces, and entered the town by a difficult road which the enemy had neglected to guard; and the French general, disconcerted by this successful manœuvre, drew off his forces, and returned to Pondicherry.

This fortunate transaction was succeeded by the fiege of Madura in which the English were so vigooufly repulfed, that Captain Caillaud was obliged to turn the fiege into a blockade in order to reduce the place by famine. But before any progress could be made in this way, Mazuphe Cawn was prevailed upon to give it up for the fum of 170,000 rupees. A large garrison of sepoys was again put into the place, and Captain Caillaud returned to Trinchinopoli.

An unfuccefsful attempt was now made by Colonel Ford on Nellore, a large town furrounded by a thick mud-wall, with a dry ditch on all fides but one, where there is the bed of a river always dry but in the rainy feason. The enterprise is fail to have proved unfuccefsful through the unheard-of cowardice of a body of fepoys, who having sheltered themselves in a ditch, abfolutely refused to flir a step farther, and rather chose to allow the rest of the army to march over them to the affault, than to expose themselves to danger. Several other enterprifes of no great moment were undertaken; but the event was on the whole unfavourable to the English, whose force by the end of the campaign was reduced to 1718 men, while that of the French amounted to 3400 Europeans, of whom 1000 were fent to Pondicherry.

French defeated at fea by ad. miral Po-

cock.

Both parties now received confiderable reinforcements from Europe; Admiral Pocock being joined on the 24th of March by Commodore Stevens with a foundron of five men of war, and the French by nine men of war and two frigates, having on board General Lally with a large body of troops. The English admiral no fooner found himself in a condition to cope with the enemy than he went in quest of them; and an engagement took place, in which the French were defeated with the lofs of 600 killed and a great many wounded, while the English had only 29 killed and 89 wounded. The former returned to Pondicherry, where they landed their men, money, and troops. After the battle three of the British Captains were tried for misbehaviour, and two of them dismissed from the command of their ships. As foon as his vessels were refitted, the admiral failed again in quest of the enemy, but could not bring them to an action before the 3d of August, when the French were defeated a fecond time, with the lofs of 251 killed and 6:2 wounded.

Notwithstanding this fuccess at sea, the English were greatly deficient in land forces; the re-establishment of their affairs in Bengal having almost entirely drained the fettlements on the coast of Coromandel of the troops necessary for their defence. The confequence of this was the lofs of Fort St David, which General Lally reduced, destroying the fortifications, demolishing also the adjacent villages, and rajudicial to his affairs. He proved fuccefsful, however, taliation for what the French had done in the neighin the reduction of Devicottah, but was obliged to re- bourhood of Madras. He then fet about the fiege of

treat with loss from before Tanjore, his army being greatly diffressed for want of provisions; and money in particular being fo deficient, that on the 7th of August the French seized and carried into Pondicherry a large Dutch thip from Batavia, bound to Negapatnam, and took out of her about L. 5000 in fpecie.

From this time the affairs of the French daily declined. On their retreat from Tanjore, they abandoned the island of Seringham; however, they took Tripaffore, but were defeated in their defigns on the important post of Chinglapet, fituated about 45 miles fouth-west of Madras. Their next enterprizes on Fort St George and Madras were equally unfuccefsful. The latter was belieged from the 12th of December 1758 to the 17th of February 1750, when they were obliged to abandon it with great lofs; which difafter greatly contributed to deprefs their fpirits, and abate those fanguine hopes they had entertained of becoming mafters in this part of the world.

The remainder of the year 1759 proved entirely fa-

vourable to the British arms. M. d'Ache the French admiral, who had been very roughly handled by Admiral Pocock on the 3d of August 1758, having refitted his fleet, and being reinforced by three men of war at the islands of Mauritius and Bourbon, now ventured once more to face his antagonist, who on his part did not at all decline the combat. A third battle French deenfued on the 10th of September 1759, when the fested a French, notwithstanding their superiority both in num-third time ber of ships and weight of metal, were obliged to re-treat with considerable loss; having 1500 men killed Pocock. and wounded, while those on board the English fleet did not exceed 569. By the 17th of October the English fleet was completely resitted; and Admiral

Pocock having been joined by a reinforcement of four

men of war, foon after returned to England. All this time the unfortunate General Lally had been employed in unfuccefsful endeavours to retrieve the affairs of his countrymen: still, however, he attempted to act on the offenfive; but his fate was at General last decided by laying siege to Wandewash, which had Lally delately been taken by Colonel Coote. The advantage feated at in numbers was entirely in favour of the French ge- Wandeneral; the English army consisting only of 1700 Eu- wash. ropeans including artillery and cavalry, while the French amounted to 2200 Europeans. The auxiliaries on the English side were 3000 black troops, while those of the French amounted to 10,000 black troops and 300 Caffres; nor was the odds less in proportion in the artillery, the English bringing into the field only 14 pieces of cannon and one howitzer, while the French had 25 pieces in the field and five on their batteries against the fort. The battle began about eleven o'clock on the 22d of January 1760, and in three hours the whole French army gave way and fled towards their camp; but quitted it on finding themfelves purfued by the English, who took all their cannon except three fmall pieces. They collected themfelves under the walls of Cheltaput, about 18 miles from the field of battle, and foon after retired to Ponvaging the country in fuch a manner as filled the na- dicherry. Colonel Coote caufed the country to be tives with indignation, and in the end proved very pre- wasted to the very gates of this fortress by way of re-

They are defeated a fecond time.

Take fort St David.

All the French forts in India, an gy their

ken.

derable detachment of the enemy was intercepted by Captain Smith; the Fort of Timmery was reduced by Major Monfon, and the city of Arcot by Captain Wood. This laft conquest enabled the English to reftore the nabob to his dominions, of which he had been deprived by the French; and it greatly weakened both the French force and interest in India. M. Lally, in the mean time, had recalled his forces from Seringham, by which means he augmented his army with 500 Europeans. All these were now shut up in Pondicherry, which was become the last hope of the French in Iudia. To complete their misfortunes. Admiral Cornish arrived at Madras with six men of war; and as the French had now no fleet in thefe parts, the admiral readily engaged to co-operate with the land forces. The confequence was the reduction of Carical, Chellambrum, and Verdachellum, by a strong detachment under Major Monson; while Colo-Pondicher- nel Coote reduced Permucoil, Alamperva, and Waldour. Thus he was at last enabled to lay siege to capital, ta- Pondicherry itself. Previous to this, however, it had been blockaded by fea and land, which reduced the place to great straits for want of provisions, and induced a mutinous disposition among the garrison. The batteries were not opened till the beginning of December 1760; and the place capitulated on the 15th of January 1761, by which an end was put to the power of the French in this part of the world.

23 Difagreeable fituanabob of Bengal.

While the English were thus employed in effectually reducing the power of their rivals in every part of Intion of the dia, Meer Jaffier, the nabob of Bengal, who had been raifed to that dignity by the ruin of Surajah Dowla, found himself in a very disagreeable situation. The treasure of the late nabob had been valued at no less than 64 crore of rupees, about 80 millions flerling: and in expectation of fuch a vaft fum, Meer Jaffier had no doubt thoughtlefsly fubmitted to the enormous exactions of the English, already mentioned. On his accession to the government, however, the treasure of which he became mafter fell fo much short of expectation, that he could by no means fulfil his engagements to them and fupply the expences of government at the fame time. This foon reduced him to the necessity of mortgaging his revenues to fupply prefent demands; and by this ruinous expedient he put it out of his own power ever to extricate himfelf. In this dilemma his grandees became factious and discontented, his army mutinous for want of pay, and he rendered himfelf odious to his subjects by the exactions he was necessitated to lay upon them. The English, who for their own interest had raised him to the supreme power, no fooner found that he was incapable of answering their purpose any longer, than they began to scheme against him; and in order to have fome colour of reason for pulling down the man whom they had just fet up, they of the Eng. either invented or gave ear to the most malicious calishtowards lumnies against him. The charges brought against him were shortly these: 1. That foon after his advancement he had refolved to reduce that power which raifed him to the dignity. 2. That, to effect this, he affaffinated or banished every person of importance whom he suspected of being in the English interest. 3. That he negociated with the Dutch to introduce an armament for the expulsion of the English. 4. That

India. Cheltaput, which furrendered in one day: a confi- he had in different inflances been guilty of the India. deepest deceit and treachery towards the English, his best benefactors and allies. 5. That at three different periods the English commander in chief had been basely deferted both by the nabob and his son, when he and the troops were liazarding their lives for them. 6. That he meditated a fecret and feparate treaty with Shah-Zaddah, the Mogul's fon, and had intended to betray the English to him. 7. That the whole term of his government had been one uninterrupted chain of cruelty, tyranny, and oppression. 8. That he meditated, and was near carrying into execution, an infamous fecret treaty with the Mahrattas, which would have proved the total destruction of the country if it had taken place. 9. That he threw every possible obstruction in the way of the collection of the English tunkas or affignments upon lands. 10. That he encouraged the obstructions given to the free currency of the English ficcas; by which the company suffered heavy losses. II. That by his cruckies he had rendered it scandalous for the English to support his government any longer; and, 12. That by his mifconduct, he had brought the affairs of the company as well as his own into the utmost danger of ruin.

In what manner these charges were supported it is difficult to know, nor perhaps were the accufers very folicitous about the strength of their evidence. This feems the more probable, as the accufations of cruelty were, in fome inflances at leaft, void of foundations On the 13th of June 1760, Mr Holwel wrote from Calcutta to Mr Warren Haftings, that by express he had received intelligence of the murder of the princeffes of Aliverdy Khan and Shah Amet, in a most inhuman manner, by Meer Jaffier's orders. He was faid to have fent a Jemmatdaar with 100 horse to Jesseraut Khan to carry this bloody fcheme into execution; with feparate orders to the Jemmatdaur to put an end to their lives. He refused acting any part in the tragedy, and left it to the other; who carried them out by night in a boat, tied weights to their legs, and threw them overboard. They struggled for some time, and held by the gunwale of the boat; but by ftrokes on their heads, and cutting off their hands, they were at last forced off and drowned. In like manner we were told that many others-of Surajah Dowla's relations had perished; yet when it was thought proper to replace Meer Jaffier in 1761, all these dead perfens were found alive excepting two. It must also be remembered, in behalf of the unfortunate nabob, that besides the sums exacted of him by the English at his accession, he had ceded to them a large extent of territory, and granted them fo many immunities in trade, that he had in a manner deprived nimfelf of all his resources; and it was impossible for him to defray the necessary expences without either extorting money from his subjects, or infringing the privileges he had fo inconfiderately granted.

There were two accounts of this remarkable revolution published, materially differing from one another. acc unts The first was given in a memorial drawn up at a of his deconfultation at Fort William, November 10. 1760, polition. where were prefent Henry Vansitart, Esq; president; William Ellis, B. Sumner, William M'Gnire, Henry Vereft, and Henry Smyth, Eigs. "We refolved (fays the governor) to give the nabob the next day (Octo-

Shameful behav.our India. ber 19. 1760) to reflect upon the letters I had delivered him, proposing some measures for regulating thefe abuses. I heard nothing from him all that day: but found by my intelligence that he had been in council at his old advifers, whose advice, I was fure, would be contrary to the welfare of the country and of the company. I therefore determined to act immediately on the nabob's fear. There could not be a bester opportunity than the night of the 19th offered, it being the conclusion of the Gentoo feaft, when all the principal people of that cast would be pretty well fatigued with their ceremonies. Accordingly I agreed with Colonel Caillaud, that he should cross the river with the detachment between three and four in the morning; and having joined Cossim Ali Khan and his people. march to the nabob's palace, and furround it just at day-break. Being extremely defirous to prevent disturbance or bloodshed, I wrote a letter to the nabob, telling him, I had been waiting all the day in expectation that he would have fettled the urgent affairs upon which I conferred with him yesterday; but his having favoured me with no answer, plainly showed that all I could represent to him for the good of his country would have no effect, as long as his evil counfellors were about his person, who would in the end deprive him of his government and ruin the company's affairs. For this reason I had fent Colonel Caillaud with forces to wait upon him, and to expel those bad counsellors, and place his affairs in a proper state, and I would shortly follow. This letter I gave to the colonel, to fend to the nabob at fuch a time as he should think most expedient. Meafures were taken at the fame time for feizing his three unworthy ministers, and to place Cossim Ali Khan in the full management of all the affairs, in quality of deputy and fucceffor to the nabob.

"The neceffary preparations being made with all care and fecrecy possible, the colonel embarked with the troops, joined Cossim Ali Khan without the least alarm, and marched into the court-yard of the palace just at the proper instant. The gates of the inner court being shut, the colonel formed his men without, and fent the letter to the nabob, who was at first in a great rage, and long threatened that he would make what refistance he could, and take his fate. The colonel forbore all hostilities, and feveral messages passed between him and the nabob. The affair remained in this doubtful flate for two hours, when the nabob, finding his perfiding was to no purpose, fent a message to Cossim Ali Khan, informing him that he was ready to fend the feals and all the enfigns of dignity, provided he would agree to take the whole charge of the government upon him, to discharge all arrears due to the troops, to pay the usual revenue to the king, to fave his life and honour, and to give him an allowance fufficient for his maintenance All these conditions being agreed to, Cossim Ali was proclaimed; and the old nabob came out to the colonel, declaring that he depended on him for his life. The troops then took possession of all the gates; and the old nabob was told, that not only his person was safe, but his governmore buliness in the city, where he should be in con- more to be continued. He hoped, however, if they

tinual danger from Cossim Ali Khan; and if he was permitted to go and live at Calcutta, he should be contented. Coffim Ali Khan was now placed on the musnud, and the people in general seemed much pleafed with the revolution. The old nabob did not think himfelf fafe even for one night in the city. Coffim Ali Khan fupplied him with boats, and permitted him to take away about 60 of his family, with a reafonable quantity of jewels. He begged that he might fleep in his boat that night; which he according did, and on the morning of the 22d of October he fee out for Calcutta, and arrived there on the 20th. He was met by a deputation from the council, and treated with every mark of respect due to his former dignity."

The fecond account of this affair was not published till the 11th of March 1762, and was figned Eyre Coote, P. Amyatt, John Cavnac, W. Ellis, S. Batfon, H. Verelft. "In September 1760 (fay they), when there was not the least appearance of a rupture or difgust between us and the nabob, but friendship and harmony fublifting, Meer Cossim Khan his fon-in-law came down to Calcutta, and having flaid a short time returned to Moorshebad. A few days after, Mr Vanfittart went up to that city on the pretence of a vifit to the nabob Meer Jaffier. Colonel Caillaud, with 200 Europeans and some sepoys, attended him; who, it was pretended, were going to join the army at Patna. When Mr Vansittart arrived at Moradbaug, the nabob paid him two vifits; at the last of which Mr Vansittart gave him three letters, proposing the reformation of the abuses in his government, insisted on his naming fome person among his relations to take charge of the fubahship, and particularly recommended Cossim Ali Khan, who was fent for, and the nabob defired to ftay till he came: But the nabob, being greatly fatigued, was fuffered to depart to his palace. The night and following day passed in concerting measures with Cossim Ali how to put in excution the plan before agreed on in Calcutta, where a treaty was figned for this purpose. In consequence of these deliberations, our troops croffed the river next night, and being joined by Cossim and his party, surrounded the nabob's palace. A letter from Mr Vansittart was sent in to the nabob, demanding his compliance with what had been proposed to him. To this the nabob returned for answer, ' that he never expected such usage from the English: that while a force was at his gates, he would enter into no terms.' A meffage was fent in, that if he did not directly comply, they should be obliged to ftorm the palace. Aftonished and terrified at this menace, he opened the gates, exclaiming, that he was betrayed; that the English were guilty of perjury and breach of faith; that he perceived their defigns against his government; that he had friends enough to hazard at least one battle in his desence: but although no oaths were facred enough to bind the English, yet as he had fworn to be their faithful friend, he would never fwerve from his engagement, and rather fuffer death than draw his fword against them.' So fuspicious was he of being fold, that he defired to ment too if he pleased, of which it was never intend- know what sum of money Cossim Ali Khan was to ed to deprive him. He answered, that he had now no give for the fubahship, and he would give half as much

India

him to the mercy of his fon-in-law, from whom be feared the worlt; but wished they would carry him from the city, and give him a place of fafety in Calcutta. " This last request of the nabob was construed in the light of a voluntary refignation. Our troops took poffession of the palace; Meer Cossim was raised to the mufnud; and the old nabob hurried into a boat with a few of his domestics and necessaries, and fent away to Calcutta in a manner wholly unworthy of the high rank he fo lately held, as was also the scanty subfiftence allowed him for his maintenance at Calcutta by his fonin-law. Thus was Jaffier Ali Khan deposed, in breach of a treaty founded on the most solemn oaths, and in violation of the national faith."

According to this account, the fervants of the Company, who were the projectors of the revolution, made no fecret that there was a prefent promised them of 20 lacks of rupees from Coffim, who was defirous of making the first act of his power the affaffination of Jaffier, and was very much displeased when he found that the English intended giving him protection at Calcutta.

It could scarce be supposed that Meer Cossim, raised

to the nabobish in the manner we have related, could be more faithful to the English than Meer Jaffier had been. Nothing advantageous to the interests of the company could indeed be reasonably expected from such a revolution. No fucceffor of Meer Jaffier could be more entirely in subjection than the late nabob, from his natural imbecility, had been. This last consideration had induced many of the council at first to oppose the revolution; and indeed the only plausible pretence for it was, that the administration of Meer Jaffier was fo very weak, that, unless he was aided and even controuled by fome perfons of ability, he himfelf must foon be ruined, and very probably the interests of the company along with him. Meer Cossim, fim schemes however, was a man of a very different disposition from his father in-law. As he knew that he had not been ferved by the English out of friendship, so he did not think of making any return of gratitude; but instead of this, confidered only how he could most easily get rid of fuch troublesome allies. For a while, however, it was necessary for him to diffemble, and to take all the advantage he could of the power of his allies whilft it could be ferviceable to him. By their affiftance he cleared his dominions of invaders, and ftrengthened his frontiers against them; he reduced, by means of the fame affiftance, the rajahs or independ ent Indian chiefs who had rebelled in the time of his predeceffor, obliging them to pay the usual tribute; by which means he repaired his finances, and thereby fecured the discipline and fidelity of his troops. Having thus, by the affiftance of the English forces, brought his government into fubjection, he took the most effectual means of fecuring himself against their power. As the vicinity of his capital, Muxadabad, to Calcutta, gave the English sactory there an opportunity of inspecting his actions, and interrupting his defigns when they thought proper, he took up his refidence at Mongheer, a place 200 miles farther up the Ganges, which he fortified in the best and most expeditious manner he could. Being very fensible of the advantages of the European discipline, he resolved

India. intended to dethrone him, that they would not leave to form his army on a new model. For this purpose he collected all the Armenian, Persian, Tartar, and other foldiers of fortune, whose military characters he fupposed might serve to raise the spirits of his Indian forces, and abate their natural timidity. He also carefully collected every wandering European who had borne arms, all the Sepoys who had been difmiffed from the English service, distributing them among his troops, in order to teach them the English exercise. He changed the fashion of the Indian muskets from matchlocks to firelocks; and as their cannon were almost as deficient as their small arms, he procured a pattern of one from the English, by which he soon formed a train of artillery: and having thus done every thing in his power to enable himfelf to withfland the English by force of arms. he refolved also to free his court from their emissaries. by imprisoning or putting to death every person of any confequence in his dominions who had shown any attachment to their interest.

> His next step was to free himself from some of those restraints which his predecessor Meer Jassier, and even he himfelf, had been obliged to lay upon the trade of the country, in order to gratify the avarice of his European allies. At his accession indeed he had ceded to the company a tract of land worth no less than 700,000 l. annually, besides 70,000 l. a year on other accounts. All this, however, was not fufficient; the immunities granted them in trade were of still worse confequence than even those vast concessions. He knew by experience the diffress which these immunities had brought upon his predeceffor, and therefore determined to put an end to them. In pursuance of He lave this refolution, he began, in the year 1762, every duties on where to subject the English traders to the payment the Engof certain duties throughout his dominions, and re-dersquired that their disputes, if beyond the limits of their own jurisdiction, should be decided by his magistrates. This gave fuch an alarm at Calcutta, that, in November 1762, the governor Mr Vansittart waited on him in person at Mongheer, in order to expostulate with him upon the subject. The nabob answered his remonstrances in the following manner. "If (faid he) the fervants of the English company were permitted to trade in all parts, and in all commodities, custom free, as many of them now pretend, they must of course draw all the trade into their own hands, and my customs would be of so little value, that it would be much more for my interest to lay trade entirely open, and collect no customs from any person whatever upon any kind of merchandize. This would draw a number of merchants into the country, and increase my revenues by encouraging the cultivation and manufacture of a large quantity of goods for fale, at the fame time that it would effectually cut off the principal fubject of disputes which had disturbed the good understanding between us, an object which I have more than any other at heart."

By these intimations Mr Vansittart was very much disconcerted; nor indeed was it in any person's powerto devife a plaufible answer. What the nabob had threatened was evidently in his power; and though he had laid the trade entirely open, no reasonable fault could have been found with him. The proceeding, however, tended evidently to destroy the private trade:

English.

and dif-

of Patna

taken by

the Eng-

lifh, but

taken.

Mr Vansittart therefore thought proper to submit to certain regulations, by which the trade of the English was put under certain reftrictions.

This new agreement being instantly put in execution on the part of the nabob, excited the utmost inowned by dignation at Calcutta. On the 17th of January 1763. the council paffed a refolution, difavowing the treaty made by the governor, and affirmed that he affumed a right to which he was by no means authorized; that the regulations proposed were dishonourable to them as Englishmen, and tended to the ruin of all public and private trade; and that the prefident's iffuing out regulations independent of the council was an absolute breach of their privileges. They fent orders therefore to all the factories, that no part of the agreement between the governor and nabob should be submitted to. Application was again made to Meer Cossim to perfuade him to a third agreement; but before the fuccess of this negociation could be known, hostilities

commenced on the part of the English. The city

There was at that time in the city of Patna (fituated on the Ganges, about 300 miles above Calcutta), a fortified factory belonging to the East India company, where were a few European and Indian foldiers. By this factory the city was fuddenly attacked on the ly after re-25th of June 1763, and inftantly taken, though it was defended by a ftrong garrison, and the fortifications had been newly repaired. The governor and garrifon fled out into the country on the first appearance of danger: but perceiving that the victors took no care to prevent a furprife, he fuddenly returned with a reinforcement from the country, retook the city, and either cut in pieces or drove into their fort all the English who were in it, after having been only four hours in possession of the place. The English, disheartened by this disaster, did not now think themselves able to defend their fort against the Indians; for which reason they left it, with a design to retreat into the territories of a neighbouring nabob; but being purfued by a fuperior force, they were all either killed or

95 Maffacre of the

puties.

This piece of perfidy, for fuch it certainly was, the nabob repaid by another, viz. flaughtering the depu-English deties who had been fent him by the council of Calcutta to treat about a new agreement with regard to commercial affairs. They fet out from Mongheer on the 24th of June, having been unable to bring Meer Coffim to any terms; and though he furnished them with the ufual passports, yet, as they were passing the city of Muxadabad, they found themselves attacked by a number of troops affembled for that purpose on both fides of the river, whose fire killed several gentlemen in the boats. Mr Amyatt, the chief of the embaffy, landed with a few sepoys, whom he forbid to fire, and endeavoured to make the enemy's troops understand that he was furnished with the nabob's passports, and had no defign of committing any hostilities; but the enemy's horse advancing, some of the sepoys fired notwithstanding Mr Amyatt's orders to the contrary. On this a general confusion ensued, and Mr Amyatt, with most of the small party who attended him, were cut

> These acts of treacherous hostility were soon follow-Nº 165.

carried on by the gentlemen of the factory; and even ed by a formal declaration of war. Meer Jaffier, not. India. was proclaimed nabob of Bengal, and the army im- Meer lafmediately took the field under the command of Major fier again Adams. The whole force, however, at first consisted proclaimed only of one regiment of the king's troops, a few of nabob. the company's, two troops of European cavalry, ten or companies of sepoys, and 12 pieces of cannon. The Major very foon came to action with the enemy; and having Adams got the better in two skirmishes, cleared the country against of them as far as Cassimbuzar river, a branch of the Meer Cof-Ganges, which lay between Calcutta and Muxadabad, fim, or Murshudabad, the capital of the province.

The war was now carried on with uninterrupted fuccess on the part of the English; nor does it appear that all the pains taken by Meer Cossim to discipline his troops had made them in the least more able to cope with the Europeans. The English were suffered to pass the river without opposition; but an army of 10,000 Indians were advantageously posted between the river and the city. These were entirely defeated, The Inand Major Adams pushed on directly for the capital dians de-In his way he found the Indians again strongly posted feated. with intrenchments 15 feet high, and defended by a numerous artillery. This ftrong post was taken by ftratagem; a feint being made with a fmall body of troops against that part where the enemy had collected their greatest strength. Thus the attention of the enemy was drawn entirely to that place, without regarding others where no attack was apprehended. The greatest part of the English army, however, had in the night-time marched round the Indian fortification, and by day break made a furious affault on a place where there was only a flight guard. These instantly fled; the intrenchments were abandoned; and the city, which was protected only by them, fell of course into the hands of the conquerors.

This fuccess of the English served only to make them redouble their diligence. They now penetrated into the heart of the province, croffed the numerous branches of the Ganges, and traversed morasses and forests in quest of their enemy. Meer Cossim, on the other hand, was not wanting in his defence; but the utmost efforts he could use were totally insufficient to stop the career of an enemy fo powerful and now flushed with victory. The two armies met on the banks of a river called Nu. Meer Cofnas Nullar, on the 2d of August 1763. The Indians im entire-had chosen their post with great judgment, and had at Nunas much more the appearance of an European army than Nullas, ever was observed before, not only in their arms and accourrements, but in their division into brigades, and even in their clothing. The battle was much more obstinate than usual, being continued for four hours; but though the Indian army confifted of no fewer than 20,000 horse and 8000 foot, the English proved in the end victorious, and the enemy were obliged to quit the field with the loss of all their can-

From this time the Indians did not attempt any regular engagement with the English. They made a stand indeed at a place called Auda Nulla, which they had fortified in fuch a manner that it feemed proof against any fudden attack. But here also they fuffered themfelves to be deceived in a manner fimilar to that abovementioned, and the place was taken with great flaugh100

TOT

Trhuman

etaken

ter. They now abandoned a vaft tract of country; and tho' there were feveral very defentible pofts one behind another, fo much were they difheartened by this miffortune, that they never attempted to flop the progress of the English, but laid open the whole country

to the very gates of Mongheer.

The next operation was the fiege of Mongheer it-Mongheer felf: which, notwithstanding all the pains Meer Cossim had been at to fortify it, held out no more than nine days after the trenches were opened : fo that nothing now remained to complete the conquest of Bengal but the reduction of the city of Patna. The unfortunate Meer Cossim, in the mean time, enraged at the irrefiftible progress of the English, vented his rage on the unhappy prisoners taken at Patna; all of whom, to the number of about 200, he caused to be inhumanly murthe English dered. This villany was perpetrated by one Somers, a Patna. German, who had originally been in the French fervice, but deferted from them to the English East India company, and from the company to Meer Cossim. This affaffin, by the Indians called Soomeroo, having invited the English gentlemen to sup with him, took the opportunity of borrowing their knives and forks, on pretence of entertaining them after the English manner. At night, when he arrived, he stood at some distance in the cook-room to give his orders; and as foon as the two first gentlemen, Mr Ellis and Lushington, entered, the former was feized by the hair, his head pulled backward. and his throat cut by another. On this Mr Lushington knocked down the murderer with his fift, feized his fword, wounded one and killed two before he himfelf was cut down. The other gentlemen being now adarmed, defended themselves, and even repulsed the sepoys with plates and bottles. Somers then ordered them on the top of the house to fire down on the prifoners; which they obeyed with reluctance, alleging that they could not think of murdering them in that manner, but if he would give the prisoners arms, they would fight them; on which he knocked feveral of them down with bamboes. The confequence was, that all the gentlemen were either shot or had their throats cut. Dr Fullarton was the only person who escaped having received a pardon from the tyrant a few days before the maffacre.

This inhumanity was far from being of any fervice to the cause of Meer Coffim. Major Adams marched without delay from Mongheer to Patna; and as the place was but indifferently fortified, it could make but a feeble refiffance The cannon of the English soon made a practicable breach, and in no longer time than eight days this great city was taken by form. Thus the nabob was deprived of all his fortified places, his army reduced to a small body, and himself obliged to by the fly to Sujah Dowla nabob of Oude, who acted as life. grand vizier to the Mogul. Here he was kindly received, and an afylum promifed for his person, but admittance was refused to his army, nor would this prince confent at any rate to make his country a feat of war. The English were now entire masters of Bengal; for though Meer Jaffier was proclaimed nabob, it is not to be supposed that he had now any authority farther than what they pleased to give him Major Adams did not long furvive the conquest of Patna, which was taken on the 6th of November 1763; he died in the month of March 1764.

Meer Cossim being thus driven out, an agent was sent Vol. IX. Part I.

from Calcutta to Sujah Dowla, proposing an alliance with him and the Mogul, who was along with him. and offering to affift them against Meer Coffim or any tog other enemy who should attempt an invasion of their Alliance dominions; in return for which, it was expected that with Sujah they should declare themselves open enemies to Meer Dowla, Coffim, and use their utmost endeavours to seize and deliver him up with all his effects. This defign was communicated to Major Adams on the 8th of December 1769; but as he was next day to refign the command of the army, Major Carnac was defired to take the command upon him, and to watch the motions of Meer Cossim, as well as to guard the dominions of Meer Jaffier against any hostilities which might be attempted. It was also refolved, that in case Meer Cossim should prevail upon the Mogul and Sujah Dowla to affift him, Major Carnac was defired to advance to the banks of the river Carumnassa, and there oppose the

entrance of any hostile army It foon appeared that the friendship of the English was not what Sujah Dowla defired. He confidered them as rapacious usurpers, who having got a footing in the country under pretence of commerce, could

be fatisfied with nothing lefs than the entire poffession of it, to the ruin of the natural inhabitants. In the Proposed beginning of February 1764, therefore, it was known alliance red that Sujah Dowla had determined to affift Meer Coffin jected by in attempting to recover Bengal. The prefident and la. council on this wrote him, that though they heard fuch a report, they could not believe it, confidering the former connections subfifting between him and the chiefs of the company, and were perfuaded he would not act in fuch an unjust manner : but if it really was his intention to espoule the cause of Meer Cossim, they informed bim that they were refolved to keep Bengal free from troubles, and carry the war into the dominions of Sujah Dowla himfelf. To this the nabob replied by enumerating the many favours conferred on the English by the Mogul. "Notwithstanding these (fays he) you have interfered in the king's country, possessed yourselves of districts belonging to the government, and turned out and established nabobs at pleasure, without the confent of the imperial court. Since you have imprisoned dependants on the court, and exposed the government of the king of kings to contempt and difhonour; fince you have ruined the trade of the merchants of the country, granted protection to the king a fervants, injured the revenues of the imperial court, and crushed the inhabitants by your acts of violence; and fince you are continually fending fresh people from Calcutta, and invading different parts of the royal dominions; to what can all those wrong proceedings be attributed, but to an absolute diffegard to the court, and a wicked defign of feizing the country to yourselves? If these diffurbances have arisen from your own improper defires, defift from fuch behaviour in future; interfere not in the affairs of government; withdraw your people from every part, and fend them to their own country; carry on the company's trade as formerly, and confine yourselves to commercial affairs," &c. Another letter, much to the same purpose, was fent to Major Carnac; but the prefident and council of Calcutta, inflead of paying any regard to the remonstrances of the nabob, determined to commence an imme-

diate and offentive war against him. Notwithstanding this resolution, several difficulties occurred

Patna taken, and tirely redu English.

occurred in carrying on a war at this time. The principal were the death of Major Adams, whose name had become formidable to the Indians, and the mutinous Sir Hedor disposition of the army. The former was obviated by Munro suc the appointment of Colonel Hector Munro, who, in jor Adams military skill, appeared nothing inferior to his predeceffor; and the mutinous disposition of the foldiery was got the better of by a most fevere example of the mutineers, 24 of whom were blown away from the mouths of cannon. Hostilities were commenced on the part of Meer Coffim, who cut off a fmall party of English troops, and fent their heads to the mogul and Sujah Dowlah. An army of 50,000 men was collected, with a most formidable train of artillery, such as might be supposed to follow an European army of equal numbers. This prodigious armament feems to have effaced all the caution of Meer Coffim; for though he had formerly experienced the bad effects of engaging the English in a pitched battle, yet he now thought proper to try his fortune a fecond time in the fame Defeats the way. The two armies met on the 22d of October 1764 at a place called Buxard, on the river Carumnaffa, about 100 miles above the city of Patna. The event was fimilar to that of other engagements with the English, to whom it never was possible for any advantages either in fituation or number to make the Indians equal. The allied army was defeated with the loss of 6000 killed on the spot, 130 pieces of cannon, a proportionable quantity of military stores, and all their tents ready pitched; while, on the fide of the conquerors, only 32 Europeans and 239 Indians were

107 As repulfed at Chanda Scer.

Indians at

Buxard.

killed, and 57 Europeans and 473 Indians wounded. The only place of strength now belonging to the allies on this fide the river was a fort named Chanda Geer. The reduction of this place, however, might well have been deemed impracticable, as it flood on the top of a high hill, or rather rock, lituated on the very brink of the Ganges, by which it could be constantly fupplied with provisions; and as to military stores, it could not fland in need of any as long as flones could be found to pour down on the affailants. Notwithflanding all those difficulties, however, Colonel Monro kaused his foldiers advance to the attack; but they were received with fuch vollies of stones, which the Indians threw both with hands and feet, that they were repulfed in a very fhort time; and though the attack was renewed the next day, it was attended with no better fuccels: on which the English commander encamped with his army under the walls of Benares.

Soon after this, Colonel Munro being recalled, the command of the army devolved on Sir Robert Fletcher, a major in the company's troops. The nabob in the mean time, inflead of attacking the English army at once, contented himfelf with fending out parties of light horse to skirmish with their advanced posts, while the main body lay at the diffance of about 15 miles from Benares, which rendered it very dangerous for them to move from their place. On the 14th of January 1765, however, Sir Robert ventured at midnight to break up his camp under the walls of Benares, and to march off towards the enemy, leaving a party to protect that place against any attempt during his absence. In three days he came up with the main body of Indians, who retreated before him; on which he refolved to make another attempt on Chanda Geer,

before which the late commander had been foiled. India, His fuccess would in all probability have been no better than that of his predecessor, had not the gativion Chanda mutinied for want of pay, and obliged the commander Geer taken to furrender the place. by Sie Ro-

The reduction of Chanda Geer was followed by bert Fletthat of Eliabad, the capital of the enemy's country, a cher. large city on the Ganges, between 60 and 70 miles above Chanda Geer, defended by thick and high walls and a strong fort; foon after which Sir Robert was feperfeded in the command of the army by Major Carnac. Sujah Dowla in the mean time had been Sujah Dowabandoned by the Mogul, who concluded a treaty laailifted by with the English soon after the battle of Buxard. He rattas. did not, however, give himfelf up to despair, but gathered together, with great affiduity, the remains of his routed armies; and feeing that his own territories could not fupply him with the requifite number of troops, he now applied to the Mahrattas for affiliance. But these people, though very formidable to the other nations of Indoltan, were far from being able to cope with the English. On the 20th of May 1765, Gene- Who are ral Carnac having affembled his troops, marched im-defeated, mediately to attack them; and having gained a com- and Sujah plete victory at a place called Calpi, obliged them to fubmits, retreat with precipitation across the Yumna into their own country.

Sujah Dowla, now destitute of every resource, determined to throw himself on the clemency of the English. Previous to this, however, he allowed Meek Coffim and the affaffin Somers to escape; nor could any confideration ever prevail upon him to deliver them up. Three days after the battle of Calpi, the nabob furrendered himfelf to General Carnac, without stipulating any thing in his own favour, farther than that he should await the determination of Lord Clive con-

cerning him.

In the beginning of February this year died Meer Young na-Jaffier Ali Cawn, nominal nabob of Bengal. The bob of Benfuccession was disputed betwirt his eldest surviving fon tied by the Najem il Doula, a youth of about 18 years of age, and English. a grandfon by his eldeft fon Miran, at that time only feven years old. As the English were in reality absolute fovereigns of the country, it was debated in the council of Calcutta whether Meer Jaffier's fon should be allowed to fucceed, according to the cuftom of the country, or the grandfon, according to the English custom. The point being carried in favour of Najem, it was next debated on what terms he should be admitted to the fuccession. The late nabob, among other impositions, had obliged himself to support an army of 12,000 horse and as many foot. It was alleged on this occasion, that he had not fulfilled his engagement; that he had disbanded most of the troops; that at best they were but an useless burden, having never answered any purpose in real fervice, for which reason the company had been obliged to augment their military establishment; it was therefore now judged expedient that the nabob should settle a fum, upwards of 800,000 l. annually, on the company, to be paid out of the treafury; that he should alfo discard his prime minister and great favourite Nuncomar, and receive in his place a person appointed by the council, who was to act in the double capacity of minister and governor to assist and instruct him.

The council were also to have a negative upon the nomination of all the funerintendants and principal officers employed in collecting or receiving of the revenues; that he should take their advice, and have their confent to fuch nominations whenever they thought proper to interfere in them. He was also to receive their complaints, and pay a due attentiou to them upon the milbehaviour of any of the officers who either were appointed already or should be in time to come.

With these extravagant requisitions the young nabob was obliged to comply, though he had difcernment enough to perceive that he was now an absolute flave to the council of Calcutta. Though obliged by treaty to difmifs Nuncomar from the office of prime minister, he still continued to show him the same favour, until at last he was charged with carrying on a treasonable correspondence with Sujah Dowla, for which the nabob was enjoined to fend him to Calcutta to take his trial. The unfortunate prince used every method to deliver his favourite from the impending danger, but to no purpose: he was obliged to submit to the mortification of having all his offers with regard to his release rejected, though the committee at Calcutta afterwards thought proper to fet him at liberty without

any trial. These extraordinary powers, exerted in such a def-

Bengal

with un-

potic manner by the council of Calcutta for fuch a length of time, could not but at last induce their superiors to circumferibe them in fome degree, by appointing others who should act independently even of this council, and who might be supposed to be actuated by more upright and honourable principles than had hitherto appeared in their conduct. The great character which Lord Clive had already gained in the eaft, juftly marked him out as a proper person for adjusting the Lord Clive affairs of Bengal. On the 3d of May 1765 he arrived in the east, with full powers as commander in chief, prefident, and governor of Bengal. An unlimited power was also committed to a select committee, consisting of his lordship and four gentlemen, to act and determine every thing themselves, without dependence on the council. It was, however, recommended in their inftructions, to confult the council in general as often as it could be done conveniently; but the fole power of determining in all cases was left with them, until the troubles of Bengal should be entirely ended. By these gentlemen a plan of reformation was instantly fet about; by which, however, violent disputes were occafioned; but the committee, difregarding these impotent efforts, exerted their authority to the full extent, feldom even acquainting the council with their transactions, and never allowing them to give their opinion on any occasion.

On taking the affairs of Bengal into thorough con-Sujah Dowla restored. sideration, Lord Clive found that the success of the British arms could be productive of nothing but wars; that to ruin Sujah Dowla was to break down the strongest barrier which the Bengal provinces could have against the incursions of the Mahrattas and other barbarous people to the westward, who had long desolated the northern provinces; and the Mogul, with whom the compay had concluded a treaty, was utterly unable to support himself, and would require the whole English lordship therefore found it necessary to conclude a Hyder Aly.

treaty with Sujah Dowla. The Mogul was fatisfied India. by obtaining a more ample revenue than he had for fome time enjoyed; by which means he might be ena- Affairs of bled to march an army to Delhi to take possession of Bengal fethis empire. For the company his lordship obtained tled b the office of duan or collector of revenues for the Lord Clive province of Bengal and its dependencies. Thus Suigh Dowla was again put in possession of his dominions, excepting a fmall territory which was referved to the Mogul, and estimated at 20 lacks of rupees, or 250,000 l. annually. The company were to pay 26 lacks of rupees, amounting to 325,000 l. Sterling, They engaged also to pay to the nabob of Bengal an annual fum of 53 lacks, or 662,500l. for the expences of government, and the support of his dignity. The remainder of the revenues of Bengal were allotted to the company, who on their part quaranteed the territories at that time in possession of Sujah Dowla and the Mogul.

Thus the East India company acquired the fovereignty of a territory equal in extent to the most flour rishing kingdom in Europe. By all this, however, they were fo far from being enriched, that the diforder of their affairs attracted the attention of government, and gave the British ministry an opportunity at last of depriving them of their territorial poffessions, and subjecting the province of Bengal to the authority of the crown *. New misfortunes also speedily occurred, and ' See Eag's the company found a most formidable enemy in Hyder India Com-Aly, or Hyder Naig. This man, from the rank of a pany. common sepoy, had raised himself to be one of the War with most considerable princes in the empire of Indostan, Hyder Aly Being sensible that the power of the English was an insuperable bar to his ambitious designs, he practised on the nizam of the Decan, and partly by promifes partly by threats, engaged him to renounce his alliance with the company, and even to enter into a war against them. As he had been at great pains to introduce the European discipline among his troops, and had many renegadoes in his fervice, he imagined, that with the advantage of numbers he should certainly be able to cope with his antagonifts in the open field. In this, however, he was deceived; for on the He is de-1 26th of September 1767, his army was entirely defeat-feated by ed by colonel Smith at a place called Errour near Tri- Smith. nomallee; after which the nizam thought it advisable to defert his new ally, and conclude another treaty with the English. From the latter, however, he did not obtain peace but at the expence of ceding to them the Duanny of the Balegat Carnatic, which includes the

dominions of Hyder Aly and fome petty princes. Hyder, thus deferted by his ally, transferred the feat of war to a mountainous country, where, during the year 1767, nothing decifive could be effected; while the Indian cavalry was fometimes enabled to cut off the supplies, and interrupt the communications of their antagonists. During these operations some ship were fitted out at Bombay, which conveyed 400 European foldiers and about 800 fepoys to attack Mangalore, one of Hyder Aly's principal fea-ports, where all his fhips lay. This enterprize proved fuccefsful, and nine ships were brought away; but too small a garrison having been left in the place, it was almost immediately power in the east to secure him in his dignity. His after retaken, and all who were in it made prisoners by

Decline of the E g-lift affaire, with the caufe of their bad fuccess.

In the mean time, an injudicious measure, adopted by the English in their method of managing the army, proved not only of the utmost detriment to their cause, but occasioned difgraces hitherto unheard of in the hiflory of the nation, viz. the defertion of officers from the service of Britain to that of a barbarous prince, and the giving up of forts in fuch a shameful manner as could not but fuggest a suspicion that they had been betrayed .- The original cause of all this mischief was the appointment of field deputies to attend the army, and to control and superintend the conduct of the commander in chief; and thefe, in the prefent instance, being deeply concerned in the contracts for the army, took care to regulate its motions in fuch a manner as best fuited their private interest or convenience. Hyder Aly did not fail to improve the errors confequent upon this kind of management to his own advantage. General Smith had penetrated far into his country, taken feveral of his fortreffes, and was in a fair way of becoming mafter of his capital, when all his operations were checked at once by the field-deputies. His antagonist being thus allowed some respite, suddenly entered the Carnatie with a numerous army of horfe, ravaging and deftroying every thing at pleasure. Thus the English were obliged to relinquish all their conquests in order to defend their own territories; while this reverse of fortune not only discouraged the allies of the English, but even prodused in them an inclination to defert their cause, and go over to Hyder Aly, while those who remained faithful paid dearly for their attachment. The nabob of Arcot, the most faithful ally the English ever had, fusfered ex-tremely on this occasion. Hyder Aly had long entertained a violent enmity against this prince; most probably on account of his inviolable attachment to the English. His dominions were therefore ravaged without mercy; and thus, while Hyder gratified his perfo-nal refentment against him, he cut off from the English one of the principal refources they had for carrying on the war.

On the return of the company's forces to the defence of the Carnatic, they found themfelves very little able to cope with their adverfary; for, befides the continuance of the fame caufes which had formerly contributed to their want of fuccefs, they had been very much weakened in their expedition. Hyder Aly had all ot he prudence to avoid a general-engagement, but frequently intercepted the convoy of the English, cut off their detached parties, and wearied them out with long and continual marches. The news of his fuccefs againft an enemy hitherto invincible by all the powers of India, for raifed his reputation, that adventurers flocked to him from all parts; by which means his eavalry were foon increased to-upwards of 90,000; to which, however, his infantry bore no proportion.

Notwithfunding all his fuccefs, it appears that the forces of Hyder Aly were altogether unable to cope with those of Britain, even when there was the greatest imaginable disparity of numbers. A detachment of the company's forces had made an affault upon a fort called Bulwaggtle, in which they were repulled with form tofs. This, with the fmall number of the detachment, encouraged Hyder Aly to march, at the head of a great part of his army, to the protection of the fort. The commanding officer, however, Colonel Wood, did not hefitate, with only 460 Europeans and

2300 sepoys, to attack this army, confifting of 14,000 India. horse, 12,000 men armed with matchlock guns, and fix battalions of fepoys. The engagement lasted fix Hyder Ale hours; when at last Hyder Aly, notwithstanding his defeated by numbers, was obliged to retreat; leaving the field co-Colonel vered with dead bodies; the lois of the British being Wood. upwards of 300 killed and wounded. This engagement, however, was attended with no confequences affeeting the war in general, which went on for fome time in the fame manner, and greatly to the difadvantage of the company. The divisions and discontents among the officers and council daily increased, the foldiers deferted, and every thing went to ruin. The revenues of the establishment of Madras being at last unequal to the expences of the war, large remittances were made from Bengal to answer that purpose; and as thele were made in a kind of base gold coin, the company is faid by that means alone to have loft 40 cool, in the difference of exchange only. At last Hyder Aly having given the English army the slip, suddenly appeared within a few miles of Madras; which occationed fuch an alarm, that the prefidency there were induced to enter into a negociation with him. The Indian prince, on his part, was very ready to hearken to propofals of peace upon any reasonable terms. An offensive and A treat defensive treaty was therefore concluded on the 3d of concluded April 1760, on the simple condition that the forts and with him. places taken on both fides should be restored, and each party fit down contented with their own expences.

By this treaty it was particularly flipulated, that in Broken by case of either party being attacked by their enemies, the Engthe other should give them assistance; and in this case lish. even the number of troops to be fupplied by each was specified. It soon after appeared, however, that the prefidency of Madras were refolved to pay very little regard to their engagements. Hyder Alv having in a little time been involved in a war with the Mahrattas. applied for affiftance, according to agreement; but was refused by the presidency, who pretended to fear a quarrel with the Mahrattas themselves. As the latter are a very powerful and warlike nation, Hyder Aly found himself overmatched, and therefore applied feveral times to the English for the affistance he had a right to expect; but was contlantly refused on various pretences: which convinced him at last that he could place no dependence on the friendship of the English, and filled him with an implacable hatred against them. As foon, therefore, as he could make up his differences with the Mahrattas, he refolved to recover his loffes. and revenge himself on those faithless allies. With this view he applied himself to their rivals the French; whom no Indian nation ever found backward in fupplying them with the means of defence against the English. By their means he obtained military flores in the greateft; abundance, a number of experienced officers and foldiers; and the European discipline was brought to. much greater perfection than even be himfelf had ever been able to bring it before this period. Thus, in a fhort time, imagining himfelf a match for the Mahrattas, he renewed the war; and gained fuch decitive advantages, as quickly obliged them to conclude an adyantageous treaty with him.

It now appeared that the English, notwithstanding War betheir pretended ill-will to quarrel with the Mahrattas, twen the had not the least hefitation at doing so when their interest. Mahrattasterest.

fequent transactions, however, we must observe, that and experience in war, the Mahrattas, like other nations of Indoftan, were a right to affemble the chiefs, and order out their and prepared to lay fiege to the capital. It being now ly poffessed by the paishwa or chancellor. This office Gumeroponda, about 28 miles from Madras, to probeing usurped by one particular family, Nana-row, the ceed from thence directly to Conjectram with the corps reigning pailtwa, feized the ram-rajah, and confined under his command, where the main body was to meet predeceffor of Moodagee Boofla, rajah of Berar, was dras. Colonel Baillie. therefore, after some proper manœuvres, caused his troops form a line, while the enemy cannonaded them inceffantly with great execution. On this Colonel Baillie detached Captain Rumley with five companies of fepoy grenadiers to ftorm their guns; which fervice they would have undoubtedly accomplished, had not their march been interrupted by a torrent of water which at that time happened to be unfordable. Captain Rumley therefore returned about half an hour after cleven, when the guns of the enemy were heard drawing off towards the English front, and a general alarm was perceived throughout their camp; owing, as was supposed, to their having received intelligence of the party that had been fent to florm their guns. " From their noise, confusion, and irregular bring (fays our author), one would have imagined that a detachment of our men had fallen upon them with fixed bayonets. At that critical moment, had a party of grenadiers been fent against them, they would have routed without difficulty the whole of Tippoo's army. Having about ten o'clock in the evening advanced a few hundred yards into an avenue, the detachment remained there in perfect filence till the morning.

"Colonel Fletcher being asked by some officers, why Colonel Baillie halted? modefly answered, that Colonel Baillie was an officer of established reputation, and that he no doubt had reasons for his conduct. It cannot, however, be concealed, that this halt afforded an opportunity for Tippoo Saib to draw off his cannon to a very strong post by which the English were obliged to pass; and at the same time of informing Hyder of their fituation, and fuggesting to him the expediency of advancing for the improvement

of fo favourable a conjuncture.

"On the 10th of September, at five o'clock in the morning, our little army marched off by the right in fubdivitions, having their baggage on their right flank and the enemy on their left. A few minutes after fix two guns opened on their rear, on which the line halted a few minutes. Large bodies of the enemy's cavalry now appeared on their right flank; and just at the moment when the pagoda of Conjeveram appeared in view, and our men had begun to indulge the hopes of a respite from toils and dangers, a rocket boy was taken prisoner, who informed them, that Hyder's whole army was marching to the affiftance of Tippoo. Four guns now opened on their left with great effect. So hot was the fire they fuftained, and fo heavy the lofs, that Colonel Baillie ordered the whole line to quit the avenue, and prefent a front to Rumley with ten companies of fepoy grenadiers to numbers of officers and men, they remained from half ftorm the enemy's guns.

"Within a few minutes after Captain Rumley had left the line Tippoo's guns were filenced. Rumley's little detachment immediately took poffession of four of the enemy's guns, and completely routed the party attached to them. Captain Rumley, overcome with fatigue, ordered Captain Gowdie, the officer next in command, to lead on the party, and take poffession of Is attacked fome more guns placed a few hundred yards in their front. But in a few minutes after, as they were advancing for this purpofe, a fudden cry was heard a-

ers, whose numbers were nearly five to one of the troops under arms, were driven on a part of our line by the numerous and furrounding forces of Hyder Aly; who being informed of the embarraffing fituation of Colonel Baillie, had left his camp without firiking his tents, with a view to conceal his march from the English. A great confusion among our troops was the unavoidable confequence of this fudden onfet. The Europeans were fuddenly left on the field of action alone: and at that critical moment a detachment from the advanced guard of Hyder's army preffed on with great celerity between our line and Captain Rumley's party. The commanding officer, therefore, apprehensive of being cut off from our little army, judged it most prudent to retreat.

"Colonel Baillie, when he was informed that an immense body of horse and infantry was marching towards him, and that this was supposed to be Hyder's main army, faid, 'Very well, we shall be prepared to receive them.' Hyder's whole forces now appeared incontestably in view; and this barbarian chief. who, as was observed of the Roman general by Pyrrhus, had nothing barbarous in his discipline, after dividing his guns agreeably to a preconcerted plan, opened from 60 to 70 pieces of cannon, with an innumer-

able quantity of rockets.

"Hyder's numerous cavalry, supported by his regular infantry and European troops, driven on by threats, encouraged by promifes, and led on by his most diftinguished officers, bore on our little army in different quarters without making the least impression. Our men, both Europeans and sepoys, repeatedly prefented and recovered their fire-arms as if they had been manœuvring on a parade. The enemy were re- Gallant beat pulsed in every attack; numbers of their best cavalry havrour of were killed, and many more were wounded; even their infantry were forced to give way; and Hyder lift. would have ordered a retreat, had it not been for the advice of General Lally, who informed him that it was now too late, as General Munro was most probably advancing on their rear from Conjeveram; for which reason nothing remained but to break the detachment by their artillery and cavalry.

" Tippoo Saib had by this time collected his party together, and renewed the cannonade; and at the same time that the English were under the necessity of suftaining an attack both from the father and fon, two of their tumbrils were blown up by Hyder's guns, and a large opening made in both lines. They had now no other ammunition than grape; their guns discontinued firing: and in this dreadful fituation, under a the enemy; and at the fame time difpatched Captain terrible fire not only of guns but rockets, lofing great

past seven till nine o'clock.

"On this Hyder Aly, perceiving that the guns were quite filenced, came with his whole army round their right flank. The cavalry charged them in diftinct columns, and in the intervals between these the infantry poured in vollies of musketry with dreadful effect. Mhiar Saib, with the Mogul and Sanoor cavalry, made the first impression. These were followed They are by the elephants and the Myforean cavalry, which completed the overthrow of the detachment. Colonel Bail. feated. lie, though grievously wounded, rallied the Europeans.

126 my.

neans, and once more formed them into a fourre and my's cavalry to break this fmall body of men; but by lidia with this handful of men he gained an eminence, where, without ammunition, and most of the people wounded, he refifted and repulled 13 feparate attacks; but fresh bodies of cavalry continually pouring in, they were broken without giving way. Many of our men, desperately wounded, raising themselves from the ground

received the enemy on their bayonets.

" Captain Lucas's battalion of fepoys, at the time when our men moved up to a rifing ground, was ftationed to the right of the European grenadiers; but that corps, feeing the Europeans in motion, and mifunderstanding perhaps this evolution for a retreat, broke in the utmost confusion. The Europeans, bravely fuftaining their reputation for intrepid valour, remained in this extremity of diffrefs fleady and undaunted, though furrounded by the French troops, and by Hyder's cavalry to the number of 40,000. They even expressed a delire, though their number did not exceed 400, of being led on to the attack. A party of Topaffes, who lay at the distance of about 30 yards in our front, kept up an incessant fire of small arms with great effect. Many attempts were made by the enethe fleady conduct of both our officers and men they were repulfed.

" Colonel Baillie, finding that there was now no prospect of being relieved by General Munro, held up a flag of truce to one of the chiefs of Hyder's army. But this was treated with contempt, and the furdar endeavoured at the fame time to cut off the colonel. The reafon the enemy affigned for this was, that the fepoys had fired after the figural was hoisted. A few minutes after this, our men received orders to Throw lay down their arms, with intimation that quarter down their would be given. This order was fearcely complied arms, but are cruelly with, when the enemy rushed in upon them in the red. most favage and brutal manner, sparing neither age nor infancy nor any condition of life; and, but for the humane interpolition of the French commanders Lally and Pimoran, who implored and infifted with the conqueror to flow mercy, the gallant remains of our little army must have fallen a facrifice to that favage thirst of blood with which the tyrant difgraced his victory."(A)

In this unfortunate action near 700 Europeans were

(A) In a narrative of the fufferings of the English who furvived this fatal day, faid to be published by an officer in Colonel Baillie's detachment, we find it related, that "Hyder Aly, scated in a chair in his tent, enjoved the fight of the heads of the flain, as well as of his prifoners. Colonel Baillie, who was himfelf very much wounded, was brought to his camp on a cannon, and with several other gentlemen in the same situation laid at the tyrant's feet on the ground and in the open air. In this fituation they faw many of the heads of their countrymen presented to the conqueror, some of them even by English officers, who were forced to perform that horrid task; in a little time, however, Hyder ordered no more heads to be brought to him while the English gentlemen were present. A tent was fitted up for Colonel Baillic and his officers, but without flraw or any thing elfe to be upon, though many of them were dangerously wounded; and as the tent could only contain 10 perfons, the reit were obliged to lie in the open air. When the prifoners were removed from place to place, they were wantonly infulted, and even beaten by those who had the charge of them. If the latter halted to refresh themselves under a tree, they would be at the trouble of carrying their prisoners to the fide next the fun, left they should enjoy the benefit of the shade. Sometimes they were tormented with thirst, at others the people allowed them to drink water out of the palms of their hands, it being reckoned a profanation to allow an European to tirink out of a veffel belonging to an Indian," &c.

In this narrative are likewife mentioned fome examples of a recovery from wounds, which, if we can depend on their authenticity, must undoubtedly show a restorative power in the human body altogether unknown in this

"Lieutenant Thomas Bowfer received a mufket ball in his leg, and after that eight desperate wounds with a fevmitar. He lay for feven hours on the fpot, deprived of all fentation; but, towards evening, awakened from his trance, fripped of all his clothes, except a pair of under drawers and part of his shirt, with an intenfe thirft, calling out, and imploring a little water from the enemy. Some were moved with compaffion, while others answered his intreaties only with infults and threats of immediate death. Some water, however, was brought from a pool in the field of battle, about 50 or 60 yards from the place where he lay. It was deeply tinged with blood; nevertheless, Mr Bowfer being furnished by one of Hyder's foldiers with an earthen chatty, or pot containing about a pint, and directed to the place, crawled thither as well as he could. Though fruck with horror at the fight of the dead and wounded with which it was filled, he quenched his thirst with the liquid; and having filled his chatty, endeavoured to proceed towards Conjeveram. He had not, however, moved from his place above 300 or 400 yards, when, being quite overcome, he was obliged to lie all night in the open air, during which time there fell two heavy showers of rain. Next morning he proceeded to Coneveram : but after walking about a mile, was met by fome of the enemy's horsemen, by whom he was brought back priloner, and obliged to walk without any affiftance. When delivered up to the enemy's fepoys, he was fo fliff with his wounds, that he could not floop or even bend his body in the fmallest degree,

" The quarter-maîter ferjeant of artillery received fo deep a cut across the back-part of his neck, that he was obliged to support his head with his hands in order to keep it from falling to a fide all the journey. The least shake or unevenness of the ground made him cry out with pain. He once and again ceased from all attempts to proceed; but being encouraged and conjured by his companions to renew his efforts, he did fo, reached the camp, and at laft, as well as Mr Bowfer, recovered."—It is also remarkable, that, according to our author, out of 32 wounded perfons only fix died; though one would be apt to think that the exceffively

fevere usage they met with would have killed every one.

Sir Eyre

mand of

Inilia. killed on the fpot : the lofs on Hyder Aly's part was His army amounted to 200,000 men, 40,000 of whom fo great that he industriously concealed it, being enraged that the conquest of such an inconsiderable body should cost him so many of his bravest troops. He feemed ever after to confider the English with an extreme degree of terror; infomuch that, notwithstanding his pretended exultation on account of the prefent victory, he no fooner heard a report of Sir Hector Munro's march to attack him, than he left his camp in the utmost confusion, abandoning great part of his tents and baggage, as well as the vast numbers that had been wounded in the late action.

On the news of Colonel Baillie's difaster, the fu-Chote appreme council of Bengal requested Sir Ayre Coote pointed to to take upon him the management of the war; for the the comcarrying on of which a large supply of men and money the army. was inflantly decreed. This was readily undertaken by the illustrious officer just mentioned, notwithstanding his very precarious state of health at that time; and from the moment he took upon him the management

> of affairs, the fortune of the war was changed. The spirit of diffention, which for a long time had infected the prefidency of Madras, was indeed the true cause of all the misfortunes that had happened. This was found by Sir Eyre Coote to be even greater than he had heard by report : the refpect and confidence of the natives was wholly loft; the complaints of the officers and foldiers were loud and acrimonious; an inactivity prevailed in all the councils and operations, while the enemy carried every thing before them. Sir Hector Munro had been greatly haraffed on his march to Madras, whither he had retreated after Colonel Baillie's difafter; the forces of Hyder Aly had infested all the places in that neighbourhood in such a manner as in a great measure to cut off all supplies : and Arcot, the capital city of the most faithful ally the British ever had, was taken by storm, together with an adjoining fort, by which means an immense quantity of ammunition and military flores fell into the hands of the enemy.

> No fooner had Sir Evre Coote taken upon him the command of the British forces, than his antagonish thought proper to change his plan of operations entirely. He now detached large parties of his numerous forces to lay fiege to the principal fortreffes belonging to the company; while, with the bravest and best disciplined part, he kept the field against the British commander in person. On the very first appearance of the British army, however, his resolution failed, and he abandoned the fiege of every place he had invested, retiring to a confiderable diffance on the other fide of the river Palaar, without even disputing the passage of it, as it was expected he would have

A respite being thus obtained from the incursions of this formidable enemy, the next operation was to fecure Pondicherry, whose inhabitants had revolted. They were, however, eafily difarmed, their magazines feized, and all the boats in their possession destroyed; in consequence of which precaution, a French fquadron that foon after appeared off Pondicherry was obliged to depart without being furnished with any necessaries. But in the mean time Hyder Aly having drawn large reinforcements from all parts of his domigions, refolved to try his fortune in a pitched battle. avenues to the place were defeated at the very first Nº 166.

were cavalry and 15,000 well disciplined sepoys. Still, however, he durft not openly attack the British army in the field, but took a ftrong post from whence he might harafs them on their march. Sir Eyre Coote. however, was not on his part backward to make the ettack; and on the other hand Hyder Aly prepared to engage him with all possible advantage. The battle was fought on the Ist of July 1781; and notwithstanding the vast superiority of Hyder Aly's army, he was routed with great flaughter. The Indians, Defeats however, made a much more obstinate resistance than Hyder Alva usual; the engagement lasted from nine in the morning till four in the afternoon, and the deficiency of the English in cavalry prevented them from pursuing the advantage they had gained.

Notwithstanding the loss of this battle, Hyder Alv Gains a fee was foon encouraged to venture another. This was cond victsfought on the 27th of August the same year, on the ry. very fpot where Colonel Baillie had been defeated. It was more obstinately contested than even the former. being continued with great fury from eight in the morning to near dusk. A number of brave officers and foldiers fell on the part of the British, owing chiefly to the terrible fire of the enemy's artillery and the advantageous position of their troops. At last, however, the Indian army was totally defeated, and driven from every post it had occupied; though from the obstinate resistance made at this time, Hyder began to entertain hopes that his forces might, by a fuccession of fuch battles, be at last enabled to cope with the English. He therefore ventured a third battle in Hyder defome weeks after, but was now defeated with greater feated a lofs than before. Undifcouraged by this bad fuccefs, third time. however, he laid fiege to Vellore; and expecting that the relief of it would be attempted, feized a ftrong pass through which he knew the British army must direct their march. The British commander accordingly advanced, and found the enemy in possession of fome very strong grounds on both sides of a marsh through which he was obliged to pass. Here he was attacked on all fides, but principally on the rear, the enemy directing their force principally against the baggage and convoy of provisions defigned for the garrison. Their utmost efforts, however, were unsuccelsful, and Sir Eyre Coote forced his way to Vellore in fpite of all opposition Hyder Aly did not fail to wait his return through the same pass; and having exerted his utmost skill in posting his troops, attacked him with the utmoft vigour; but though the English A fourth were affaulted in front and in both flanks at once, and victory a heavy cannonade kept up during the whole time of gained by the engagement, the Indians were at last defeated with lift. great flaughter.

By these successes the presidency of Madras were now allowed fo much respite, that an enterprise was planned against the Dutch settlement of Negapatam, fituated to the fouth of Madras, and in the neighbourhood of Tanjour. A very inconfiderable force, however, could yet be spared for this purpose, as Hyder Aly, though to often defeated, was still extremely formidable. Sir Hector Munro had the management Dutch fetof the expedition : and fo furious was the attack of tiement of the British failors, that the troops left to guard the reduceds

Pondicherxy revolts, but is quickly aeduced.

India.

comale.

onfet. was of very fhort duration, a breach being foon made, and the garrison furrendering prisoners of war.

And like-wife Trin-The lofs of Negapatam was quickly followed by that of Trincomale. Admiral Hughes, who had conveyed Sir Hector Munro with the land forces to that place, and affifted him with his failors, immediately after its furrender fet fail for Trincomale, where he arrived about the middle of January 1782. The fort of that name was quickly reduced; but the main frenoth of the fettlement confifted in a fort named Oftenburgh, the principal place on the island, and by the capture of which the whole fettlement would be reduced. This fort stands on a hill which commands the harbour, but is itself overlooked by another hill at the diffance of no more than 200 yards. Though the gaining of this post was undoubtedly to be attended with the lofs of the fort, it does not appear that the governor even attempted to defend it. A British de-tachment of failors and marines therefore took possesfion of it, when the admiral fent a fummons of furrender, representing the inutility of making any farther defence after the loss of such a post; and being extremely defirous of avoiding an effusion of blood, re-peated his arguments at feveral different times. The governor, however, proving obtlinate, the place was taken by ftorm, with the lofs of about 60 on the part of the British, and very little on that of the Dutch, the victors giving quarter the moment it was asked. Four hundred Europeans were taken prisoners; a large quantity of ammunition and military stores, with a numerous artillery, were found in the place; and two Indiamen richly laden, with a number of fmall trading

veffels, were taken in the harbour.

738 A more formidable enemy, however, now made his Suffrein a appearance on the coast of Coromandel. This was rives with a Suffrein the French admiral; who fetting out from his native country with 11 ships of the line and several flout frigates, had fallen in with the Hannibal of 50 guns, and taken her when separated from her consorts. This ship, along with three others, a 74, a 64, and a 50, had been fent out to the affiftance of Sir Edward ; and the three last had the good fortune to join him before the arrival of M. de Suffrein. The latter, fupposing that he had not yet received this reinforcement, bore down upon the English squadron at Madras, to which place they had failed immediately after the capture of Trincomale. Perceiving his miftake, however, he inflantly bore away. The English admiral purfued, took fix veffels, five of them English prizes, and the fixth a valuable transport laden with gunpowder and other military ftores, besides having on board a number of land-officers and about 300 regular troops. This brought on an engagement, in which M. Suffrein, perceiving the rear division of the British fleet unable to keep up with the reft, directed his force principally against it. The ships of Admiral Hughes himself and Commodore King sustained the most vioand ir Ed-lent efforts of the French, having mostly two, and fometimes three, veffels to contend with. Thus the commodore's ship was reduced almost to a wreck; but about fix in the evening, the wind becoming more favourable to the English, the squadron of the enemy part of the British amounted to little more than 130 soon as a junction was formed, they proceeded, under Vol. IX. Part I.

A regular fiege enfued; which, however, killed and wounded, but that of the French exceeded India.

After the battle Sir Edward returned to Madras: but meeting with no intelligence of Suffrein at that place, he made the best of his way for Trincomale, being apprehensive of an attack upon that place, or of the intercepting of a convoy of stores and reinforcements at that time expected from England. Suffrein had indeed got intelligence of this convoy, and was at that time on his way to intercept it. This brought the hostile seets again in fight of each other; and as the British admiral had been reinforced by two ships of the line, he was now better able to encounter his adverfary. A desperate battle ensued, which conti-

nued till towards night, when the ships on both sides battle. were fo much shattered, that neither could renew the

engagement next day.

Though these engagements produced nothing decifive, they were nevertheless of the utmost prejudice to the affairs of Hyder Aly, who was thus prevented from receiving the fuccours he had been promifed from France; and he was still farther mortified by the defeat of his forces before Tellicherry, which place he Hyder had blocked up fince the commencement of hostilities. Aly's forces This last misfortune was the more sensibly felt, as an Tellichery. open passage was now left for the English into those countries best affected to Hyder. His bad fuccess here, however, was in fome measure compensated by the entire defeat of a detachment of about 2000 English infantry and 300 cavalry under Colonel Braith-Colonel waite, a brave and experienced officer. This detach-Braithment, confifting of chofen troops from Sir Eyre Coote's waite's dearmy, lay encamped on the banks of the Coleroon, tachment which forms the northern boundary of Tanjour. Tip-cut off by poo Saib having procured exact intelligence of the fi-Tippoo tuation of this party, formed a defign of attacking it while no danger was suspected on account of the distance of Hyder Aly's army. He fet out on this defign with an army of 15,000 horse and 5000 foot. accompanied by a body of French regulars; and having croffed the Coleroon, fuddenly furrounded the British forces on all fides. The colonel, perceiving his danger, formed his men into a square, diltributing the artillery to the feveral fronts, and keeping his cavalry in the centre. In this fituation he refilted for three days the utnioft efforts of his numerous enemies, always compelling them to retreat with great lofs. At last General Lally, rightly conjecturing that the strength of the English must be exhausted and their numbers thinned by fuch desperate service, proposed that the French infantry, which was fresh and entire, should attack one of the fronts of the square, while the forces of Tippoo should do the same with the other three. This last attack proved successful; the British forces were broken with great slaughter, which however was stopped by the humanity of the French commander; who even obtained from Tippoo Saib the care of the prisoners, and treated them with a tenderness and humanity they certainly would not otherwise have experienced. A number of British officers, however, perished in the engagement, and only one remained unwounded.

In the mean time, the fuccours from France, fo Cuddalore! were obliged to draw off. The loss of men on the long expected by Hyder, made their appearance. As taken.

ceiving that the march of the British troops was thro' below, while his numerous cavalry attacked them the English was very manifest; and in entering the on every fide. Notwithstanding all disadvantages, harbour of Trincomale the French lost a 74 gun the British commander at last closed in with the ship. enemy; and after an obflinate dispute completely routed them. Neither this, however, nor any other engagement with Hyder Aly, ever proved decifive; for as the want of cavalry prevented the British general from purfuing his advantage, fo that of his antagonist was so numerous, that by it he always covered his retreats in such an effectual manner as to lose but sew men, and in a short time to be in a condition to act again on the offenfive. This was remarkably the cafe at prefent; for notwithstanding this defeat, which happened on the 2d of June 1782, he cut off an advanced body of the British army five days after; and harassed the whole in fuch a manner, that Sir Eyre Coote, notwithstanding his success, was obliged to move nearer Madras : foon after which, he was obliged, on account of his bad state of health, to relinquish the command of the army to General Stuart.

attended with no fuccess by land, began to rest his hopes on the fuccess of the French by sea. He therefore earnestly requested M. Suffrein, who possessed at that time a decilive superiority in the number of ships, to lofe no time in attacking the British squadron before it could be joined by a reinforcement which was A third fea- then on its way, and was reported to be very formifight, great dable. In like manner fome conducted, that Sir Edward received no intelligence other places of smaller consequence were reduced, un- of the danger, till a British frigate chasing a French til at last being joined by Hyder's numerous forces, one, which took shelter with the squadron at Trincothey determined to lay fiege to Vandervash, a place of male, discovered it by this accident, and hastened back great importance, and the lofs of which would have with the news to Madras. It was now, however, too been extremely detrimental to the English. This late; the place was not in a condition to resist a siege; Who nequickly brought Sir Eyre Coote with his army to its and the French batteries having filenced those of the vertheless relief: but Hyder Aly, notwithstanding his being re- fort in two days, a capitulation took place on the last take Trins

Sir Edward Hughes having been detained by conceeded to attack Arnee, the principal deposit of Hy- trary winds, did not arrive at Trincomale before the der's warlike stores and necessaries. Thus the latter 2d of September, when he had the mortification to see was obliged to quit his advantageous ground; but he the forts in the hands of the French, and that Suffrein did fo with fuch fecrecy and fpeed, that he came upon was in the harbour with 15 fail of the line while he the British army unawares while preparing for its last had only 12. He did not hesitate at venturing frein decline the combat. The event of the battle was no tween the time by Sir low grounds, encompassed on most parts with high other than shattering the siccets and killing and wound- French and Eyre Coote hills, he planted his cannon upon the latter; from ing a number of men on both fides. In this, however, English which he kept a continual and heavy fire on the troops as well as in the other engagements, the fuperiority of fleets.

> The lofs of Trincomale was feverely felt by the English; for while the French lay fafely in the harbour refitting their fquadron, the English were obliged for English that purpose to fail to Madras. Here the fleet was fleet that affailed by one of the most dreadful tempests ever tered by a known on that coast. Trading vessels to the number dreadful of near 100 were wrecked, as well as those for Madras tempest. laden with rice, of which there was an extreme fcarcity at that place. Thus the scarcity was augmented to a famine, which carried off valt numbers of the inhabitants before supplies could arrive from Bengal. The continuance of the bad weather obliged Sir Edward with his whole fquadron to fail to Bombay; and there he did not arrive till towards the end of the year, when his fquadron was fo much shattered, that, in order to repair it with proper expedition, he was obliged to difiribute it between the dock-yards of Bombay and the

Portuguese settlement at Goa. In the mean time Sir Richard Bickerton arrived at Bombay from England with five men of war, having on board 5000 troops, after a very favourable passage; having neither feen nor heard of the bad weather which had defolated the coasts of India. It was likewise the intention of France to fignalize the campaign of this year by an immense force both by sea and land in India. Exclutive of the forces already on the coast of Coromandel, they were to be joined by 5000 more, all on the 5th of July 1783. At this time the British regulars, from their islands on the African coast. Suffrein was to be reinforced by feveral ships of the line, when it was hoped that a decided fuperiority at fea would be obtained over the English; while their supefhifted in fuch a manner as to enable the French to rior numbers and artillery on shore would render them difengage their ships, a total and ruinous defeat would invincible by any force that could be brought against have enfued. After the engagement, the French ad- them. To oppose these designs it was deemed necesmiral proceeded to Cuddalore, having received intelli- fary by the prefidency of Bombay to make a powergence that a large body of French troops in transports ful diversion on the coast of Malabar. Here was situawas arrived off the island of Ceylon, in company with ted the kingdom of Mysore, the sovereignty of which three ships of the line. As this seemed to afford hopes had been usurped by Hyder Aly under the title of of retaliation, he used such dilgence in resitting his Dayva, as that of the Mahrattas was by a person styled thips, that the fleet was able to put to fea in the be- Pai/bwa. with Arcot. To the northward is the kingdom of fured, but at the same time the just and merited, ven-Canara, which is faid to have been the favourite poffession of Hyder Aly; the name of its capital is Bidnore, which also gives name to an extensive territory, of this dreadful exclamation the following account is and was by Hyder changed to that of Hydernagur. The expedition had been fet on foot as early as the end Expedition of the year 1781; a ftrong body of forces under the of Colonel command of Colonel Humberstone had taken the two cities of Calicut and Panyan, befides others of leffer note, and penetrated into the inland country, which is there difficult and dangerous. Having here made himself master of a place called Mongarry Cotta, of which the fituation commanded the entrance into the inner parts of the country, he proceeded to attack Palatacherry, a confiderable town at fome miles diffance; but being fuddenly environed with a numerous and hoflile army, inflead of making himfelf mafter of the place, it was not without the utmost difficulty that he made his escape after losing all his provisions and baggage. A great army, confifting of 20,000 foot and 10,000 horse, under Tippoo Saib, also advanced against him with fuch celerity, that the colonel had only time to retreat to Panyan, where he was superfeded in the command by Colonel Macloed, and foon after the place was invested by the forces of the enemy, among whom was General Lally with a confiderable body of French. Two British frigates, however, having come to the affiftance of the place, rendered all the attempts of the enemy to reduce it abortive. At last, Tippoo Saib, impatient of delay, made a vigorous effort against the British lines; but though both the Indian and French commanders behaved with great bravery, the attack not only proved unfuccefsful, but they were repulfed with fuch lofs as determined Tippoo to abandon the

fiege of the place, and retire beyond the river of Pan-

charged

tion of Ge- Matthews was dispatched to his assistance with a powerneral Mat- ful reinforcement. This expedition, which began the compaign of 1783 in the kingdom of Canara, has been related with circumstances fo difgraceful, and fo exceedingly contrary to the behaviour for which the British troops are remarkable, that we are totally at a loss to account for them. On the one hand, it feems furprifing how the national character could be forfeited by a particular body, and not by any other part of the army; and on the other, it feems equally furprifing why fuch calumnies (if we suppose them to be so) should have arisen against this particular body and no other part of the army. Such accounts of it, however, were published as raifed the indignation of the military The army gentlemen, who thought proper to publish a vindication of themselves. In the Annual Registers, from with great whence, next to the Gazettes and News-papers, the cruelty in this expedi generality receive what they look upon to be authentic intelligence, the character of this army is treated with the highest asperity. " In the story of the conquest and recovery of Canara (fays the New Annual Regifter), the Spaniards may be faid to be brought a fecond time upon the scene, but not to fit down in fullen and infolent prosperity after all their crimes. The Spaniards of Britain were overtaken in the midft of their career; and he who is more of a man than an the estimates of its amount are very different. By the Englishman, will rejoice in the irregular and unmea- accounts of Bombay it was stated only at 175,000 l.

geance that was inflicted upon them by the prince whose dominions they were ravaging!" In support given of the expedition. It began with the putting in execution a delign formed by General Matthews of carrying the war into the heart of Hyder Aly's dominions. For this purpose the English invested the city of Onore, fituated about 300 miles to the fouth of Bombay, and one of the principal places in the country of Canara. " It was taken by affault (fays Dr Andrews) with great flaughter, and plundered with circumftances of avarice and rapine that difgraced the victors; among whom, at the fame time, great discontents arose concerning the division of the spoil," " No quarter (fays the Annual Register) was given by the victorious English; every man they met was put to the fword. Upon this occasion we beg leave to tranfcribe three lines from the private letter of one of the officers concerned in the expedition. 'The carnage (favs he) was great; we trampled thick on the hodies that were frewed in the way. It was rather shocking to humanity; but such are only secondary confiderations, and to a foldier, whose bosom glows with heroic glory, they are thought only accidents of course; his zeal makes him aspire after farther vic-tory.' This part of the peninsula had hitherto been untouched by the barbarous and unsparing hands of Europeans, and of confequence was full of riches and splendor. In the fortress of Onore were found sums of money to an unknown amount, besides jewels and diamonds. A considerable part of this appears to have been fecured as private plunder by General Matthews. The complaints of the military were loud; they thought, and naturally, that the acquisition of riches was the fair and reasonable consequence of the perpetration of bloodshed. But their commander turned a deaf ear to their representations; and hastened, by adding new laurels to his fame, to hide the flander that might otherwife reft upon him."

From Onore the army proceeded to the nearest fortreffes on the fea-coast, More and Cundapour. Here they were joined by a reinforcement from Bombay under the command of Colonels Macleod and Humberfton, with positive orders to proceed for Bidnore or Hydernagur the capital of Canara. On this General Matthews marched for the mountains called the Ghauts. where there is a pass three miles in length, though only eight feet wide, and which was then strongly fortified and defended by a vast number of the natives. " The English (fay our authors), however, had already obtained a confiderable reputation by their executions; and the use of the bayonet, the most fatal instrument of war, and which was employed by them on all occasions, created such an extreme terror in the enemy, as to enable them to furmount this otherwise impreg-

nable defile."

The gaining of this pass laid open the way to Bidnore the capital, to which a fummons was now fent. An answer was returned, that the place was ready to fubmit, provided the inhabitants were not molefted, and the governor was permitted to fecure his property. The wealth of this city was undoubtedly great, but

India. while the officers concerned in the expedition fay that to capitulate. The terms proposed were, that all pub. India. it was not less than 1,200,000l, or even 1,920,000l.; and even this was only public property; that feized upon by the foldiers, and which belonged to private

persons, was undoubtedly very considerable also-This treasure was at first shown by the general to his officers, and declared to belong to the army; but

he afterwards told them that it was all the property of the Mahommedan governor, and had been fecured to him by the terms of the furrender. It was therefore fent to Cundapour under the convoy of Lieutenant Matthews, brother to the general, to be thence transmitted to Bombay; but whether any part of it ever reached that festlement or not was never known. The discontents of the army were now carried to the utmost height; and the contest became so serious, that Colonels Macleod, Humberstone, and Shaw, quitted the fervice altogether, and returned to Bombay. The officers charged their general with the most insatiable and fhameful avarice; while he, in return, accused his whole army of doing every thing difrespectful and injurious to him; of paying no regard to order and difcipline, and of becoming loofe and unfeeling as the most licentious freebooters.

From Bidnore detachments were fent to reduce feveral fortresses, the principal of which was Ananpour or Anantpore. Here orders were issued for a storm and no quarter. Every man in the place was put to death, except one horfeman who made his escape after being wounded in three places. " The women, unwilling to be separated from their relations, or expofed to the brutal licentiousness of the soldiery, threw themselves in multitudes into the moats with which the fort was furrounded. Four hundred beautiful women, pierced with the bayonet, and expiring in one another's arms, were in this fituation treated by the

British with every kind of outrage."

This exploit was fucceeded by the reduction of Carwa and Mangalore, which completed the reduction of Canara, when General Matthews put his army in

cantonments for the rainy feafon.

This rapid fuccess was owing to the death of Hyder Aly, which happened in the end of the year 1782. His fon Tippoo Saib, however, having taken poffeffion of the government, and fettled his affairs as well as time would allow, inftantly refuned his military operations. On the 7th of April 1783 he made his appearance before Bidnore, fo that General Matthews had scarce time to collect a force of 2000 men, and to write to Bombay for a reinforcement. But, however necessary the latter must have been in his circumstances, the presidency were so much prejudiced against him by the unfavourable reports of his officers, that they suspended him from his commission, appointing Colonel Macleod to fucceed to the command of the army.

Tippoo Saib now advanced with a vaft army, fupposed not to be fewer than 150,000 men, covering the hills on each fide of the metropolis as far as the eye could reach. The army of General Matthews, altogether unable to cope with fuch a force, were quickly driven from the town, and forced to take refuge in the citadel. Tippoo having cut off their retreat by gaining possession of the Ghauts, laid close siege to the fortrefs; which in lefs than a fortnight was obliged

lic property should remain in the fort ; that the English should engage not to act against Tippoo for a stipulated time; that they should march out with the honours of war; that they should pile their arms, and have full liberty to proceed unmolested with their private property to the sea coast, from thence to embark for Bombay; and in this capitulation the garrifons of Annanpour and other inland fortreffes were also in-

All these terms were broken by Tippoo, who faid that they had forfeited their title to liberty by a breach of the articles of capitulation, in embezzling and fecreting the public money, which was all, in good faith, to be delivered up. That this was really the case seems to be univerfally acknowledged. In the Annual Regifter we are told, that " to prevent too much money being found in the possession of one man, the general ordered his officers to draw on the paymafter-general for whatever fums they wanted. When the fort was furrendered to the Sultan, there was not a fingle rupee found in it." By this circumstance the fate of the garrifon was decided. General Matthews was fent for next morning to a conference. He was not, however, admitted to his prefence, but immediately thrown into chains. Most of the other principal officers were, on various pretences, separated from the army. The general and his companions were conducted to Seringapatnam the capital of Myfore; and after having experienced a variety of severities, were at last put to death by poison. In this manner the general and 20 officers perished. The poison administered was the milk of the cocoa-tree, which is faid to be very deadly.

The above account was repeatedly complained of as partial, and at last openly contradicted in a pamphlet intitled " A Vindication of the Conduct of the English Forces" employed in that expedition, and published by order of the East India Company. In this pamphlet the circumstance most found fault with was that regarding the women at Anantpore, which was positively contradicted. On this account therefore the publishers of the above-mentioned work retract that part of their narrative, as being founded in mifreprefentation. Notwithstanding this vindication, however, they still draw the following conclusions. " It is already fufficiently evident, how little has been effected by this vindication of the Bombay officers. The great outlines of the expedition remain unaltered. It is ftill true that a remarkable degree of feverity was employed in the field; that, in the capture of the fortreffes of Canara, the principle of a ftorm and no quarter was very frequently applied; and that the acquifition of money was too much the governing object in every ftage of the undertaking. The vindication of the officers has therefore done them little fervice; and it happens here, as it generally does in the cafe of an imperfect reply, that the majority of the facts are rather ftrengthened and demonstrated by the attempt to refute them. With respect to the conclusion of the story, the treasures of Hydernagur, and the charge brought against them by Tippoo, that they had broken the terms of the capitulation, and that when the fort was furrendered not a rupee was to be found in it; these circumftances are passed over by the officers in the pro-foundest filence. It was this that roused the Sultan to India vengeance; and it is to this that he appeals for his juf- fortrefs in his dominions named Guallior, garrifoned by India. tification in difregarding a capitulation which had been the Mahrattas, and hitherto reckoned impregnable. first dissolved by the vanquished English."

major and 52 fubaltern officers. It feems not, however, to have given entire fatisfaction to the military gentlemen themselves, as other vindications have appeared faid to be written by officers; but these being anonymous, can be supposed to add very little weight to that already mentioned, where fuch a respectable body have figned their names. We shall therefore drop a fubiect fo disagreeable, and the investigation of which at the same time is entirely foreign to the plan of this work.

It now remains to give fome account of the war with the Mahrattas, begun, as was formerly hinted, on account of the protection afforded to the affaffin Roganaut-row. This man had formerly obliged the Account of Mogul to take shelter in the English factory at BeneheMahrat. gal; but being unable to keep up his credit among his countrymen, was expelled as already related. On his arrival at Bombay, an alliance was formed betwixt him and the English government; by which the latter engaged to replace him in the Mahratta regency in confideration of fome valuable cessions of territory. The fupreme council of Bengal, however, difowned this treaty, and concluded one with the Mahrattas in the month of March 1776; by which it was agreed that they should provide for Ragobah's subsistence according to his rank, on condition of his refiding in their country. This being not at all agreeable to Ragobah, he fled once more to Bombay, where a new confederacy was entered into for his restoration. The council of Bengal approved of this on account of the approaching rupture with France; and in confequence of this, a detachment was, in February 1778, ordered to march across the continent of India. By some mismanagements in this expedition the whole army was obliged to capitulate with the Mahratta general on the 9th of January 1779. One of the terms of the capitulation was, that a body of troops which were advancing on the other fide should be obliged to return to Bengal. But General Goddard, the commander of these forces, denying the right of the council of Bengal to remand him, proceeded on his march, and arrived on the 18th of February. Here he received orders to conclude a new treaty, if it could be obtained on easier terms than that of the capitulation by which it had been engaged to cede all our acquisitions in the country of the Mahrattas.

ta War.

Such extreme difregard to any flipulations that could be made, undoubtedly provoked the Mahrattas, and induced them to join in the confederacy with Hy-der Aly already mentioned. The war, however, was fuccefsfully begun by General Goddard in January 1780. In three months he reduced the whole province of Guzerat. Madajee Sindia the Mahratta general advanced to oppose him; but as he did not choose to venture a battle, the English general stormed his camp, and totally routed him. Other exploits were performed in the course of this campaign; during which the governor-general (Mr Haftings) feeing no hopes of an accommodation, entered into a treaty with the rajah of Gohud, and with his confent Major Popham reduced a

These successes were followed by the dreadful incur-The vindication above alluded to was figned by one fions of Hyder Aly already related, which put a ftop to the conquests of General Goddard : all the forces he could spare being required to assist the army under Sir Eyre Coote. The last exploit of General Goddard was the reduction of the island of Salfette, and of a ftrong fortress named Bassein in its neighbourhood. The army of Sindia, confiiting of 30,000 men, was also defeated this year by Colonel Carnac : and the Mahrattas, disheartened by their losses, confented to a separate peace with the English, leaving Hyder Aly to manage the war as he thought proper.

In the mean time, however, the expences incurred by these wars were so high, that Mr Hastings, who was obliged to furnish them some how or other, was reduced to the greatest difficulties. For this purpose not only all the treasure of Bengal was exhausted, but it was found necessary to draw extraordinary contributions from the British allies, which was productive of Revolt of many disagreeable circumstances. One of the most Benares. remarkable was the revolt of Benares. The rajah of this country had formerly put himself under the protection of the English, who on their part agreed to secure his dominions to him on condition of his paying an annual fubfidy to the nabob of Oude. In 1770 the rajah died, and was fucceeded by his fon Cheit Sing, who held the fovereignty at the time we fpeak of. On the death of the nabob in 1775, a new treaty was made with his fucceffor, by which the fovereignty of Benares was transferred to the East India company, an acquisition equivalent to 240,000 l. per annum; at the same time that the subfidy paid by Suja. Dowla, and which, by Lord Clive, had been fixed at 36,000 l. and afterwards raifed to 252,000 l. was now augmented to 312,000l. per annum.

On receiving intelligence in July 1778, that war had actually commenced between France and England, Cheit Sing was required to pay 50,000 l. as his share of the public burdens. Such a demand was paid with extreme reluctance on the part of a prince who already contributed 240,000l. and probably thought that an abundant equivalent for the protection enjoyed. The fame requisition, however, was made the two fucceeding years, but with a promise that the demand should cease when peace was restored. Instead of any present. alleviation, however, a body of troops was also quartered upon him, and he was likewife obliged to pay for their maintenance, left he should not voluntarily pay the additional 50,000 l. In November 1780, in addition to all these demands, he was also required to fend into the field fuch a body of horse as he could spare; but this requisition, owing to some misunderflanding, was never complied with

In July 1781 Mr Haftings having, it is faid, re- Cheit Singceived fome intelligence that the oppressed rajah me-arrested ditated rebellion, fet out on a visit to the nabob of and depar-Oude, and in his way proposed to clear up the mis- fed. understanding with him. The method by which he intended to clear up this mifunderstanding was to lay a fine upon the poor prince of 400,000 l. or 500,000 l.; and as a reason for doing so, it was alleged that the

tate rajah had left a million sterling in his treasury; a

ties with

of Oude.

the nabob

India. fum which was continually increasing. Cheit Sing. advanced to the borders of his territories to meet the governor general, behaved with all imaginable fubmission; and having got private intelligence of what was meditated against him, offered to pay down 200,000l. This was refused; and the governor general having reached the capital, forbid the rajah his presence, and by a letter acquainted him with his causes of complaint. Cheit Sing sent a very submissive answer; but as he endeavoured to exculpate himself. Mr Hastings was so far from being satisfied. that he nut the prince under an arrest.

Such an unheard-of proceeding excited the utmost furprife and refentment in fubjects accustomed to regard their fovereign with a degree of reverence little short of adoration. On the very day of the arrest they affembled tumultuoufly, cut in pieces the guard which had been set on the palace, and carried off their prince in triumph. It does not appear, however, that this was any other than a transitory tumult ; for though they could eafily have cut off the governor-general, they made no attempt against him. Cheit Sing protested his innocence, and made the most unlimited offers of fubmission, but all in vain. His government was declared vacant, and the zemindary beftowed on the next heir; the annual fubfidy to the government of Bengal was augmented from 240,000l. to 400,000l. annually. The miferable rajah was forced to fly his country; and his mother, though promifed leave to retire upon conditions, was attacked in her retreat and plundered by the foldiers. After all his endeavours to procure money, however, Mr Hastings found this adventure turn out much less profitable than he had expected; for the treasury of the fugitive prince was

feized and retained by the foldiery.

New trea-

As to the nabob of Oude, a new treaty was concluded with him; the defign of which was evidently to ease him of some of the burdens to which he was at that time fubjected. Part of the British troops were therefore withdrawn from his dominions. As Fizulla Khan, the most prosperous of his dependents, had been called upon to furnish a body of 5000 horse to join the nabob's army, and had not complied with the requifition, the guarantee of his treaty with the nabob, formerly executed, was withdrawn; but it being afterwards discovered that his territory was not equivalent to the claims of the governor, the treaty was renewed on payment of a flight fine. As the widow of Sujah Dowla was suspected of favouring the late rajah Cheit Sing, the reigning prince was allowed to reclaim the treasures of his father in her possession, and likewise to deprive her of a small province she had in possession, on condition of paying her a certain flipulated allowance annually. The treasures were feized as payment of the debts of the prince to the

company. Hostilities continued in India between the French and English till the year 1783 was far advanced, and long after tranquillity had been reflored to other parts of the world. In the beginning of the feafon for action the governor and council of Bengal determined to fend an ample supply to the presidency of Madras, that fo they might be enabled to put an end to the war, which Tippoo feemed willing to profecute with even more vigour than his father had done. For this

purpose Sir Eyre Coote, who, for his health, had gone India, to Bengal by fea, fet fail once more for Madras, being intrufted with a large fum of money for the necessary expences of the war. In his paffage he was chaced for 48 hours by two French men of war. The folicitude and fatigue he underwent during this time, being almost constantly upon deck, occasioned a relapse, to that he died in two days after his arrival at Madras. His death was greatly lamented, as the greatest expectations had been formed of an happy conclusion being put to the war by his extraordiary military talents, for which he had already acquired fo great reputation in India.

The invation of Tippoo's dominions having called him off from the Carnatic, general Stuart took the opportunity of attacking him in another quarter. Colonel Fullarton was dispatched with a large body of troops to invade the province of Coimbatour. This he executed with great fucces; over-running the country, taking feveral fortreffes, and making a very alarming diversion on this side of Tippoo's dominions. General Stuart, however, having still greater defigns in view, was obliged to recal this gentleman in the midft of his fuccess. The fiege of the strong fortress of Cuddalore was Cuddalore the operation which now engaged his attention. It was unfuccefsnow become the principal place of arms belonging to fully bethe French; was frongly fortified, and garrifoned by fleged by a numerous body of the best troops in France, as well life, as a confiderable number of Tippoo's choicest forces. The fiege therefore proved fo difficult, that though

the English displayed the utmost valour and military skill, they were not able to reduce the place until hostilities were interrupted by the news of a general pacification having taken place in Europe. In this fiege a remarkable circumstance took place, viz. that of a corps of sepoy grenadiers encountering and overcoming the French troops opposed to them with fixed bayonets. For this remarkable instance of valour, they not only received the highest applause at the time, but provision was made for themselves and families by the

prefidencies to which they belonged.

After the reduction of Hydernagur, and the deftruction of the army under general Matthews, the English possessed only three places of consequence in the kingdom of Canara. These were Mangalore, Onore, and Carwa. The fiege of all these places was undertaken at once. Mangalore, the principal port in the country, was defended by a very numerous garrison under Major Campbell. Tippoo fat down before it on the 19th of May; and the attack and defence were both conducted with the greatest spirit and activity. Notwithstanding the utmost efforts of the besiegers, however, and that the garrison were reduced to the last extremity for want of provisions, they held out in spite of every difficulty, until the general pacification being concluded, the place was afterwards delivered up. In other parts nothing more happened than an indecifive engagement between M. Suffrein and admiral Hughes; fo that the British empire in Bengal was for that time fully established, and has fince continued unmolested by foreign enemies, till very lately, that the ambition of Tippoo Saib has again prompted him to invade the territories of the nabob, an ally of Britain. This has again brought on a war with that reftlefs, but able prince; whom the British, however, in conjunction with the

Mahrattas, under the conduct of Lord Cornwallis, are bench. They then withdraw to fit and receive indictionents Indictment. purfuing towards his capital; of the reduction of which, as well as of the entire ruin of Tippoo, the most fanguine hopes are entertained.

INDICTION, in chronology, a cycle of 15 years.

INDICTMENT, in law, one of the modes of pro-

fecuting an offender. See PROSECUTION.

In English law, it is a written accusation of one or more persons of a crime or misdemeanor, preferred to, and prefented upon oath by, a grand jury. To this end, the sheriff of every county is bound to return to every fession of the peace, and every commission of over and terminer, and of general gaol-delivery, twentyfour good and lawful men of the county, some out of every hundred, to inquire, prefent, do, and execute all those things, which on the part of our lord the king shall then and there be commanded them. They ought to be freeholders; but to what amount is uncertain: which feems to be cafus omiffus, and as proper to be supplied by the legislature as the qualifications of the petit jury; which were formerly equally vague and uncertain, but are now fettled by feveral acts of parliament. However, they are usually gentlemen of the best figure in the county. As many as appear upon this pannel, are fworn upon the grand jury, to the amount of twelve at the leaft, and not more than twenty three; that twelve may be a majority. Which number, as well as the conflitution itself, Wilk. L L. we find exactly described so early as the laws of king Ann. Lex. Ethelred : Exeant seniores duodecim thani, et prafectus cum eis, ut jurent super sanctuarium quod eis in manus datur, quod nolint ullum innocentem accufare, nec aliquem noxium celare. In the time of king Richard I. (according to Hoveden), the process of electing the grand jury, ordained by that prince, was as follows: Four knights were to be taken from the county at large, who chuse two more out of every hundred; which two affociated to themselves ten other principal freemen, and those twelve were to answer concerning all particulars relating to their own district. This number was probably found too large and inconvenient; but the traces of this institution still remain, in that some of the jury must

be fummoned out of every hundred. This grand jury

ments, which are preferred to them in the name of the king, but at the fuit of any private profecutor; and they are only to hear evidence on behalf of the profecution : for the finding of an indictment is only in the nature of an inquiry or acculation, which is afterwards to be tried and determined; and the grand jury are only to inquire upon their oaths, whether there be fufficient cause to call upon the party to answer it. A grand jury, however, ought to be thoroughly perfuaded of the truth of an indictment, fo far as their evidence goes; and not to rest satisfied merely with remote probabilities: a doctrine that might be applied to very

oppreffive purpofes.

The grand jury are fworn to inquire only for thebody of the county, pro corpore comitatus; and therefore they cannot regularly inquire of a fact done out of that county for which they are sworn, unless particularly enabled by act of parliament. And to fo high a nicety was this matter anciently carried, that where a man was wounded in one county, and died in another, the offender was at common law indictable in neither, because no complete act of felony was done in any one of them : but by statute 2 and 3 Ed. VI. c. 24. he isnow indictable in the county where the party died. And, by flatute 2 Geo. II. c. 21. if the stroke or poisoning be in England, and the death upon the fea or out of England, or vice verfa, the offenders, and their accessories, may be indicted in the county where either the death, poisoning, or stroke, shall happen. And so in some other cases; as particularly, where treason is committed out of the realm, it may be inquired of in any county within the realm, as the king shall direct, in pursuance of statutes 26 Hen. VIII. c. 13. 33.; Hen. VIII. c. 23. 35.; Hen. VIII. c. 2. 5. 6.; Edw. VI. c. 11. And counterfeiters, washers, or minishers, of the current coin, together with all manner of felous and their accessories, may, by statute 26 Hen. VIII. c. 6. (confirmed and explained by 34 and 35 Hen. VIII. c. 26. § 75. 76.) be indicted and tried for those offences, if committed in any part of Wales, before the juffices of gaol-delivery and of the peace, in the next adjoining county of England, where the king's writ runneth : that is, at prefent in the county of Hereford or Salop; and not, as it should seem, in the county of Chester or Monmouth: the one being a county palatine where the king's writ did not run; and the other a part of Wales, in 26 Tien. VIII. Murders also, whether committed in England or in foreign parts, may, by virtue of the statute 33 Hen. VIII. c. 23. be inquired of and tried by the king's special commission in any shire or place in the kingdom. By flatute 10 and 11 W. III. c. 25. all robberies, and other capital crimes, committed in Newfoundland, may be inquired of and tried in any county in England. Offences against the black act, 9 Geo. I. c. 22. may be inquired of and tried in any county of England, at the option of the profecutor. So felonies, in destroying turnpikes, or works upon navigable rivers, erected by authority of parliament, may, by statutes 8 Geo. II. c. 20. and 13 Geo. III. c. 84. be inquired of and tried in any adjacent county. By flatute 26 Geo. II. c. 19. plunare previously instructed in the articles of their inquiry, dering or stealing from any vessel in distress or wreckby a charge from the judge who prefides upon the ed, or breaking any ship contrary to 12 Ann. st. 25

Black ft

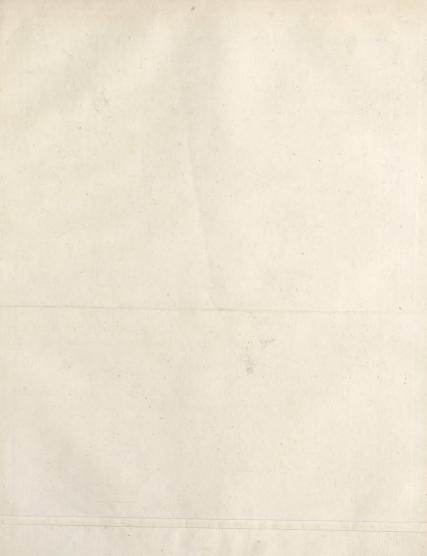

Indictment. c. 18. may be profecuted either in the county where the fact is committed, or in any county next adjoining; and if committed in Wales, then in the next adjoining English county: by which is understood to be meant, fuch English county as, by the flatute 26 Hen. VIII. above mentioned, had before a concurrent jurisdiction of felonies committed in Wales. Felonies committed out of the realm, in burning or deftroving the king's ships, magazines, or stores, may, by flatute 12 Geo. III. c. 24. be inquired of and tried in any county of England, or in the place where the offence is committed. By flatute 13 Geo. III. c. 63. misdemeanors committed in India may be tried upon information or indictment in the court of king's bench in England; and a mode is marked out for examining witnesses by commission, and transmitting their depofitions to the court. But, in general, all offences must be inquired into, as well as tried, in the county where the fact is committed. Yet if larciny be committed in one county, and the goods carried into another, the offender may be indicted in either; for the offence is complete in both. Or he may be indicted in England for larginy in Scotland, and carrying the goods with him into England, or vice versa; or for receiving in one part of the united kingdom goods that have been Rolen in another. But for robbery, burglary, and the like, he can only be indicted where the fact was actually committed: for though the carrying away and keeping of the goods is a continuation of the original taking, and is therefore larciny in the fecond county, yet it is not a robbery or burglary in that jurisdiction. And if a person be indicted in one county for larginy of goods originally taken in another, and be thereof convicted, or flands mute, he shall not be admitted to his clergy; provided the original taking be attended with fuch circumstances as would have ousted him of his clergy by virtue of any flatute made previous to the year

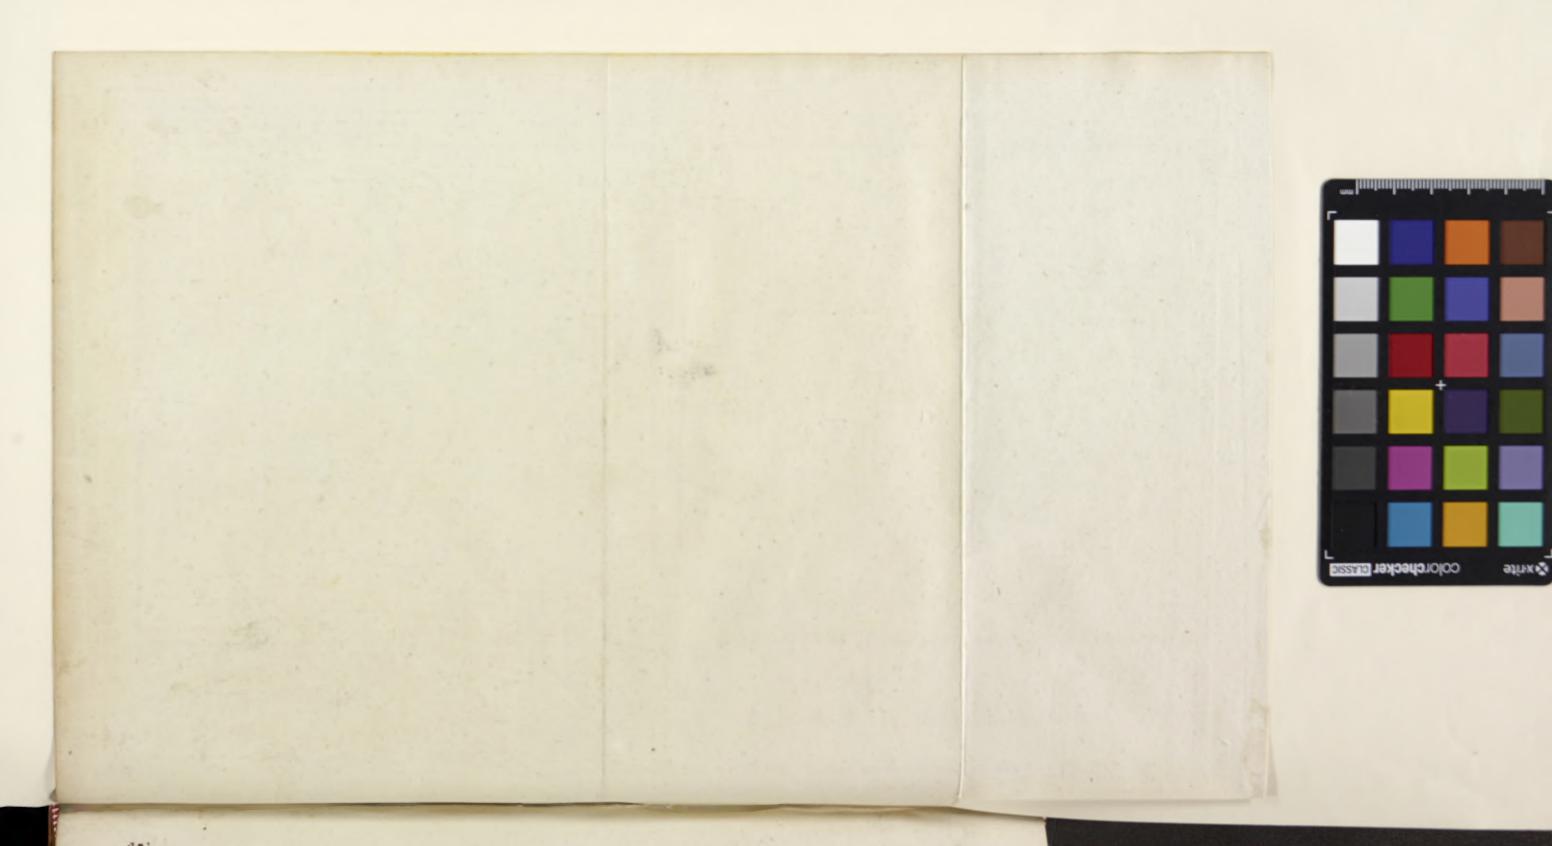

When the grand jury have heard the evidence, if they think it a groundless accusation, they used formerly to endorse on the back of the bill, Ignoramus; or, We know nothing of it: intimating, that though the facts might possibly be true, that truth did not appear to them. But now they affert in English more abfolutely, Not a true bill; or (which is the better way) Not found: and then the party is discharged without farther answer. But a fresh bill may afterwards be preferred to a fubfequent grand jury. If they are fatisfied of the truth of the accusation, they then endorse upon it, " A true bill;" anciently, Billa vera. The indictment is then faid to be found, and the party stands indicted. But to find a bill, there must at least twelve of the jury agree: for fo tender is the law of England of the lives of the subjects, that no man can be convicted at the fuit of the king of any capital offence, unless by the unanimous voice of twentyfour of his equals and neighbours; that is, by twelve at least of the grand jury, in the first place, assenting to the accusation; and afterwards by the whole petit jury of twelve more, finding him guilty upon his trial. But if twelve of the grand jury affent, it is a good presentment, though some of the rest disagree. And the indictment, when so found, is publicly delivered into court.

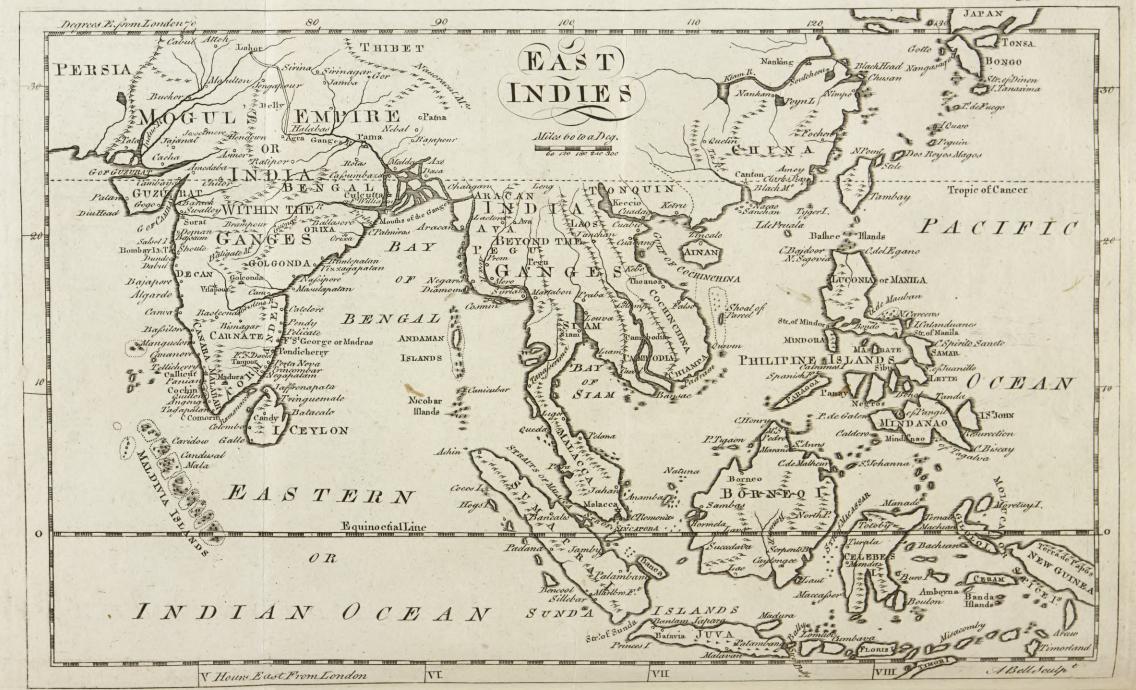

Indictments must have a precise and sufficient cer-Nº 166.

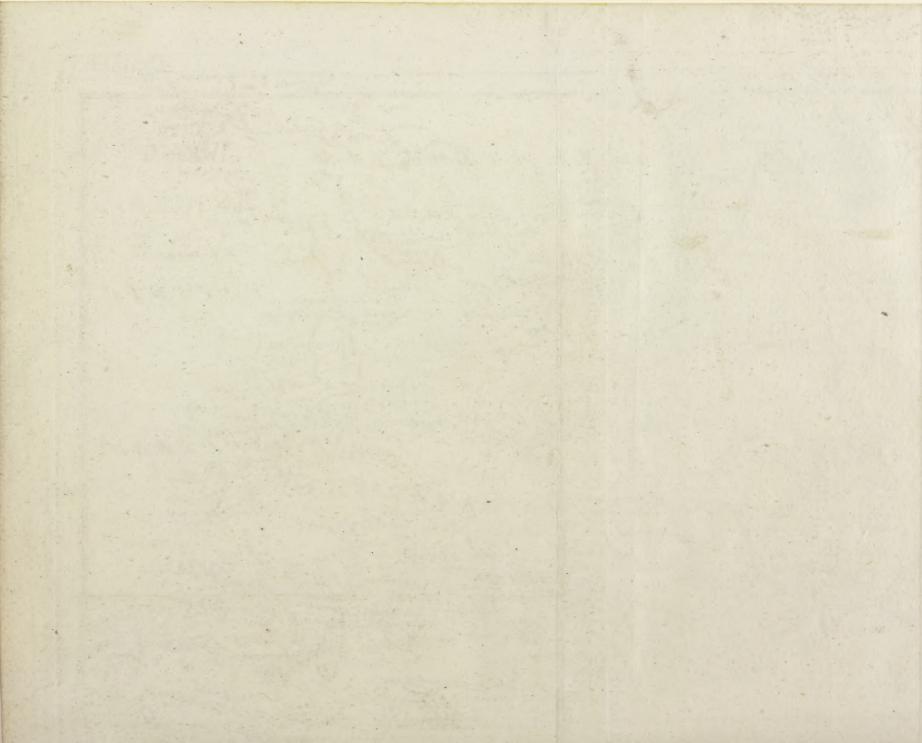

tainty. By flatute t Hen. V. c. 5. all indichments Indichment. must fet forth the Christian name, surname, and addition of the state and degree, mystery, town, or place, and the county of the offender; and all this to identify his person. The time and place are also to be ascertained, by naming the day and township in which the fact was committed : though a mistake in these p is in general not held to be material, provided the time be laid previous to the finding of the indictment. and the place to be within the jurisdiction of the court; unless where the place is laid, not merely as a venue. but as part of the description of the fact. But fometimes the time may be very material, where there is any limitation in point of time assigned for the profecution of offenders; as by the statute 7 Will. III. c. 3. which enacts, that no profecution shall be had for any of the treasons or misprisions therein mentioned (except an affaffination defigned or attempted on the person of the king), unless the bill of indictment be found within three years after the offence committed: and, in case of murder, the time of the death must be laid within a year and a day after the mortal ftroke was given. The offence itself must also be set. forth with clearness and certainty; and in some crimes particular words of art must be used, which are so appropriated by the law to express the precise idea which it entertains of the offence, that no other words, however fynonymous they may feem, are capable of doing it. Thus, in treason, the facts must be laid to be done " treasonably, and against his allegiance;" anciently, proditorie et contra ligeantia fua debitum;" else the in-dictment is void. In indictments for murder, it is necessary to fay that the party indicted " murdered," not "killed" or "flew," the other; which, till the late flatute, was expressed in Latin by the word murdravit. In all indictments for felonies, the adverb " felonioully," felonice, must be used; and for burglaries also, burglariter, or, in English, "burglariously;" and all these to ascertain the intent. In rapes, the word rapuit, or "ravished," is necessary, and must not be expressed by any periphrasis, in order to render the crime certain. So in larcinies also, the words felonice cepit et asportavit, " feloniously took or carried away," are necessary to every indictment; for these only can express the very offence. Also, in indictments for murder, the length and depth of the wound should in general be expressed, in order that it may appear to the court to have been of a mortal nature : but if it goes through the body, then its dimensions are immaterial; for that is apparently sufficient to have been the cause of the death. Also, where a limb, or the like, is abfolutely cut off, there fuch description is needless. Lattly, in indictments, the value of the thing which is the fubject or instrument of the offence must fometimes be expressed. In indictments for larcinies this is necessary, that it may appear whether it be grand or petit larciny; and whether intitled or not to the benefit of clergy. In homicides of all forts it is necessary; as the weapon with which it is committed is forfeited to the king as a deodand. For the manner of process upon an indictment, see PROCESS. INDICTMENT, in Scots law, the name of the fum-

mons, or libel, upon which criminals are cited before the court of justiciary to stand trial. See LAW, Part III. nº clxxxvi, 44.

Plea to INDICTMENT. See PLEA. INDIES, East and West. See INDIA and AMEdigofera. RICA, and Plates CCLIV. CCLV.

INDIGENOUS, of indigena, denotes a native of a country, or that which was originally born or produced in the country where it is found. In this fenfe, particular fpecies of animals and plants are faid to be indigenous in the country where they are native, in opposition to Exoric

INDIGESTION, a crudity or want of due coction of the food in the ftomach. See DIGESTION.

INDIGETES, a name which the ancients gave to fome of their gods.

There are various opinions about the origin and fignification of this word. Some pretend it was given to all the gods in general; and others, only to the demigods, or great men deified. Others fav, it was given to fuch gods as were originally of the country, or rather fuch as were the gods of the country that bore this name; and others again hold it was afcribed to fuch gods as were patrons and protectors of particular cities. Laftly, others hold indigetes to be derived from inde genitus or in loco degens, or from inde and ago, for dega, " I live, I inhabit;" which last opinion feems the moit probable.

In effect it appears, 1. That thefe indigetes were also called local gods (dii locales), or topical gods, which is the fame thing. 2. The indigetes were ordinarily men deified, who indeed were in effect local gods, being efteemed the protectors of those places where they were deified; fo that the fecond and third opinions are very confistent. 3. Virgil joins patrii with indigetes, as being the fame thing, Georg. i. ver. 498. "Dii patrii, indigetes." 4. The gods to whom the Romans gave the name indigetes were, Faunus, Vesta, Æneas, Romulus, all the gods of Italy; and at Athens, Minerva, fays Servius; and at Carthage, Dido. It is true, we meet with Jupiter indiges : but that Jupiter indiges is Æneas, not the great Jupiter; as we may fee in Livy, lib. i. cap. 3. in which last sense Servius assures us, indiges comes from the Latin in diis ago, "I am among the gods."

Among these indigetes gods, there is none more celebrated, nor more extensively worshipped, than

INDIGO, a dye prepared from the leaves and fmall branches of the Indigofera Tinctoria. See the

INDIGOFERA, the INDIGO PLANT : A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, Papilionacea. The calyx is patent; the carina of the corolla furnished with a subulated patulous fpur on each fide; the legumen is linear .-There are five species; the most remarkable of which is the tindoria, a native of the warm parts of Asia, Africa, and America, and from which the Indigo dye is made. The root of this plant is three or four lines thick, and more than a foot long, of a faint fmell fomething like parfley. From this root iffues a fingle ftem nearly of the fame thickness, about two feet high, flraight, hard, almost woody, covered with a back flightly split, of a grey ash colour towards the bottom, green in the middle, reddish at the extremity, and without appearance of pith in the infide. The leaves, ranged in pairs around the stalk, are of

Vol. IX. Part. I.

above, of a deep green on the under-fide, and connected by a very fhort peduncle. From about one third of the stem to the extremity there are ears that are loaded with very small flowers from a dozen to 15, but deflitute of fmell. The piftil, which is in the midft of each flower, changes into a pod, in which the feeds are

This plant requires a fmooth rich foil, well tilled, and not too dry. The feed of it, which, as to figure and colour, refembles gun-powder, is fown in little furrows that are about the breadth of the hoe, two or three inches deep, at a foot's diftance from each other, and in as thraight a line as possible. Continual attention is required to pluck up the weeds, which would foon choak the plant. Though it may be fown in all feafons, the spring is commonly preferred. Moisture causes this plant to shoot above the surface in three or four days. It is ripe at the end of two months. When it begins to flower, it is cut with pruning knives; and cut again at the end of every fix weeks, if the weather is a little rainy. It lasts about two years, after which term it degenerates; it is then plucked up, and planted afresh. As this plant soon exhaufts the foil, because it does not absorb a fufficient quantity of air and dew to moisten the earth, it is of advantage to the planter to have a vaft space which may remain covered with trees, till it becomes neceffary to fell them in order to make room for the indigo.

Indigo is diffinguished into two kinds, the true and the bastard. Though the first is fold at a higher price on account of its fuperiority, it is usually advantageous to cultivate the other, because it is heavier. The first will grow in many different foils; the second fucceeds best in those which are most exposed to the rain. Both are liable to great accidents. Sometimes the plant becomes dry, and is destroyed by an infect frequently found on it; at other times, the leaves, which are the valuable part of the plant, are devoured in the space of 24 hours by caterpillars. This last misfortune, which is but too common, has given occasion to the faying, "that the planters of indigo go to bed rich, and rife in the morning totally

This production ought to be gathered in with great precaution, for fear of making the farina that lies on the leaves, and is very valuable, fall off by shaking it. When gathered, it is thrown into the fleeping-vat, which is a large tub filled with water. Here it undergoes a fermentation, which in 24 hours at furthest is completed. A cock is then turned, to let the water run into the fecond tub, called the mortar or pounding tub. The steeping-vat is then cleaned out, that fresh plants may be thrown in; and thus the work is continued without interruption.

The water which has run into the pounding-tub is found impregnated with a very fubtile earth, which alone conflitutes the dregs or blue fubstance that is the object of this process, and which must be separated from the useless falt of the plant, because this makes the dregs fwim on the furface. To effect this, the water is forcibly agitated with wooden buckets, that are full of holes and fixed to a long handle. This part of the process requires the greatest precautions.

Indigofera. If the agitation be difcontinued too foon, the part terated, the extraneous matter will be perceived in firata Individual of a different colour.

INDIVIDUAL, a particular being of any species. or that which cannot be divided into two or more beings equal or alike.

The usual division in logic is made into genera, or into genuses; those genera into species; and those spe-

cies into individuals.

INDIVISIBLE, among metaphyficians - A thing is faid to be abfolutely indivisible, that is a simple being, and confifts of no parts into which it may be divided. Thus, God is indivifible in all respects; as is also the human mind; not having extension, or other properties of body.

INDIVISIBLES, in geometry, the elements or principles into which any body or figure may be ultimately refolved; which elements are supposed to be infinitely fmall: thus, a line may be faid to confit of points, a furface of parallel lines, and a folid of parallel and fimilar furfaces.

INDORSEMENT, in law, any thing written on the back of a deed; as a receipt for money received.

There is likewise an indorsement, by way of assignment, on bills of exchange and notes of hand; which is done by writing a person's name on the back thereof.

INDOSTAN, or HINDOSTAN, PROPER INDIA, OF the Empire of the Great Mogul. See HINDOSTAN.

INDUCTION, in logic and rhetoric, a confequence drawn from feveral propositions or principles first laid down. See Logic; and ORATORY, no 32.

INDUCTION, in law, is putting a clerk or clergy. man in possession of a benefice or living to which he is collated or presented. See the article PARSON .-Induction is performed by a mandate from the bishop to the arch-deacon, who usually iffues out a precept to other clergymen to perform it for him. It is done by giving the clerk corporal possession of the church, as by holding the ring of the door, tolling a bell, or the like; and is a form required by law, with intent to give all the parishioners due notice and sufficient certainty of their new minister, to whom their tythes are to be paid. This therefore is the investiture of the temporal part of the benefice, as inititution is of the spiritual. And when a clerk is thus presented, instituted, and inducted into a rectory, he is then, and not before, in full and complete poffeffion; and is called in law persona impersonata, or parson imparsonce.

INDULGENCES, in the Romish church, are a remission of the punishment due to sins, granted by the church, and supposed to fave the sinner from Purgatory.

According to the doctrine of the Romish church, all the good works of the faints over and above those which were necessary towards their own justification, are deposited, together with the infinite merits of Jesus Christ, in one inexhaustible treasury. The keys of this were committed to St Peter, and to his fucceffors the popes, who may open it at pleasure, and by transferring a portion of this superabundant merit to any particular perfon, for a fum of money, may convey pure colouring fubiliance when flanding in a liquid to him either the pardon of his own fins, or a release for any one in whom he is interested, from the pains porated; whence, on breaking a bit of indigo fo adul- of Purgatory. Such includences were first invented

that is used in dying not being sufficiently separated from the falt, would be loft. If, on the other hand, the dve were to be agitated too long after the complete separation, the parts would be brought together again, and form a new combination; and the falt reacting on the dregs would excite a fecond fermentation, that would alter the dye, spoil its colour, and make what is called burnt indigo. These accidents are prevented by a close attention to the least alterations that the dye undergoes, and by the precaution which the workmen take to draw out a little of it from time to time in a clean veffel. When they perceive that the coloured particles collect by feparating from the rest of the liquor, they leave off shaking the buckets, in order to allow time to the olue dregs to precipitate to the bottom of the tub, where they are left to fettle till the water is quite clear .-Holes made in the tub, at different heights, are then opened one after another, and this useless water is let out. The blue dregs remaining at the bottom having

acquired the confiftence of a thick muddy liquid, cocks are then opened, which draw it off into the fettler. After it is fill more cleared of much superfluous water in this third and last tub, it is drained into facks; from whence, when water no longer filters through the cloth, this matter, now become of a thicker confiftence, is put into chefts, where it entirely lofes its moisture. At the end of three months the indigo

is fit for fale.

It is used, in washing, to give a bluish colour to linen: painters also employ it in their water colours; and dyers cannot make fine blue without indigo. The ancients procured it from the East-Indies; in modern times, it has been transplanted into America. The cultivation of it, successively attempted at different places, appears to be fixed at Carolina, St Domingo, and Mexico. That which is known under the name of Guatimala indigo, from whence it comes, is

the most perfect of all.

There are two kinds of indigo prepared in the East-Indies, particularly on the coast of Coromandel, at Pondichery, &c. Of these the worst kind is used for giving the body of colour to the dyed fubstance, the other being employed only to give it a gloss afterwards. The finest is prepared on the coast of Agra, Mafulipatam, and Ayanoo, but especially in the island of Java; but this last, being extremely dear, is very little used by the dyers. The best ought to float on the furface of water; its colour ought to be a very dark blue inclining to violet, bright and fparkling, especially when broken. It may be tried by diffolving a little in a glass of water : if pure, it will mix equably with the liquor; but if otherwife, will separate and fall to the bottom. Another method of trying the goodness of this substance is by fire; for the pure indigo will be entirely confumed, while the extraneous particles will remain. The pounded indigo is much more subject to adulteration than fuch as is fold in cakes or tablets; as the ashes or dirt with which it is mixed are very apt to separate from the state, as it must always do before the moisture is evaIndulgen- in the 11th century, by Urban II. as a recompence for those who went in person upon the glorious enter-prize of conquering the Holy Land. They were afterwards granted to those who hired a foldier for that purpose; and in process of time were bestowed on fuch as gave money for accomplishing any pious work enjoined by the Pope.

The power of granting indulgences has been greatly abused in the church of Rome. Pope Leo X. in order to carry on the magnificent structure of St Peter's at Rome, published indulgences, and a plenary remission, to all fuch as should contribute money towards it. Finding the project take, he granted to Albert elector of Mentz, and archbishop of Magdeburg, the benefit of the indulgences of Saxony and the neighbouring parts, and farmed out those of other countries to the highest bidders ; who, to make the best of their bargain, procured the ablest preachers to cry up the value of the ware. The form of these indulgences was as follows: " May our Lord Jefus Christ have mercy upon thee, and absolve thee by the merits of his most holy passion. And I, by his authority, that of his bleffed apostles Peter and Paul, and of the most holy Pope, granted and committed to me in these parts, do absolve thee, first from all ecclesiastical cenfures, in whatever manner they have been incurred; then from all thy fins, transgressions, and excesses, how enormous foever they may be, even from fuch as are referved for the cognizance of the holy fee, and as far as the keys of the holy church extend: I remit to you all punishment which you deserve in Purgatory on their account; and I restore you to the holy facraments of the church, to the unity of the faithful, and to that innocence and purity which you poffeffed at baptism; so that when you die, the gates of punishment shall be shut, and the gates of the paradise of delight shall be opened: and if you shall not die at present, this grace shall remain in full force when you are at the point of death. In the name of the Father, and of the Son, and of the Holy Ghoft."

The terms in which the retailers of indulgences described their benefits and the necessity of purchasing them, are fo extravagant, that they appear almost incredible. If any man (faid they) purchases letters of indulgence, his foul may rest secure with respect to its falvation. The fouls confined in Purgatory, for whose redemption indulgences are purchased, as soon as the money tinkles in the cheft, instantly escape from that place of torment, and afcend into heaven. That the efficacy of indulgences was fo great, that the most heinous fins, even if one should violate (which was impossible) the mother of God, would be remitted and expiated by them, and the person be freed both from punishment and guilt. That this was the unfpeakable gift of God, in order to reconcile men to himself. That the cross erected by the preachers of indulgences was equally efficacious with the crofs of Christ itself. " Lo! the heavens are open; if you enter not now, when will you enter? For twelve pence you may redeem the foul of your father out of Purgatory; and are you fo ungrateful, that you will not rescue your parent from torment? If you had but one coat, you ought to ftrip yourfelf inflantly, and fell it, in order to purchase such benefits," &c.

It was this great abuse of indulgences that contri-

buted not a little to the first reformation of religion Indult in Germany, where Martin Luther began first to de-claim against the preachers of indulgences, and after. wards against indulgences themselves; but fince that time the popes have been more sparing in the exercise of this power: however, they itill carry on a great trade with them to the Indies, where they are purchased at two rials a piece, and sometimes more.

The pope likewife grants indulgences to perfons at the point of death; that is, he grants them, by a brief, power to choose what confessor they please, who is authorized thereby to absolve them from all their fins

in general.

INDULT, in the church of Rome, the power of prefenting to benefices granted to certain perfons by the pope. Of this kind is the indult of kings and fovereign princes in the Romish communion, and that of the parliament of Paris granted by feveral popes. By the concordat for the abolition of the pragmatic fanction, made between Francis I. and Leo X. in 1516, the French king has the power of nominating to bishoprics, and other confistorial benefices, within his realm. At the fame time, by a particular bull, the pope granted him the privilege of nominating to the churches of Brittany and Provence. In 1648 pope Alexander VIII. and in 1668 Clement 1X. granted the king an indult for the bishoprics of Metz, Toul, and Verdun, which had been yielded to him by the treaty of Munster; and in 1668 the fame pope Clement IX. granted him an indult for the benefices in the counties of Roufillon, Artois, and the Netherlands. The cardinals likewife have an indult granted them by agreement between pope Paul IV. and the facred college in 1555, which is always confirmed by the popes at the time of their election. By this treaty the cardinals have the free difpofal of all the benefices depending on them, and are empowered likewise to bestow a benefice in commen-

INDULTO, a duty, tax, or custom, paid to the king of Spain for all fuch commodities as are imported from the West Indies in the galleons.

INDUS, a large river of Asia, which rifes in the mountains which separate Tartary from India, and discharges itself into the Indian ocean. See HINDOS-TAN and INDIA.

INEBRIANTS, are defined to be fuch things as affect the nerves in a particular and agreeable manner, and through them alter and diffurb the functions of the mind. They are properly divided into native and artificial; the former chiefly in use among the oriental and other nations, the latter principally throughout

Natural Inebriants, are, 1. Opium; in use all over the eaft, and of which the Turks, through custom, swallow a drachm. 2. Peganum harmala, Syrian rue. The feeds are fold in Turkey for this purpose; and with these, as Bellonius relates, the Turkish emperor Solyman kept himfelf intoxicated. 3. Maflac of the Turks, or bangue of the Persians ; prepared from the dust of the maleflower of hemp, or from the leaves. 4. Bangue of the Indians, from the leaves of the hibifeus fabdariffa. 5. Seeds of various species of the datura, or thorny apple. 6. Pinang, or betel of the Indians. 7. Roots of black henbane. 8. The hyofcyamus phyfaloides. 9. Berries of the deadly nightshade. 10. Leaves of E e 2 millfoil.

millfoil, are used by the Dalekarlians to render their beer intoxicating, 11. Tobacco, and feveral others lefa material are mentioned; fuch as clary, faffron, and darnel.

Artificial Inebriants, are fermented liquors from farinaccous feeds; wines, and spirits drawn by distillation. With these is ranked the nectar of the gods, and the anodyne medicine of Homer, commonly called nepenthes; and the spells by which Medea and Circe pro-

INERTIA of MATTER, in philosophy, is defined by Sir Ifaac Newton to be a paffive principle by which bodies perfit in their motion or reft, receive motion in proportion to the force impreffing it, and relift as much as they are refifted. It is also defined by the fame author to be a power implanted in all matter, . whereby it refitts any change endeavoured to be made in its flate. See MECHANICS.

INESSE is applied to things which are actually

existing.

Authors make a difference between a thing in effe, and a thing in posse: a thing that is not, but may be, they fay is in pole, or potentia; but a thing apparent and visible, they fay is in effe, that is, has a real being eo inflanti; whereas the other is cafual, and at best

but a poffibility.

INFALISTACIO, an ancient punishment of felons, by throwing them among the rocks and fands, cuftomarily used in port-towns. It is the opinion of fome writers, that infaliflatus did imply fome capital punishment, by exposing the malefactor upon the fands till the next tide carried him away; of which cuftom, it is faid, there is an old tradition. However the penalty feems to take its name from the Norman falefe, or falefia, which fignified not the fands, but the rocks and cliffs adjoining, or impending on the fea-shore. Commisit feloniam ob quam fuit suspensus, utlegatus, vel alio modo morti damnatus, &c. vel apud Dover infaliftatus, and Southampton Submerfus, &c.

INFALLIBLE, fomething that cannot err, or be

One of the great controversies between the Proteflants and Papifte, is the infallibility which the latter attribute to the pope; though, in fact, they themfelves are not agreed on that head, fome placing this pretended infallibility in the pope and a general coun-

INFAMY, in law, is a term which extends to forgery, perjury, gross cheats, &c. by which a person is rendered incapable of being a witness or juror, even

though he is pardoned for his crimes.

INFANCY, the first part of life.—Fred. Hoffman fays, that the human species are infants until they begin to talk, and children to the age of puberty .- Anatomy discovers to us, that during infancy there is much imperfection on the human frame; e. g. its parts are disproportioned, and its organs incapable of those functions which in future life they are defigned to per-The head is larger in proportion to the bulk of the body than that of an adult. The liver and pancreas are much larger in proportion than in advanced life; their fecretions are more in quantity also. The bile is very inert; the heart is stronger and larger than in future life; the quantity of blood fent through the heart of an infant, in a given time, is also more in proportion than in adults. Though these circum-

flances have their important usefulness, yet the imper- Infant. fection attending them subjects this age to many injuries and dangers from which a more perfect ftate is exempted. Dr Percival observes, in his Esfays Med. and Exp. that of all the children who are born alive, two thirds do not live to be two years old.

Infants have a larger proportion of brain than adults, hence are most subject to nervous disorders; and hence the diagnostics of difeases are in many respects obscure or uncertain, as particularly those taken from the pulse, which, from the irritability of the tender bodies of infants, is fuddenly affected by a variety of accidents too numerous, and feemingly too trivial to gain our attention. However, no very great embarraffment arifes to the practitioner from hence; for the diforders in this flate are generally acute, lefs complicated than those in adults, and are more casily discovered than is

generally apprehended.

INFANT, denotes a young child. See INFANCY. INFANTS, amongst the Jews, Greeks, and Romans, were fwadled as foon as they were born, in a manner fimilar to that practifed by the moderns. The Jews circumcifed and named their infant children on the 8th day from the birth. Upon the birth of a fon, the Grecians crowned their doors with olive-of a daughter, with wool. The infant was washed in warm water, and anointed with oil-by the Spartans with wine; it was then dreffed, and laid in a balket, or on a shield if the father was a warrior, particularly among ft the Spartans. At five days old they ran with it round the fire. and the mother's relations fent prefents. The Greeks named their children on the tenth day, the Romans. on the ninth: The naming was attended with facrifices and other demonstrations of joy. The maternal office of fuckling their own children was never declined, when circumftances would permit. How much different is this from the unnatural delicacy observed by modern mothers, a delicacy which to the child is cruelty! The 40th day was a day of folemaity for the mother. The names of children were registered both. by the Greeks and Romans. See REGISTER.

For an account of the cultom of expoling infants,

fee Exposing.

Infants were kept from crying in the ftreets by means of a sponge soaked in honey. Nurses had also their bugbears and terrible names to frighten the children into peace :- The figure with which they were principally intimidated was Mopuoyuxton, a fort of rawhead and bloody bones.

INFANT, in law, is a perfon under 21 years of age; whose capacities, incapacities, and privileges, are va-

rious.

1. In criminal matters. The law of England does in some cases privilege an infant under the age of 21, as to common mildemeanours; fo as to escape fine, imprisonment, and the like: and particularly in the cases of omission, as not repairing a bridge, or a high way, and other fimilar offences; for, not having the command of his fortune till the age of 21, he wants the capacity to do those things which the law requires. But where there is any notorious breach of the peace, Blacks. a riot, battery, or the like, (which infants when full- Gomment grown are at leaft as liable as others to commit); for those, an infant above the age of 14 is equally liable to fuffer, as a person of the full age of 21.

With regard to capital crimes, the law is still more to have sufficient discretion, may bequeath her personal Insant. minute and circumfrect; diffinguishing with greater nicety the feveral degrees of age and discretion. By the ancient Saxon law, the age of twelve years was established for the age of possible discretion, when first the understanding might open: and from thence till the offender was 14, it was atas pubertati proxima, in which he might, or might not, be guilty of a crime, according to his natural capacity or incapacity. This was the dubious stage of discretion : but, under twelve, it was held, that he could not be guilty in will, neither after fourteen could be supposed innocent, of any capital crime which he in fact committed. But by the law, as it now stands, and has stood at least ever fince the time of Edward III. the capacity of doing ill, or contracting guilt, is not fo much measured by years and days, as by the ftrength of the delinquent's underflanding and judgment. For one lad of 11 years old may have as much cunning as another of 14; and in these cases our maxim is, that malitia supplet etatem. Under feven years of age, indeed, an infant cannot be guilty of felony; for then a felonious difcretion is almost an impossibility in nature : but at eight years old, he may be guilty of felony. Alfo, under 14, though an infant shall be prima facie adjudged to be dolia in capax, yet if it appear to the court and jury that he was doli capax, and could differn between good and evil. he may be convicted and fuffer death. Thus a girl of 13 has been burnt for killing her miftrefs: and one boy of ten, and another of nine years old, who had killed their companions, have been fentenced to death, and he of ten years actually hanged; because it appeared upon their trials, that the one hid himfelf, and the other hid the body he had killed; which hiding manifested a consciousness of guilt, and a discretion to difcern between good and evil. And there was an instance in the last century, where a boy of cight years old was tried at Abington for firing two barns; and, it appearing that he had malice, revenge, and cunning, he was found guilty, condemned, and hanged accordingly. Thus also, in very modern times, a boy of ten years old was convicted on his own confession of murdering his bedfellow; there appearing in his whole behaviour plain tokens of a mifchievous difposition: and, as the sparing this boy merely on account of his tender years might be of dangerous confequence to the public, by propagating a notion that children might commit fuch atrocious crimes with impunity, it was unanimously agreed by all the judges, that he was a proper subject of capital punishment. But, in all fuch cases, the evidence of that malice, which is to fupply age, ought to be ftrong and clear beyond all

doubt and contradiction. 2. In civil matters. The ages of male and female are different for different purpofes. A male at 12 years old may take the oath of allegiance; at 14 is at the years of difcretion, and therefore may confent or difagree to marriage, may choose his guardian, and, if his discretion be actually proved, may make his testament of his personal estate; at 17 may be an executor; and at 21 is at his own disposal, and may aliene his lands, goods, and chattels. A female also at seven years of age may be betrothed or given in marriage; at nine is intitled to dower; at 12 is at years of maturity, and therefore may confent or difagree to marriage, and, if proved estate; at 14 is at years of legal diferetion, and may choose a guardian; at 17 may be executrix; and at 21 may dispose of herfelf and her lands. So that full age in male or female is 21 years, which are is completed on the day preceding the anniversary of a person's birth; who till that time is an infant, and fo flyled in law. Among the ancient Greeks and Romans, women were never of age, but subject to perpetual guardianthip, unless when married, nift convenissint in manunt viri: and, when that perpetual tutelage wore away in process of time, we find that, in females as well as males, full age was not till 25 years. Thus by the is merely arbitrary, and juris politivi, is fixed at different times. Scotland agrees with England in this point; (both probably copying from the old Saxon constitutions on the continent, which extended the age of minority ad annum vigefimum prinum, et eo ufque juvenes fub tutelam reponunt): but in Naples persons are of full age at 18; in France, with regard to marriage, not till 30; and in Holland at 25.

The very difabilities of infants are privileges; inorder to fecure them from hurting themselves by their own improvident acts. An infant cannot be fued but under the protection, and joining the name, of his guardian; for he is to defend him against all attacks as well by law as otherwife; but he may fue either by his guardian, or prochein amy, his next friend who is not his guardian. This prochein amy may be any perfon who will undertake the infant's cause; and it frequently happens, that an infant, by his prochein amy, inflitures a fuit in equity against a fraudulent guar-

With regard to effates and civil property, an infant hath many privileges. In general, an infant shall lofe nothing by nonclaim, or neglect of demanding his right; nor shall any other laches or negligence be imputed to an infant, except in some very particular cases.

It is generally true, that an infant can neither aliene his lands, nor do any legal act, nor make a deed, nor indeed any manner of contract, that will bind him. But still to all these rules there are some exceptions :. part of which were just now mentioned in reckoning up the different capacities which they assume at different ages: and there are others, a few of which it may not be improper to recite, as a general specimen of the whole. And, first, it is true, that infants cannot aliene their effates; but infant truffees, or mortgagees, are enabled to convey, under the direction of the court of chancery or exchequer, or other courts of equity, the estates they hold in trust or mortgage, to such person as the court shall appoint. Also it is generally true, that an infant can do no legal act: yet an infant, who has an advowfon, may prefent to the benefice when it becomes void. For the law in this case dispenses with one rule, in order to maintain others of far greater confequence: it permits an infant to prefent a clerk (who, if unfit, may be rejected by the bishop), rather than either fuffer the church to be unferved till he comes of age, or permit the infant to be debarred of his right by lapfe to the bishop. An infant may also purchase lands, but his purchase is incomplete; for, when he comes to age, he may either agree or difagree to it, as he thinks prudent or proper, without allegingI fante any reason; and so may his heirs after him, if he dies without having completed his agreement. It is, farther, generally true, that an infant, under 21, can make no deed but what is afterwards voidable: yet in fome cases he may bind himself apprentice by deed indented or indentures, for feven years; and he may by deed or will appoint a guardian to his children, if he has any, Laftly, it is generally true, that an infant can make no other contract that will bind him; yet he may bind himself to pay for his necessary meat, drink, apparel, physic, and such other necessaries; and likewise for his good teaching and instruction, whereby he may profit himself afterwards.

INFANTE, and INFANTA, all the fons and daughters of the kings of Spain and Portugal, except the eldeft; the princes being called infantes, and the prin-

INFANTRY, in military affairs, the whole body of foot-foldiers, whether independent companies or regiments .- The word takes its origin from one of the infantas of Spain, who, finding that the army commanded by the king her father had been defeated by the Moors, affembled a body of foot-foldiers, and with them engaged and totally routed the enemy. In memory of this event, and to difting rifh the foot-foldiers, who were not before held in much confideration, they received the name of infantry.

Heavy-armed INFANTET, among the ancients, were fuch as wore a complete fuit of armour, and engaged with broad shields and long spears. They were the flower and ftrength of the Grecian armies, and had

the highest rank of military honour. Light-Armed INFANTRY, among the ancients, were defigned for skirmishes, and for fighting at a distance,

Their weapons were arrows, darts, or flings,

Light INFANTEY, among the moderns, have only been in use fince the year 1656. They have no campequipage to carry, and their arms and accourrements are much lighter than those of the infantry. Light infantry are the eyes of a general, and the givers of fleep and fafety to an army. Wherever there is found light cavalry, there should be light infantry. They should be accustomed to the pace of four miles an hour, as their usual marching pace, and to be able to march at five miles an hour upon all particular occasions. Most of the powers on the continent have light infantry. It is only of late years that light infantry came to be used in the British army : But now every regiment has a company of light infantry, whose slation is on the left of the regiment, the right being occupied by the grenadiers.

INFATUATE, to prepoffels any one in favour of fome person or thing that does not deferve it, so far as that he cannot easily be disabused .- The word infatuate comes from the Latin fatuus "fool;" of fari, " to speak out," which is borrowed from the Greek que, whence parms, which fignifies the fame with vates in Latin, or prophet in English; and the reason is, because their prophets or priefts used to be seized with a kind of madness or folly, when they began to make

their predictions, or deliver oracles.

The Romans called those persons infatuati, who fancied they had feen visions, or imagined the god Faunus, whom they called Fatuus, had appeared to them,

INFECTION, among physicians. See CONTA- Infedion

INFEFTMENT, in Scots law, the folemnity of Infibulathe delivery of an heritable subject to the purchaser.

INFERIÆ, facrifices offered by the Romans to the Dii Manes, or the fouls of deceafed heroes or other illustrious persons, or even any relation or person whose memory was held in veneration. These facrifices confifted of honey, water, wine, milk, the blood of victims, variety of balfamic unquents, chaplets, and loofe flowers. The victims upon these occasions were generally of the fmaller cattle, though in ancient times they facrificed flaves or captives: But what a shocking view does this give us of their fentiments of human nature, as if nothing but murder, cruelty, and human blood, could fatisfy or prove acceptable to an human foul! The facrifices were usually black and barren. The altars on which they were offered were holes dug in the ground.

The honey, water, wine, &c. were used as libations, and were poured on the tombs of children by children. on those of virgins by virgins, and on those of married men by women. The inferiæ were offered on the 9th and 30th days after interment amongst the Greeks, and repeated in the month Anthesterion. The whole of this article applies equally to the Greeks and the Ro-

INFIBULATION, in antiquity. It was a cuflom among the Romans to infibulate their finging boys, in order to preferve their voices: for this operation, which prevented their retracting the prepuce over the glans, and is the very reverse to circumcifion. kept them from injuring their voices by premature and prepotterous venery : ferving as a kind of padlock, if not to their inclinations, at least to their abilities. It appears by fome passages in Martial, that a less decent ufe was made of infibulation among the luxurious Romans: for fome ladies of diffinction, it feems, took this method of confining their paramours to their own embraces. Juvenal also hints at some such practice. Celfus, a chatte author, faysinfibulation was fometimes practifed for the fake of health, and that nothing destroys it more than the filly practice this operation feems in-tended to prevent. This practice is not perhaps likely to be revived; if, however, any one who has fuffered in his conflitution by prepofterous venery, should be able to get children, and should be inclined to prevent the same misfortune in them by infibulation, the method of doing it is thus: The fkin which is above the glans is to be extended, and marked on both fides with ink, where it is perforated, and then fuffered to retract itself. If the marks recur upon the glans, too much of the skin has been taken up, and we must make the marks farther; if the glans remain free from them, they show the proper place for affixing a fibula: then pafs a needle and thread through the skin where the marks are, and tie the threads together; taking care to move it every day, until the parts about the perforations are cicatrifed: this being effected, take out the thread, and put in the fibula; which the lighter it is the better.

Authors have not determined what the fibula of the ancient furgeon was, though no doubt it was for different purposes. In the present case, the fibula

Infidelity. country people put through the nofes of fwine.

INFIDEL, a term applied to fuch persons as are not baptized, and that do not believe the truths of the

Christian religion. See DEIST.
INFIDELITY, in a general fense, denotes want

of faith or belief in regard to any subject or transaction. Religious INFIDELITY fignifies a difbelief of Christianity.

Of all the methods (fays an elegant modern Effayift *) which the vanity of man has devised with a view to acquire diffinction, there is none easier than that of professing a disbelief of the established religion. That which shocks the feelings of those with whom we converse, cannot fail of attracting notice; and as the vain are usually confident, they utter their doubts with an air fo oracular and decifive, as induces the fimple to think them profoundly wife. Audacity, with little ingenuity, will attract the eyes of spectators, and this will fufficiently answer the purpose of many among the professed unbelievers. One might be diverted, if one were not hurt, at feeing a circle of filly admirers, gaping and fixing their eyes on fome half-learned and impudent prater, who throws out oblique infinuations against the Bible, the clergy, or the facrament. These are fertile topics of wit and ingenuity; but it might mortify the vanity of some very vain writers and talkers, if they were to recollect, what is undoubtedly true, that it is a species of wit and ingenuity which not only the vileft, but the most stupid and illiterate of mankind, have frequently displayed in all its possible per-

There is indeed no doubt, but that vanity is one of the principal causes of infidelity. It must be the fole cause of communicating it to others, by writing or conversation. For let us suppose the case of a very humane, judicious, and learned man, entertaining doubts of the truth of Christianity: if he cannot clear his doubts by examination, he will yet recollect that doubts are no certainties; and, before he endeavours to propagate his fcepticism, he will ask himself these queftions: " Am I quite convinced that what I doubt of cannot possibly be true? If I am convinced of it, am I fure that the publication of my opinions will not do more harm than good? Is not the diffurbing of any long-established civil constitution attended with confufion, rebellion, bloodshed, and ruin? And are not the majority of men more flrongly attached to the religion than the government of their forefathers? Will it ferve my country to introduce discontent of any species? May not those innovations in religion, which discontent may introduce, lead to all the evils which are caused by frenzy and fanaticism? Granting that I

mudel, feems to mean a ring of metal, not unlike what the another kind; for do I read those books which have buildedity. been already written to fatisfy fimilar doubts? Nothing but the vanity of appearing to be wifer than my credulous neighbours can induce me to interrupt the happiness of their belief. But vanity of this fort, which tends to difturb fociety, to injure the national morals, and to rob many thousand individuals of a copious fource of fweet and folid comfort, must be pronounced extreme wickedness, even according to the obvious dictates of natural religion. I shall act the part of a good citizen and a good man, by conforming to a fystem whose beneficial influence I feel and confels, and by endeavouring to acquire a belief in that which has for fo many centuries been effablished, and which promifes to foothe me in diffress with the fweetest confolations, and to brighten the difmal hour of death, by the hope of a more glorious and happy state of existence. At all events, I shall have the fatisfaction of having commanded myfelf fo far, as not to have run the hazard of endangering the welfare of my fellow-creatures, either here or hereafter, by indulging a degree of vanity, which, in a creature fo weak and fo short-lived as myself, is a folly very inconfident with the superior wildom which I feem to arrogate.

"I will venture to repeat (continues our author), that all writers against Christianity, however they may affect even the extremes of benevolence, honour, philofohpy, and enlargement of mind, are actuated by vanity and wickedness of heart. Their motives are as mean, felfish, narrow, and in every respect unjustifiable, as the tendency of their writings is mischievous. Their malice is often impotent, through the foolith forhiftry of their arguments; but, if ever it be fuccessful, it is highly injurious: and indeed, confidering their motives and the probable confequences of their endeavours, the infidel writer is a greater enemy to fociety, and confequently guiltier, according to all the principles of focial union, than the thief or the traitor. Perfecution would, however, only promote his cause, and his pro-

per punishment is contempt.

"It is certainly no derogation from the character of a man of feufe, to conform, even while he is fo unfortunate as to doubt their truth, to the opinions of his country. His conformity will probably lead him to a train of actions and of thought, which, in due time, will induce him to believe. But, if that should not happen, yet he will act, as very wife and very great men have acted, in paying a respectful deference to the avowed conviction of others. The most intelligent and powerful men of ancient Rome, not only appeared to believe a very abfurd and hurtful fystem, but affisted in all its ceremonies as priefts. Even Socrates, who eviwere able to make a party formidable enough to crush dently entertained fome notions adequate to the digopposition and to exterminate Christianity, still am I nity of the one great and supreme Being, yet thought certain that I act, in this instance, like a good member it was a duty which he owed to his country, fo far to of fociety? For is not this fystem, whether well or ill conform to the wretched establishment, as to order in founded, friendly to fociety? I must confess it; its his dying words a facrifice to Alfculapius. This exgreatest enemies have acknowledged it. What motive ternal conformity to the national religion ought not to then can induce me to divulge my doubts of its authen- be confounded with hypocrify. If indeed it is carried ticity? Not the good of mankind; for it is already to extremes, or zealoufly affected, it certainly is very allowed by unbelievers, that the good of mankind is blameable and contemptible deceit; but while it keeps interested in the belief of its divine original. Is it for within the bounds of reason and moderation, it ought my own good, and with a view to be convinced? I to be called a decent deference to the opinions of the will not deceive myfelf; my motive, I suspect, is of majority, arising from humility, and from a defire to

Infraction informs against, or profecutes in any of the king's

tute. See INFORMATION.

Informers were very common both in Greece and Rome. Every corner of the streets was pestered with fwarms of turbulent rascals, who made it their constant business to pick up stories and catch at every occasion to accuse persons of credit and reputation: These by the Greeks were called Duxo821/21; for a more particular ac-

count of whom, fee the article Sycophant. Amongst the Romans, informers were of two forts, mandatores and delatores. These played into each other's hands; the former marking down fuch perfons as they pretended to have found guilty of any misdemeanor, and the other profecuting them. What tended to increase the number of these pestilent fellows was, that the informers were entitled to a fourth part of the effects of the persons convicted. Wicked princes rewarded and countenanced this mischievous tribe; but Titus fet on foot a most diligent fearch after them, and punished such as he found with death or banishment. Trajan also is praised by Pliny for a similar

INFRACTION, (formed from in, and the supine of frango, " I break,") a rupture or violation of a

treaty, law, ordinance, or the like.

INFRALAPSARII, the name of a fect of predeflinarians, who maintain, that God has created a certain number of men only to be damned, without allowing them the means necessary to fave themselves, if they would; and they are thus called, because they hold that God's decrees were formed infra lapfum, after his knowledge of the fall, and in confequence thereof; in contradiffinction to the SUPRALAPSARIANS.

INFRA-SCAPULARIS, in anatomy. See ANATOMY,

Table of the Muscles.

INFRA Spinatus, in anatomy. See ANATOMY, ibid. INFULA, in antiquity, was a mitre worn by the Romans and Grecian priefts, upon the head, from which on each fide hung a ribband. The covering the head with a mitre was rather a Roman than a Grecian cuftom, introduced into Italy by Æneas, who covered his head and face at the performance of facrifice, left any ill-boding omen should disturb the rites. The infulæ were commonly made of wool, and were not only worn by the priefts, but were put upon the horns of the victims, upon the altar and the temple. The infulæ were also called vitta.

INFUNDIBULIFORM, in botany, an appellation given to fuch monoperalous or one-leaved flowers as refemble a funnel in shape, or which have a narrow tube at one end, and gradually widen towards the limb

or mouth

INFUSION, in pharmacy, an operation whereby the virtues of plants, roots, and the like, are drawn out, by letting them fleep in some convenient fluid menstruum, without boiling them therein; since boiling is found to diffipate the finer parts of many bitter and aromatic fubitances, without carefully extracting their medicinal principles.

INGELSHEIM, a town of Germany, in the palatinate of the Rhine, remarkable for having been the refidence of the emperors; feated on the river Salva, on an eminence, from whence there is a charming pro-

fpect. E. Long. 8. 5. N. Lat. 49. 58.

INGENUOUS, in a general fenfe, fignifies open, Ingenuous Ingelsheim, courts, those that offend against any law or penal sta- fair, and candid. INGENUOUS, (ingenuus), in Roman antiquity, an Ingratitude,

appellation given to perfons born of free parents, who had never been flaves : for the children of the liberti, or perfons who had obtained their liberty, were called libertini, not ingenui; this appellation of ingenuus being reserved for their children, or the third genera-

INGESTA, is used by some authors to express all

forts of aliment taken into the body. INGLIS (Sir James), a Scottish poet who flourished towards the middle of the 16th century. According to Mackenzie, he was descended from an ancient family in Fifeshire, where he was born in the reign of James IV. He was educated at St Andrew's, went to Paris, and returned in the minority of James V. into whose favour he ingratiated himself by his poetry, having written fundry tragedies and comedies, and other poems, that were much applauded by good judges. He joined the French faction against the English; and, in some skirmishes preceding the fatal battle of Pinkie, fo diftinguished himself, that he was knighted on the field. After the loss of that day, he retired into Fife, and amused himself with his favourite studies; and in 1548 published at St Andrew's his noted Complaint of Scotland.* This is a well-written work for the time; and shows abundance of learning. He appears from it to have read much both in Greek and Latin authors, to have been well-skilled in mathematics and philosophy, and to have been a great lover of his country. Unpublished and in MS. (fays Mackenzie) are Poems, confisting of Songs, Ballads, Plays, and Farces. He died at Culrofs in 1554.

INGLUVIES, the crop or craw of granivorous birds, ferving for the immediate reception of the food, where it is macerated for fome time before it is tranf-

mitted to the true stomach.

INGOLSTADT, a handsome town of Germany, and the strongest in Bavaria, with a famous university and a handsome church. The houses are built with ftone, and the streets large. It is feated on the Danube, in E. Long. 11. 10. N. Lat. 48. 42.

INGOT, a mass of gold or filver melted down, and

cast in a mould, but not coined or wrought.

INGRAFTING, in gardening. See GRAFT-

INGRATITUDE, the opposite of gratitude. See

Ingratitude is a crime fo shameful, that there never was a man found who would own himself guilty of it; and, though too frequently practifed, it is fo abhorred by the general voice, that to an ungrateful person is imputed the guilt or the capability of all other crimes.

The ungrateful are neither fit to serve their Maker,

their country, nor their friends.

Ingratitude perverts all the measures of religion and fociety, by making it dangerous to be charitable and good-natured. (See GRATITUDE). However, it is better to expose ourselves to ingratitude than to be wanting in charity and benevolence.

Great minds, like Heav'n, are pleas'd with doing good; Though the ungrateful subjects of their favours Are barren in return.

ingratitude. 1. In a little work intitled Friendly Cautions to Officers, the following atrocious inftance of ingratitude is related. An opulent city in the west of England, little used to have troops with them, had a regiment fent to be quartered there: the principal inhabitants and wealthieft merchants, glad to show their hospita-lity and attachment to their sovereign, took the first opportunity to get acquainted with the officers, inviting them to their houses, and showing them every civility in their power. This was truly a defirable fituation. A merchant, extremely eafy in his circumflances, took fo prodigious a liking to one officer in particular, that he gave him an apartment in his own house, and made him in a manner absolute master of it, the officer's friends being always welcome to his table. The merchant was a widower, and had only two favourite daughters; the officer in fo comfortable a flation cast his wanton eyes upon them; and too fatally fucceeding, ruised them both. Dreadful return to the merchant's mifplaced friendship! The confequence of this ungenerous action was, that all officers ever after were flunned as a public nuisance, as a peft to fociety: nor have the inhabitants perhaps yet conquered their aversion to a red-coat.

2. We read in Rapin's History, that during Monmouth's rebellion, in the reign of James II. a certain person knowing the humane disposition of one Mrs Gaunt, whose life was one continued exercise of beneficence, fled to her house, where he was concealed and maintained for fome time. Hearing, however, of the proclamation, which promifed an indemnity and reward to those who discovered such as harboured the rebels, he betrayed his benefactress; and such was the fpirit of justice and equity which prevailed among the ministers, that he was pardoned and recompenfed for his treachery, while the was burnt alive for

her charity !

3. The following inftance is also to be found in the fame History .- Humphry Bannister and his father were both fervants to and raifed by the duke of Buckingham; who being driven to abfcond, by an unfortunate accident befalling the army he had raifed against the usurper Richard III. he without footman or page retired to Bannister's house near Shrewsbury, as to a place where he had all the reason in the world to expect fecurity. Bannister, however, upon the king's proclamation promifing 1000l. reward to him that should apprehend the duke, betrayed his master to John Merton high theriff of Shropshire, who fent him under a strong guard to Salifbury, where the king then was, and there in the market-place the duke was beheaded. But Divine vengeance purfued the traitor Bannister; for demanding the 1000l. that was the price of his master's blood, King Richard refused to pay it him, faying, " He that would be false to fo good a master, ought not to be encouraged." He was afterwards hanged for manflaughter, his eldeft fon run mad and died in a hog-fty, his fecond became deformed and lame, and his third fon was drowned in a fmall puddle of water. His eldest daughter was got with child by one of his carters, and his fecond was feized with a leprofy whereof the died .- Hift. of Eng. 8vo. vol. 1. p. 304.

The following barbarous instances are from ancient History.

4. When Xerxes king of Perfia was at Celene, a Ingratitude city of Phrygia, Pythius, a Lydian, who had his efidence in that city, and next to Xerxes was the most c opulent prince of those times, entertained him and his Vid. Herod opulent prince of those times, entertained find and his right whole army with an incredible magnificence, and made h. 7. 6. 38. him an offer of all his wealth towards defraying the Ira, l. 3. expences of his expedition. Xerxes, furprifed and c. 17. charmed at fo generous an offer, had the curiofity to inquire to what a fum his riches amounted. Pythius made answer, that having the design of offering them to his fervice, he had taken an exact account of them, and that the filver he had by him amounted to 2000 talents (about 255,000l. Sterling), and the gold to 4,000,000 of daries (about 1,700,000 l. Sterling). wanting 7000. All this money he offered him, telling him, that his revenue was fufficient for the fupport of his household. Xerxes made him very hearty acknowledgments, and entered into a particular friendship with him, but declined accepting his prefent. The fame prince who had made fuch obliging offers to Xerxes, having defired a favour of him fome time after, that out of his five fons who ferved in his army, he would be pleafed to leave him the eldeft, in order to be a comfort to him in his old age : the king was fo enraged at the proposal, though so reasonable in it. felf, that he caused the eldest son to be killed before the eyes of his father, giving the latter to understand, that it was a favour he spared him and the rest of his children. Yet this is the same Xerxes who is so much admired for his humane reflection at the head of his numerous army, "That of fo many thousand men, in 100 years time there would not be one remaining; on which account he could not forbear weeping at the uncertainty and instability of human things." He might have found another subject of reflection, which would have more justly merited his tears and affliction. had he turned his thoughts upon himself, and confidered the reproaches he deferved for being the inftrument of haltening the fatal term to millions of people. whom his cruel ambition was going to facilifice in an unjust and unnecessary war.

5. Bafilius Macedo the emperor, exercifing himfelf in Zonor. And hunting, a sport he took great delight in, a great stag nal, tom. 3. running furiously against him, fastened one of the P. 155. branches of his horns in the emperor's girdle, and pulling him from his horfe, dragged him a good diftance, to the imminent danger of his life; which a gentleman of his retinue perceiving, drew his fword and, cut the emperor's girdle afunder, which difengaged him from the beaft, with little or no hurt to his person. But observe what reward he had for his pains: " He was fentenced to lofe his head for putting his fword fo near the body of the emperor ;" and fuffered

death accordingly.

INGRESS, in aftronomy, fignifies the fun's entering the first scruple of one of the four cardinal figns,

efpecially Aries.

INGRIA, a province of the Russian empire, lying on the gulf of Finland, being about 130 miles in length, and 50 in breadth. It abounds in game and fish; and here are a great number of elks, which come in troops from Finland in the fpring and autumn. It was conquered by the Czar Peter the Great, and Pee tersburgh is the capital town. It is bounded by the river Nieva, and the gulf of Finland, on the north;

Livonia, on the west. Inguiphus.

INGROSSER, or Engrosser, in common law, is one who buys up corn growing, or any provisions by wholefale, before the market, to fell again. See FORE-STALLING.

It also fignifies a clerk, who writes records or instruments of law on skins of parchment. See Engros.

INGUEN, in anatomy, the same with what is other-

wife called groin. INGULPHUS, abbot of Croyland, and author of the history of that abbey, was born in London about-A. D. 1020. He received the first part of his education at Westminker; and when he visited his sather, who belonged to the court of Edward the Confessor. he was fo fortunate as to engage the attention of queen Edgitha. That amiable and learned prince's took a pleafure in examining our young feholar on his progress in grammar, and in disputing with him in logic; nor did she ever dismiss him without some present as a mark of her approbation. From Westminster he went to Oxford, where he applied to the study of rhetoric, and of the Aristotelian philosophy, in which he made greater proficency than many of his contemporaries. When he was about 21 years of age, he was introduced to William duke of Normandy (who vifited the court of England, A. D. 1051), and made himfelf fo agreeable to that prince, that he appointed him his fecretary, and carried him with him into his own dominions. In a little time he became the prime favourite of his prince, and the dispenser of all preferments, humbling fome, and exalting others, at his pleafure; in which difficult station, he confesseth, he did not behave with a proper degree of modefty and prudence. This excited the envy and hatred of many of the courtiers; to avoid the effects of which, he obtained leave from the duke to go in pilgrimage to the Holy Land, which was then become fashionable. With a company of 30 horsemen, he joined Sigfrid duke of Mentz, who, with many German nobles, bishops, clergy, and others, was preparing for a pilgrimage to Jerusalem. When they were all united, they formed a company of no fewer than 7000 pilgrims. In their way they fpent some time at Constantinople, performing their devotions in the feveral churches. In their paffage through Lycia, they were attacked by a tribe of Arabs, who killed and wounded many of them, and plundered them of a prodigious mafs of money. Those who escaped from this disafter, at length reached Terufalem, vifited all the holy places, and bedewed the ruins of many churches with their tears, giving money for their reparation. They intended to have bathed in Jordan; but being prevented by the roving Arabs, they embarked on board a Genoese fleet at Joppa, and landed at Brundusium, from whence they travelled through Apulia to Rome. Having gone through a long course of devotions in this city, at the feveral places distinguished for their fanctity, they separated, and every one made the best of his way into his own country. When Ingulph and his company reached Normandy, they were reduced to 20 half starved wretches, without money, cloaths, or horses: A faithful picture of the foolish disastrous

Ingroffer by Great Novogorod, on the east and fouth; and by journeys into the Holy Land, so common in those Inhalertimes. Ingulph was now fo much difgusted with the hubitions world, that he refolved to forfake it, and became a monk in the abbey of Fontenelle in Normandy : in which, after fome years, he was advanced to the office of prior. When his old mafter was preparing for his expedition into England, A. D. 1066, he was fent by his abbot, with 100 merks in money, and 12 young men, nobly mounted and completely armed, as a prefent from their abbey. Ingulph having found a favourable opportunity, prefented his men and money to his prince, who received him very graciously; some part of the former affection for him reviving in his bosom. In consequence of this he raised him to the government of the rich abbey of Croyland in Lincolnshire. A. D. 1076, in which he spent the last 34 years. of his life, governing that fociety with great prudence, and protecting their possessions from the rapacity of the neighbouring barons by the favour of his royal master. The lovers of English history and antiquities are much indebted to this learned abbot, for his excellent history of the abbey of Croyland, from its foundation, A. D. 664, to A. D. 1091, into which he liath introduced much of the general history of the kingdom, with a variety of curious anecdotes that are nowhere elfe to be found. Ingulph died of the gout, at his abbey, A. D. 1109, in the 79th year of his :

> INHALER, in medicine, a machine for breathing in warm steams into the lungs, recommended by Mr Mudge in the cure of the catarrhous cough. body of the instrument holds about a pint; and the handle, which is fixed to the fide of it, is hollow. In the lower part of the veffel, where it is foldered to the handle, is a hole, by means of which, and three others on the upper part of the handle, the water, when it is poured into the inhaler, will rife to the fame level in both. To the middle of the cover a flexible tube about five or fix inches long is fixed, with a mouth-piece of wood or ivory. Underneath the cover there is a valve fixed, which opens and shuts the communication between the upper and internal part of the inhaler and the external air. When the mouth is applied to the end of the tube in the act of inspiration, the air rushes into the handle, and up through the body of warm water, and the lungs become, confequently, filled with hot vapours. In expiration, the mouth being fill fixed to the tube, the breath, together with the steam on the surface of the water in the inhaler, is forced up through the valve in the cover. In this manner, therefore, the whole act of respiration is performed through the inhaler, without the necessity, in the act of expiration, of either breathing through the nofe, or removing the pipe from the mouth.

> INHERITANCE, a perpetual right or interest in lands, invefted in a person and his heirs.

> INHIBITION, a writ to inhibit or forbid a judge from farther proceeding in a cause depending before

> Sometimes prohibition and inhibition are put together, as of the fame import; but inhibition is most commonly a writ iffuing out of a higher court-christian

Informate to a lower; and prohibition out of the king's court to ken off from the pipe fixed in the veffel, fome of the Injection, an inferior court.

INBIBITION, in Scots law, a diligence obtained at the fuit of a creditor against his debtor, prohibiting him from felling or contracting debts upon his estate to the creditor's prejudice.

INHUMATION, in chemistry, a method of digesting substances, by burying the vessel in which they

are contained in horse-dung or earth-

INJECTION, the forcibly throwing certain liquid medicines into the body by means of a fyringe, tube, clyfter-pipe, or the like.

INJECTION, in furgery, the throwing in fome liquor or medicine into a vein opened by incilion. This practice, and that of transfulion, or the conveying the arterial blood of one man, or other animal, into another, were once greatly practifed, but are now laid odd.

Anatomical Interton, the filling the veffels of a human, or other animal body, with fome coloured fubtance, in order to make their figures and ramifications vifible.

I. The best account of the method of injecting the fanguiferous vessels of animals, is that by the late Dr Monro, published in the Medical Essays, vol. i. p. 79.

"The instrument with which the liquor is commonly thrown into the veffels is a tight easy going fyringe of brafs, to which feveral short pipes are fitted, and can be fixed by fcrews, the other extremities of these pipes being of different diameters without any ferew, that they may flide into other pipes, which are fo exactly adapted to them at one end, that when they are preffed a little together, nothing can pass between them: and because their cohesion is not so great as to resist the pushing force of the injection, which would drive off this fecond pipe, and spoil the whole operation; therefore the extremity of this fecond fort of pipes, which receives the first kind, is formed on the outside into a fquare, bounded behind and before by a rifing circle, which hinders the key that closely grasps the square part from fliding backwards or forwards; or a bar of brass must stand out from each side of it to be held with the fingers. The other extremity of each of these fecond fort of pipes is of different diameter; and near it a circular notch, capable of allowing a thread to be funk into it, is formed; by this, the thread tying the veffel at which the injection is to be made, will not be allowed to flide off.

" Besides this form described, common to all this fecond fort of pipes, we ought to have some of the larger ones, with an additional mechanism, for particular purposes; as, for instance, when the larger vessels are injected, the pipe fastened into the vessel ought cither to have a valve or a stop-cock, that may be turned at pleafure, to hinder any thing to get out from the vessel by the pipe; otherwise, as the injection, in fuch a case, takes time to coagulate, the people employed in making the injection must either continue all that while in the same posture; or, if the syringe is too foon taken off, the injected liquor runs out, and the larger vessels are emptied. When the syringe is not large enough to hold at once all the liquor necesfary to fill the veffels, there is a necessity of filling it again. If, in order to do this, the fyringe was to be ta-

ken off from the pipe fixed in the veffel, fome of the injection would be loft, and what was expofed to the air would cool and harden; therefore fome of the pipes ought to have a reflected curve tube coming out of their fide, with a valve fo difpofed, that no liquor can come from the firaight pipe into the crooked one, but, on the contrary, may be allowed to pass from the crooked to the firaight one: the injector then, taking care to keep the extremity of the reflected pipe immerfed in the liquor to be injected, may, as foon as he has pushed out the first fyringeful, fill it again by only drawing back the fucker; and, repeating this quickly, will be able to throw feveral fyringefuls into twe veffels.

" All these different forts of pipes are commonly

made of brass.

"The liquors thrown into the veffels, with a defign to fill the finall capillary tubes, are either fuch as will incorporate with water, or fuch as are oily; both kinds have their advantages and inconveniences; which I fhall mention in treating of each, and fhall conclude with that which I have found by experience to fuceced befit.

" All the different kinds of glue, or ichthyocolla, fyths, common glue, &c. diffolved and pretty much diluted, mix eafily with the animal-fluids, which is of great advantage, and will pass into very small vessels of a well-chosen and prepared subject, and often ans fwer the intention fufficiently, where the defign is only to prepare fome very fine membrane, on which no veffels can be expected to be feen fo large as the eye can discover whether the transverse sections of the veffels would be circular, or if their fides are collapfed. But when the larger vessels are also to be prepared. there is a manifelt disadvantage to the usefulness and beauty of the preparation; for if nothing but the glutinous liquor is injected, one cannot keep a subject so long as the glue takes of becoming firm; and therefore, in diffecting the injected part, feveral veffels will probably be cut and emptied. To prevent this, one may indeed either foak the part well in alcohol, which coagulates the glue; but then it becomes so brittle. that the least handling makes it crack; and if the preparation is to be kept, the larger vessels appear quite shrivelled, when the watery part of the injection is evaporated: or the efflux of the injection may be prevented, by carefully tying every veffel before we are obliged to cut it; still, however, that does not hinder the veffels to contract when the glue is drying. If, to obviate these difficulties, the glutinous liquor should first be injected in fuch quantity as the capillary vessels will contain, and the common oily or waxy injection is pushed in afterwards to keep the larger vessels distended, the wax is very apt to harden before it has run far enough; the two forts of liquors never mifs to mix irregularly, and the whole appears interrupted and broken by their foon feparating from each other; which is still more remarkable afterwards, when the watery particles are evaporated.

"Spirits of wine coloured mixes with water and oils, and fo far is proper to fill the very fmaller verfels with: but, on the other hand, it coagulates any of our liquor it meets, which fometimes blocks up the veffels for much, that no more injection will pafs; then

it

Injection. It fearce will fulpend fome of the powders that prove the most durable colours; and as it entirely evaporates, the vessels must become very small; and the small quantity of powder left, having nothing to serve for connecting its particles together, generally is seen so interrupted, that the small ramifications of vessels rather have the appearances of random scratches of a pencil,

than of regular continued canals.

"Melted tallow, with a little mixture of oil of turpentine, may fometimes be made to fill very small veficls, and keeps the larger ones at a full stretch; but where any quantity of the animal liquors are fill in the vessels, it is liable to stop too soon, and never can be introduced into numbers of vessels which other liquoes enter; and it is so brittle, that very little hand-

ling makes it crack, and thereby renders the preparation very ugly (A).

"The method I have always incoceeded beft with, in making what may be called fubtile or fine injections, is, first to throw in coloured oil of turpentine, in funda quantity as might fill the very small vessels; in such a quantity as might fill the very small vessels; and, immediately after, to push the common coarse injection into the larger ones. The oil is subtile enough to enter rather smaller capillary tubes than any colouring can; its resinous parts, which remain after the sprittuous are evaporated, give a sufficient adhesion to the particles of the subtilance with which it is coloured, to keep them from separating, and it intimately incorporates with the coarser injection; by which, if the sinjection is rightly managed, it is impossible for the sharpest eye to discover that two forts have been made use of (a).

" All the liquors with which the veffels of animals are artificially filled, having very faint, and near the fame colours, would not all appear in the very fmall veffels, because of their becoming entirely diaphanous, without a mixture of fome fubftance to impart its colour to them; and where feveral forts of even the largest vessels of any part were filled, one fort could not be diftinguished from another, unless the colour of each was different; which has likewife a good effect in making preparations more beautiful. Wherefore anatomists have made use of a variety of such substances, according to their different fancies or intentions; fuch as gamboge, faffron, ink, burnt ivory, &c. which can be easily procured from painters. My defign being only to confider those that are fit to be mixed with the injecting liquors proposed to fill capillary vessels, which is fearce ever to be done in any other, except the branches of the arteries and of some veins, I shall confine myfelf to the common colours employed to these last

named two forts of veffels, which colours are red, green,

and fometimes blue, without mentioning the others,

which require very little choice.

" Anatomists have, I imagine, proposed to imitate Injection. the natural colours of the arteries and veins in a living creature, by filling the arteries with a red fubstance, and the veins with a blue or green: from which, however, there are other advantages, fuch as the strong reflection which fuch bodies make of the rays of light, and the unaptness most such bodies have to transmit these same rays, without at least a considerable reflection of the rays peculiar to themselves; or, in other words, their unfitness to become completely pellucid: without which, the very fine veffels, after being injected, would ftill be imperceptible. The animal or vegetable substances made use of for colouring injections, fuch as chochineal, laque, rad. auchufa, brazilwood, indigo, &c. have all one general fault of being liable to run into little knots which stop some of the veffels; their colour fades fooner when kept dry; they more eafily yield their tincture when the parts are preferved in a liquor; and rats, mice, and infects, will take them for food; for which reasons, though I have frequently fucceeded in injecting them. I rather prefer the mineral kind, fuch as minium or vermilion for red: of which this last is, in my opinion, the best, because it gives the brightest colour, and is commonly to be bought finely levigated. The green-coloured powder generally used is verdigrease; but I rather choose that preparation of it called distilled verdigrease; because its colour is brighter, and it does not fo often run into fmall knots as the common verdigreafe, but diffolves in the oily liquors.

" The method of preparing the injection composed of these materials, is to take for the fine one, a pound of clear oil of turpentine, which is gradually poured on three ounces of vermilion, or diffilled verdigreafe finely powdered, or rather well levigated by grinding on marble; stir them well with a small wooden spatula till they are exactly mixed, then strain all thro' a fine linen rag. The feparation of the groffer particles is, however, rather better made, by pouring some ounces of the oil upon the powder, and, after stirring them together strongly, stop rubbing with the spatula for a fecond or fo, and pour off into a clean veffel the oil with the vermilion or verdigreafe fufpended in it; and continue this fort of operation till you observe no more of the powder come off; and all that remains is granulated. The coarfer injection is thus prepared: Take tallow, I pound; wax, bleached white, 5 ounces; fallad oil, 3 ounces; melt them in a skillet put over a lamp: then add Venice turpentine, 2 ounces; and as foon as this is diffolved, gradually sprinkle in of vermilion or verdigreafe prepared, 3 ounces; then pass all through a clean, dry, warmed linen-cloth, to feparate all the groffer particles; and, when you defign to make it run far into the veffels, fome oil

(a) Mr Ranby's injecting matter, as published by Dr Hales, (Hamash. Ex. 21.), is white rosin and tallow, of each two ounces, melted and strained through linen; to which was added three ounces of vermilion, or finely

ground indigo, which was first well rubbed with eight ounces of turpentine varnish.

)£

⁽a) Rigierus (Introduc, in natitiam rerum natur, &c. 410, Hugua, 1743, titul. Balfamun) gives Ruyfch's method of injecting and preferving animals, which, he fays, Mr Blumentrot, prefiletur of the Peterflurgh academy, affured him was copied from the receipt given in Ruyfch's own hand-writing to the Czar. According to this receipt, melted tallow, coloured with vermilion, to which, in the fummer, a little white wax was added, was Ruyfch's injecting eracta materia.

Injection of turpentine may be added immediately before it is perience; at leaft, however, care ought to be taken, injection. that the whole fubject, or part macerated, is per-

"The next thing to be confidered, and indeed what chiefly contributes to the fuccess of injections, is the choice and preparation of the subject whose vessels are

to be filled.

"In choofing a fit fubjech, take thefe few general rules: 1. The younger the creature to be injected is, the injection will, caterix paribus, go fartheft, and vice werfu. 2. The more the creature's fluids have been diffedved and exhaulted in life, the fueces for the operation will be greater. 3. The lefs fold the part defigned to be injected is, the more welfels will be filled. 4. The more membranous and transparent parts are, the injection flows better; whereas, in the folid very hard parts of a rigid old creature, that has died with its veffels full of thick flrong blood, it is fearce poffible to inject

great numbers of fmall veffels. " Therefore, in preparing a subject for injecting, the principal things to be aimed at, are, To diffolve the fluids, empty the veffels of them, relax the folids, and prevent the injection's coagulating too foon. To aniwer all these intentions, authors have proposed to inject tepid or warm water by the arteries, till it returns clear and untinged by the veins, and the veffels are thereby fo emptied of blood, that all the parts appear white; after which, they push out the water by forcing in air; and, lastly, by pressing with their hands, they fqueeze the air also out. After this preparation, one can indeed inject very fubtilely; but generally there are inconveniences attend it. For in all the parts where there is a remarkable tunica cellulofa, it never miffes to be full of the water, which is apt to fpoil any parts defigned to be preferved either wet or dry; and fome particles of the water feldom mifs to be mixed in the larger as well as fmaller veffels with the oily injection, and make it appear difcontinued and broken; wherefore it is much better to let this injection of water alone, if it can be possibly avoided, and rather to macerate the body or part to be injected a confiderable time in water, made so warm (c) as one can hold his hand eafily in it; taking care to keep it of an equal warmth all the time, by taking out some of the water as it cools, and pouring in hot water in its place; by which the veffels will be fufficiently foftened and relaxed, the blood will be melted down, and the injection can be in no danger of hardening too foon; whereas, if the water is too hot, the veffels shrink, and the blood coagulates. From time to time we fqueeze out the liquids as much as possible at the cut vessel by which the injection is to be thrown in (D). The time this maceration is to be continued, is always in proportion to the age of the subject, the bulk and thickness of what we defign to inject, and the quantity of blood we obferve in the veffels, which can only be learned by ex-

perence; at least, however, care ought to be taken, that the whole subject, or part macerated, is perfectly well warmed all through; and that we continue the pressure with our hands till no more blood can be brought away, whatever position we put the subject in.

When the fyringe, injections, and fubject, are all in readiness, one of the second fort of pipes is chosen, as near to the diameter of the veffel by which the injection is to be thrown as possible; for if the pipe is too large, it is almost needless to tell it cannot be introduced. If the pipe is much fmaller than the veffel, it is fearce possible to tie them so firmly together, but, by the wrinkling of the coats of the veffel, fome fmall paffage will be left, by which part of the injection will fpring back on the injector in the time of the operation, and the nearest vessels remain afterwards undiflended, by the lofs of the quantity that oozes out. Having chosen a fit pipe, it is introduced at the cut orifice of the veffel, or at an incision made in the side of it; and then a waxed thread being brought round the veffel, as near to its coats as possible, by the help of a needle, or a flexible eyed probe, the furgeon's knot is made with the thread, and it is drawn as firmly as the thread can allow; taking care that it shall be funk into the circular notch of the pipe all round, otherwife it will very eafily flide off, and the pipe will be brought out probably in the time of the operation, which ruins it.

"If there have been large veff.ds cut, which communicate with the veff.es you defign to inject, or if there are any others proceeding from the fame trunk, which you do not refolve to fill, let them be all carefully now tied up, to fave the injected liquor, and make the operation fucceed better in the view you then have.

"When all this is done, both forts of injections are to be warmed over a lamp, taking care to flir them constantly, left the colouring powder fall to the bottom and burn (E). The oil of turpentine needs be made no warmer than will allow the finger to remain in it, if the subject has been previously well warmed in water; when the maceration has not been made, the oil; ought to be scalding hot, that it may warm all the parts which are defigned to be injected. The coarse injection ought to be brought near to a boiling. In the mean time, having wrapt feveral folds of linear round the parts of the fyringe which the operator is to gripe, and fecured the linen with thread, the fyringe is to be made very hot by fucking boiling water feveral times up (F), and the pipe within the veffel is to be warmed by applying a fponge dipped in boiling wa-

"After all is ready, the fyringe being cleared of the water, the injector fills it with the finer injection;

(c) Ruyfch orders a previous maceration for a day or two in cold water; which must have a better effect in melting the blood than warm water has.

(p) When Ruysch intended to inject the whole body, he put one pipe upwards, and another downwards, in the descending aorta.

(E) Ruysch melts his tallow by the heat of warm water, into which he puts the vessel containing the injection.

(F) He warms his fyringe by laying it on hot coals.

(c) He warms his pipe, by putting the body, after the pipe is fixed in the vessel, into hot water. When

Injection. and then introducing the pipe of the fyringe into that in the veffel, he preffes them together, and either with one hand holds this last pipe firm, with the other gripes the fyringe, and with his breaft pushes the fucker; or, giving the pipe in the veffel to be held by an affiftant, in any of the ways mentioned in the description of these forts of pipes, he gripes the fyringe with one hand, and pushes the sucker with the other, and consequently throws in the injection, which ought to be done flowly, and with no great force, but proportioned to the length and bulk of the part to be injected and ftrength of the veffels. The quantity of this fine injection to be thrown in is much to be learned by use. The only rule I could ever fix to myfelf in this matter was to continue pushing till I was sensible of a stop which would require a confiderable force to overcome. But this will not hold where all the branches of any veffel are not injected; as for instance, when the vessels of the thorax only are to be injected: for the aorta bears too great a proportion to the branches fent from it, and therefore less fine injection is requisite here. As foon as that stop is felt, the sucker of the syringe is to be drawn back, that the nearest large vessels may be emptied. Then the fyringe is taken off, emptied of the fine injection, and filled with the coarfer, which is to be pushed into the vessels quickly and forcibly, having always regard to the strength and firmness of the veffels, bulk, &c. of the part. Continue to thrust the fucker, till a full ftop, or a fort of push backwards, is felt, when you must beware of thrulling any more, otherwise some of the vessels will be bursted, and the whole, or a confiderable share of the preparation you defigned, will be spoiled by the extravalation, but rather immediately stop the pipe by the turn-cock, and take out the fyringe to clean it, and allow fufficient time for the coarse injection to coagulate fully, before any part is diffected. Ruysch, immediately after throwing in the injection, put the body into cold water, and flirred it continually for fome time, to prevent the vermilion to separate from the tallow."

II. The injection of the lymphatic fystem is much more difficult than that of the fanguiferous, on account of the extreme fmallness of the vessels; so that till very lately it was almost quite impracticable. Methods indeed had been attempted for this purpofe; but by reafon of the improper form of the instruments, and the inferior skill of anatomists in former times, we may juftly look upon this as one of the most modern im-

provements in anatomy.

The first thing to be confidered, when the lymphatics are to be injected, is a proper method of discovering them; for this is by no means an easy matter, on account of their smallness and transparency .- To find out these vessels, the subject must be viewed in a proper place, where the light is neither very ftrong nor very weak. Mr Sheldon, who has written a treatife upon this subject, recommends a winter forenoon from ten to two; it being chiefly in the winter feafon that anatoanical preparations are made, and because at that time of the day the light is more clear and fleady. He fays also from his own experience, that the light paffing through the glass of a window is better for this purpose than the open air, as the vessels are more distinctly feen. The injecting of the veffels is likewife Injectionrendered more difficult in the open air by the eafe with which the humidity is evaporated from them. It will likewise be necessary to incline the part in various ways to the light, as some of the vessels are most eafily discoverable in one position and some in another. The lacteal trunks under the peritioneal coats of the intestines, and the lymphatics on the external furface of the liver, &c. particularly require this method. He discommends the use of magnifying glaffes. " I am perfuaded (fays he), that those who attempt to find them through this medium, will not acquire that vifus eruditus which is obtained to a furpriting degree by those who have been much experienced in injecting lymphatic veffels. A lateral light is likewise preferable to an horizontal, or even to an oblique fky-light.

"The fubjects must be laid upon a table of fufficient height, which might be contrived with a ledge fixed to the table in fuch a manner as to be water proof; which would be useful for preventing the quicksilver, which is almost always necessary for injecting these veffels, from being loft. The furface of the table should likewife be hollowed, fo that the mercury which falls may be collected in the middle, where an hole with a stopper may be made to take out occasionally the quickfilver which collects. Such a table would also be convenient for holding water for the purpose of steeping membranous parts which are frequently to be injected; and which, from being exposed to the air, become dry; which also it is inconvenient and hazardous to move into water during the time of operation. Even a common table with a hole cut in the middle may answer the purpose: the hole may be round or fquare according to the fancy of the anatomist; but the table must be constructed of such materials as are not liable to warp in warm water. Should the anatomift not be provided with either of these tables, the parts must be laid in a tray or earthen dish, that the quickfilver may be faved."

The materials for injecting these vessels are only quickfilver, and the ceraceous or coarfe injection of anatomists; the former being always used in injecting the lymphatics and lacteals, it being almost impossible to fill them with another fluid in the dead body. The ceraceous injection is chiefly used for the thoracic duct; and in some particular instances, where the lymphatic trunks have been found larger than the ordinary fize, a coarse injection has been made use

Injections of the lymphatics may be made even while the animal is alive, and that without any great cruelty, by feeding it with milk previous to its being ftrangled. Of all the barbarous methods of opening the animal while alive, the most useful feems to be that of Mr Hunter, who directs to perforate the small intestines, and throw in starch-water with folutions of musk, or indigo and starch water. " In a word (favs Mr Sheldon), any gelatinous fluids rendered opaque with fuch colours as will be absorbed, are extremely useful for experiments of this kind; for much more may be feen by examining the veffels diftended with a coloured fluid from natural absorption, than by ana-

this to be is done, a cork ought to be put into the pipe, to prevent the water getting into the vessel that is to be injected.

NI

Injection. tomical injection practifed in the dead body." Liberkuhn first discovered the ampullulæ by feeding children in whom the lacteal glands were obstructed previous to their death with milk; by which means not only the lacteal trunks became diftended with chyle, but likewife the ampullulæ, Thus abforbing mouths of the lacteal veffels were discovered by Liberkuhn; and in a fimilar manner Afellius discovered the lacteals themselves. Thus also Eustachius discovered the thoracic duct in a horse; and Mr Hewson traced the lacteal veffels, lymphatics, and thoracic duct, in birds, by making ligatures on the root of the melentery, and other parts, which had been previously fed with barley. Mr Hunter likewife was enabled to obferve the lacteals of a crocodile when diftended with chyle.

The coarse injection for the lymphatics is made or mutton-fuet and yellow refin, in the proportion of two thirds of refin to one of fuet. If required of a thicker confiftence, we may add a fmall quantity of pure wax; if of a fofter quality, we may augment the quantity of fuet: Orpiment or king's yellow is generally made use of: though others are equally proper, provi-

ded they be fine enough.

The instruments necessary for injecting the lymphatic veffels are the injecting tube and pipes, lancets, blow-pipes, knives, sciffars, forceps, needles, and thread. The old injecting tube has been found in a manner entirely useless, the pipe being fixed in a glass tube two or three feet long; which is one of the reasons why, before the time of Hewson, so little of the lymphatic fystem could be injected. Tubes of such a length are entirely unmanageable by one person, and it is imposfible to perform the operation properly with two. To perform it in the best manner, the instrument should be held in the hand like a pencil or pen. The inftruments used by our author are tubes made either of glass or of brass; which, when filled with mercury, may be held in the hand like a pen: a glass tube, however, is preferable to the metallic one. It is fomewhat in the shape of a trumpet; fix inches and an half in length, an inch and an half broad where broadest, and three eighths of an inch where narrowest. A collar of steel half an inch broad and three quarters of an inch long is cemented to this pipe, and a smaller tube of the same metal is screwed upon the end of the collar: the whole terminating in a capillary tube about an inch in length. This last is the most difficult part of the whole work to execute; it should be drilled out of a folid piece of metal, and not made of a thin bit of plate foldered, as these are apt to turn ragged in the edges, and the folder is also liable to be destroyed by the mercury. Those used by Mr Sheldon were made by drilling a small hole lengthwise through a bit of well-tempered wire. It is cleaned by means of a very fmall piece of fteel-wire capable of paffing through the bore of the tube. This ought to be annealed left it should break; in which case the broken bit could not eafily be got out. Very fmall tubes may be made of glass drawn out as fine as we choose; and though very apt to break, they are easily repaired. They ought to be very thin, that they may be eafily melted. Sometimes it has been found convenient to fit the collar with a steel stop-cock.

Vol. IX. Part I.

nine inches and an half in length, and half an inch wide Injection, where wideft. The collar is a full quarter of an inch broad, and three quarters of an inch long; a fteel piece

and capillary tube being fcrewed to it as in the other. The lancets are to be exquifitely fharp, in order to cut into the lymphatic veffels. The latter are eafily inflated by the fmall filver blow-pipes ufually put up in the diffecting cases by the London mathematical inftrument makers: diffecting knives, fine-pointed feiffars, accurately made diffecting forceps, with ftraight or crooked needles, are likewife fubflituted with advantage, as not being affected by the quickfilver.

We must next consider the proper subjects for injection. Mr Sheldon recommends, that they should be as free from fat as possible; he has always found in the human subject those who died universally dropsical, or of an afcites or anafarca, to be the best, for the following reasons, viz. in such there is little or no animal oil, and but a very small quantity of red blood: both of which, when they occur in great abundance, very much impede the discovery of the lymphatic veffels; but when the cellular veffels are loaded with water, the absorbents are more readily traced, and with less risk of wounding them in diffection : the preparations also, particularly the dried ones, are more lasting. This circumstance is found to be of most confequence in preparing the absorbent vessels of the trunk and extremities of the human subject. Of all the vifcera in young fubjects, only the liver and lungs can be injected with fuccess; and these may be successfully injected even in the foctus. It will be most proper to begin the operation upon the subject immediately after death, as lymph or chyle will then be more readily found in the vessels, than when we wait a longer time. In preparing the lacteals, previoufly diftended with milk in the living subject, it is proper to have the intestines and mesentery plunged (with the ligature upon the root of the latter) into rectified spirit of wine. This process will coagulate the chyle; and the fluid being opaque, the veffels will be beautifully feen when we mean to prepare the parts. by preferving them in proof-spirit as wet specimens: "In this way (fays Mr Sheldon) I have made in the dog one of the most natural preparations that can be feen of the lacteals injected from their orifices by the natural abforption." We may also prepare the lacteals by the method used by Mr Hunter, already mentioned; by which they will be very confpicuous, by the indigo absorbed from the cavity of the intestines. By twing the thoracic duct near its infertion into the angle formed between the fubclavian and jugular veins on the left fide, or by tying these veins on both fides, we may diftend almost all the absorbents of the animal. Thus we are enabled to purfue these vesiels in many parts where they have not yet been discovered, where they can scarcely be traced by injection, and even in fome parts where it is utterly impossible for the injections to reach them. Another method fometimes fuccefsfully used by our

author, was first practised by Malpighi. In this the part is to be fleeped in water, and the liquid changed as long as it appears tinged with blood; fuffering the parts afterwards to remain in the fame water till the putrefaction hegins. As foon as this begins to take The brass tube represented by our author is about place, the air which is extricated will distend the lym-

Injections phatics, so that they may be easily seen, and then in- then tie the vessel. This, however, should always be sujection. jected with quickfilver. It is, however, remarkable, avoided if possible; because, if not very dexterously perthat this method will not in general answer so well in formed, the operator will be apt to separate the tube the human species as in quadrupeds; the air having never passed by putrefaction into the human lacteals in any of the fubjects which Mr Sheldon tried, though it will take place in those of the horse or ass, and many other animals; drawing of the lacteals may likewife be made in this method to very great advantage. In some parts of the human body also, this method may be employed to advantage; as the liver, heart, &c. It may likewise be useful to make ligatures on the large trunks of the veffels previous to the maceration, that thus the air may be confined as foon as it is extricated from the coats by putrefaction. Our author adds, that if ligatures were made upon the wrifts and legs in articulo mortis, or immediately after death, the lymph would be stopped in the vessels, the latter would become diftended, and might be injected with the greatest facility by the common method after taking off the ligature. Mr Sheldon in fuch a cafe recommends the tourniquet. "I have reason (favs he) to believe, that abforption goes on as long as mufcular irritability remains: which last continues a confiderable time after the general life of the animal is loft." On this, however, we cannot forbear to remark, that making ligatures for fuch purpofes upon a human creature in articulo mortis, or even immediately after death, favours fo much of barbarity, that we cannot think it will be often practifed. In some cases, even in the dead fubject, ligatures are ufeful; as when we are fearching for the lymphatics in the fingers and toes. In these it is useful to stroke up the parts with the finger, by which means the fmall quantity of lymph remaining in the veffels will be forced upwards, and stopped by the ligature; after which the veffels may be eafily injected with quickfilver, as already men-

To inject the veffels, we must open one or more of them, directing the point of the lancet almost always towards the trunk or trunks of the veffels, and taking care not to carry the incision through the opposite fide. If the veffels happen to lie under the peritoneum as the lacteals, or under the pleura as the lymphatics of the lungs, we may cut into their cavity through these membranes. In injecting those of the extremities, however, and in many other parts of the body, it is absolutely necessary to diffect the vessels we defign to fill away from the fat and reticular fubstance before we attempt to open them with the lancet. The tube with the pipe affixed to it is previously to be filled with mercury: the anatomist then inflates the vessel by means of the blow-pipe, takes the tube from the affiftant, and introduces the small tube into the puncture. In this operation it will be found necessary not to carry the tube farther into the veffel than is fufficient to give the mercury a free paffage; for if we introduce it farther, the passage of the mercury will be impeded by the pipe being pushed against the side of the vessel. Should not the fluid be able to effect a passage, it will then be necessary to press upon the surface of it in the tube with our fingers. If it defcend freely, and without any of it passing between the side of the vessel and fmall pipe, we have only to fill up the tube with mercury as the latter descends; but if it gets out, we must

from the veffel; and on this account the puncture ought always to be very fmall, no larger indeed than is necessary to allow the pipe to get in with difficulty. As the injection proceeds, the pressure upon the surface of the quickfilver must be carried on higher and higher in the course of the lymphatic, till we come near the gland or glands into which the vessels terminate; otherwise we shall feldom get the cells of the glands, or the veffels emerging from the opposite fide of the glands, well injected. In injecting the lympha-tic veffels of the extremities, it will be ufeful to raife the part where the pipe is inferted higher than the other end of the limb, and to make the affiltant prefs with his hands along the skin in the course of the veffels, which will favour the progress of the injection. When the veffels are fufficiently filled, which may be known by the swelling of them, and by the resistance the mercury meets with, the affiltant passes a ligature about the veffel and ties it above the puncture before the anatomist withdraws the injection pipe.

The method of injecting the larger trunks or thoracic duct with the coarse injection is exactly similar to that already described for the fanguiferous vessels. Mr Sheldon, however, recommends the use of some pipes of a particular construction invented by himfelf. The improvement confifts in shaping the ends of the pipes like a pen; taking care to make the edges and point blunt, to avoid cutting the veffel when we introduce them. Thus much larger tubes than those commonly in use may be admitted; and there is no occafion to make any bulb or rising near the extremity of these small pipes to prevent the thread from slipping off: for this will certainly hinder us from inferting pipes of fuch diameter as might otherwise be done.

Having thus shown the method of injecting the lymphatics, our author next proceeds to describe the method of diffecting and preparing them either for immediate demonstration, or for preservation for any length of time. In the diffection, great care is requifite, on account of the exquisite thinness of their coats; but if this should happen by accident, it will then be necessary to introduce the pipe at the ruptured part; and having fecured it above and below with ligatures, to fill it again as before directed. Our author recommends, for the purpose of diffection, such knives as are made use of by the Germans and French in tracing the nerves. They must be made thin in the blade like lancets, and not much larger. A variety of different shaped blades, some fingle and others doubleedged, will be necessary for various parts of the body; the fault of the common diffecting knives being that they are too thick in the blade, which makes them foon blunt, and occasions the trouble of perpetual grinding, which is not the cafe with those just recommended. A sharp-pointed forceps is necessary, in order to lay fast hold of the smallest portion of cellular fubflance; but they ought not to be fo fharp as to endanger the puncturing of the veffels; nor should they by any means be bowed or stiff in the spring, to prevent the fingers of the operator from being wearied in the operation. They should also be made in such a manner as to hold large as well as small portions of rezicular Injection. ticular fubfiance. For diffections of this kind, finepointed feifiars and lancets fixed in handles are formtimes necediary; and it is frequently of ufe to plunge
the parts into water, in order to loofen the reticular
membrane connected with the outfide of the coats of
the veffels; by which means they may be diffected
more cafily, and with lefs danger of wounding them.
The blood may be extracted by frequently changing
the water. After being injected with quickfilver, the
parts flould not be allowed to remain long in the wawight after being injected with quickfilver, the
parts flould not be allowed to remain long in the wawight after being injected with quickfilver, the
parts floud not be allowed to remain long in the wa-

ter, because the volatile alkali formed by putrefaction is apt to change the colour of the mercury.

The diffection being performed, the preparation is then to be preferred either in a wet or dry flate, according to its nature. Preparations of the larger parts, as the trunk or extremities, should be preferred dry; and to dry them effectually, they should be exposed to a free current of air, but not to the rays of the surject on the result of the surject of the su

position, and handled as little as possible.

To make preparations of the thoracic duct, we must in the first place fill the aorta, vena cava superior, and vena azygos or intercostalis, with coarse injection; then fill, with the fame, the veffels below the right crus or little muscle of the diaphragm. The duct is fometimes prepared with quickfilver; but Mr Sheldon recommends to anatomists to make drawings of any thing new or remarkable in their preparations of the lymphatic veffels with quickfilver; as most of those specimens, particularly such as are dried, become at last totally useless by reason of the drying of the vesfels and the efcape or blackening of the mercury; or from the varnish growing more and more opaque with age. The quickfilver injection, however, in fome cases is very useful. Thus, for instance, if we wish to demonstrate the valves in the thoracic duct, or any other large absorbent vessel, we need only inject the veffels with quickfilver, diffect and dry them, then cut them open, and let the mercury run out; after which the valves will appear by making fections in the coats of the veffels. This may be done ftill better by varnishing the veffels three or four times before the fections are made ; because the varnish will strengthen the sides of the vessel. In wet preparations the valves in the cavities of these parts may likewise be demonstrated by opening them; or by inverting the veffels and fufpending them in proof malt-fpirits. Thus the valves that cover the terminations of the thoracic duct on the infide of the angle formed between the jugular and fubclavian veins on the left fide, and those which terminate the lymphatics on the right fide of the neck, arm, and lungs, may be beautifully demonstrated. Specimens of the lacteal veffels, of the absorbents of the heart, lungs, liver, spleen, diaphragm, kidneys, &c. may be kept wet or dry, according to the particular nature of the preparation or view of the anatomist. Some preparations are the better for being dried and afterwards immerfed in vials full of oil of turpentine; by which means the flesh will be rendered transparent,

thod is, that the parts on which the veffels pass, do not at all preserve their natural bulk by reason of their shrinking up; and as the wet preparations are free from this inconvenience, Mr Sheldon does not hesitate at affigning them a decided fuperiority over the dry ones .- Sometimes it is necessary to fix the preparations upon stiff paper or pasteboard, on account of their weight after being injected with mercury. The paper or pasteboard on which they are fastened ought to be of various colours, according to the nature of the preparation, in order to form a proper ground for showing the lymphatic veffels. Such fmall preparations as are preferved in spirits, or oil of turpentine, may be kept in bottles well closed with stoppers; and the larger in common preparation glasses. Our author describes a fimple method of stopping the mouths of these preparation glaffes, by which means the stopper is rendered nearly as durable as the glass itself, " In order to execute it, let the anatomist take care to have the upper furface of his bottles made plane, by defiring the workmen at the glass-house to flatten them in the making. This they will eafily do in forming the round ones, but the flat bottles are attended with confiderable difficulty. The right way to make them, I believe, would be to blow them in moulds of various fizes; the workman should likewise form the bottoms of the bottles perfectly flat, that the may fland upright and fleady. Bottles of this form being provided for the larger preparations, we grind the upper furface of them on a plain plate of lead, about a quarter of an inch thick, and two feet in diameter; first with fine emery and water, then with powdered rotten stone, or putty first wet. with water and at last dry; fo that the furface may be reduced to an exact horizontal plane, and of as fine a polish as plate-glass. This will soon be done, as the manoeuvre requires but little dexterity; and the anatomist should be provided with a considerable number of these glasses prepared as above directed. To the top of each bottle a piece of plate-glass, cut by a diamond, is to be adapted fo as completely to cover, but not project over, the edge of the bottle. When thefe two fmooth furfaces are put upon each other, with a drop of water between, the attraction of cohefion is fo confiderable, that it requires great force to separate

Many preparations of the lymphatics, and other parts preferved in bottles, do not require any firings to fuspend them ; particularly when fixed on pasteboard or paper: fuch as require suspension should be tied to ftrings fixed to the preparation below, and to small holes drilled in the substance of the glass at the bottom of the neck; or to fmall bits of glass that may be fixed on the infide of the fame part. The preparation is thus suspended in limpid proof malt-spirit, the bottle being almost completely filled; the upper and polished surface of the bottle, and the plate of glass, are to be wiped clean and dry; a drop of folution of gum arabic is to be put on the polished surface of the bottle, the top ftrongly and fteadily pressed upon it. fo as to bring the two furfaces into as close contact as possible; after which the bottle is to be placed in a cool airy place to dry. A piece of wet ox bladder. freed from fat, and foaked in water till it becomes mu-

Gg2

cilaginous.

Injection citaginous, is then to be placed over the top, the air Initiated, pressed out from between it and the glass; after which it must be tied with a pack-thread dipped in the solu-tion of gum arabic. The bladder being cut off neatly under the last turn of the thread, is then to be dried, the string taken cautiously off, and the top and neck painted with a composition of lamp-black mixed with japanners gold fize: this foon dries, and leaves a fine smooth gloffy furface, from which the dirt can at any time be as readily wiped off as from a mirror. By this method large bottles are as easily and effectually fecured as fmall ones; and it is found to answer as well as the hermetical fealing of glasses, which in large veffels is altogether impracticable. If the bottoms have any inequalities which prevent them from flanding fleady, they may be eafily made perfectly flat by grinding them with emery on the plate above mentioned. The tops, if well gummed, will even remain perfectly fixed on the glaffes without the bladder: though in the common upright ones it may be advisable to put it on as a defence. Our author informs us, that fince his making this difcovery, he has used glass faucers; with flat tops gummed on. In thefe veffels the preparations, by reason of their horizontal posture, appear to great advantage. Thus he has exhibited very early abortions in their membranes, and fome other preparations that cannot be suspended or viewed conveniently in the perpendicular direction. Some very delieate preparations, particularly those intended to be viewed with the microscope, those of the ampullulæ lactere of Liberkuhn, and of the valves of the abforbents, may be preferved either in spirits or dry in tubes closed in the manner just mentioned, and will appear to great advantage. Some of the dry ones may also be advantageously placed in fquare oblong boxes, made of pieces of plate or white glafs neatly gummed together, with narrow flips of white or coloured paper, and the objects may be conveniently viewed in this manner. With respect to the stopper bottles, which are very convenient for holding finall preparations, our author advifes the stoppers to be perfectly well ground; that they pass rather lower down than the neck of the bottle for the convenience of drilling two holes obliquely through the inferior edge of the substance of the stopper, opposite to each other, for the convenience of fixing threads to hold the fubject ; for if the threads pafs between the neck and flopper, a space will be left; or if the stopper be well ground, the neck of the bottle will be broken in endeavouring to press it down. On the other hand, if any fpace be left, the thread, by its capillary attraction, will act from capillary attraction, raise the spirits from the bottle, and caufe evaporation, which will likewife take place from the chink between the stopper and neck.

INISTIOGE, a post town of Kilkenny, in the province of Leinster; 63 miles from Dublin. It is alfo a borough, and returns two members to parliament; patronage in the reprefentative of Sir William

Fownes .- It has two fairs.

INITIATED, a term properly used in speaking of the religion of the ancient heathens; where it fignifies being admitted to the participation of the facred mysteries. The word comes from the Latin initiatus, of erificing, or to receive or admit a person to the begin- fimple water; because it doth not penetrate the paper

ning of the mysteries, or of ceremonies of less import- Injunction-

The ancients never difcovered the deeper mysteries of their religion, nor even permitted fome of their temples to be open, to any but those who had been ini-

tiated. See MYSTERY.

INJUNCTION, in law, a writ generally grounded upon an interlocutory order or decree out of the court of chancery or exchequer, fometimes to give possession to the plaintiff, for want of the defendant's appearance; fometimes to the king's ordinary court, and fometimes to the court-christian, to stop proceedings in a cause, upon fuggestion made, that the rigour of the law, if it take place, is against equity and conscience in that cafe, that the complainant is not able to make his defence in these courts, for want of witnesses, &c. or that they act erroneously, denying him fome just advantage. The writ of injunction is directed not only to the party himfelf, but to all and fingular his counfellors, attornies, and folicitors; and if any attorney, after having been ferved with an injunction, proceeds afterward contrary to it, the court of chancery will commit the attorney to the Fleet for contempt. But if an injunction be granted by the court of chanceryin a criminal matter, the court of king's bench may break it, and protect any that proceed in contempt of it.

INIURY, any wrong done to a man's perfon, re-

putation, or goods. See Assault. INK, a black liquor used in writing, generally

made of an infusion of galls, copperas, and gum-arabic. The properties which this liquor ought to have, are, 1. To flow freely from the pen, and fink a little into the paper, that the writing be not eafily difcharged. 2. A very deep black colour, which should be as deep at first as at any time afterwards. 2. Durability, for that the writing may not be fubject to decay by age. 4. Ink should be destitute of any corrosive quality, that it may not destroy the paper, or go through it. in fuch a manner as to render the writing illegible.. No kind of ink, however, hath yet appeared which is possessed of all these qualities. The ink used by the ancients was possessed of the fecond, third, and fourth qualities above mentioned, but wanted the first. Dr Lewis hath discovered its composition from some pasfages in ancient authors. " Pliny and Vitruvius (fays he) expressly mention the preparation of foot, or whatwe now call lamp-black, and the composition of writing-ink from lamp-black and gum. Diofcorides is more particular, fetting down the proportions of the two ingredients, viz. three ounces of the foot to one of the gum. It feems the mixture was formed into cakes or rolls; which being dried in the fun, were occasionally tempered with water, as the cakes of Indian ink are among us for painting."

In Mr Delaval's Treatife on Colours, p. 37. he acquaints us, that with an infusion of galls and iron filings, he had not only made an exceedingly black and durable ink, but by its means, without the addition of any acid, dyed filk and woollen cloth of a good and latting black. This kind of ink, however, though the colour is far fuperion to that of any other, bath the inconvenience of being very eafily discharged, eiinitiare, initiari; which properly fignifies to begin fa- ther by the smallest quantity of any acid, or even by

Ink.

in fuch a manner as is necessary to preserve it from the instantaneous action of the acid or of the water. During the action of the linding of galls upon the iron in making this kind of ink, a very considerable effervescence takes place, and a quantity of air is discharged, the nature of which hath not vet been examined.

The materials usually employed for the making of ink are, common green vitriol, or copperas and galls; but almost all of them are deficient in durability, which is a property of fuch importance, that Dr Lewis hath thought the fubiect of ink-making not unworthy of his attention. From experiments made by that author, he infers, that the decay of inks is chiefly owing to a deficiency of galls; that the galls are the most perishable ingredient, the quantity of these, which gives the greatest blackness at first (which is about equal parts with the vitriol), being infufficient to maintain the colour: that, for a durable ink, the quantity of galls cannot be much less than three times that of the vitriol; that it cannot be much greater without leffening the blackness of the ink: that by diminishing the quantity of water, the ink is rendered blacker and more durable; that diffilled water, rain-water, and hard fpring-water, have the same effects; that white-wine produces a deeper black colour than water; that the colour produced by vinegar is deeper than that by wine; that prooffpirit extracts only a reddish brown tinge; that the last-mentioned tincture finks into, and spreads upon, the paper; and hence the impropriety of adding fpirit of wine to ink, as is frequently directed, to prevent mouldiness or freezing: that other astringents, as oakbark, biftort, floe-bark, &c. are not fo effectual as galls, nor give fo good a black, the colour produced by most of these, excepting oak-bark, being greenish: that the juice of floes do not produce a black colour with martial vitriol; but that, nevertheless, the writing made with it becomes black, and is found to be more durable than common ink : that inks made with faturated folutions of iron in nitrous, marine, or acetous acids, in tartar, or in lemon-juice, were much inferior to the ink made with martial vitriol: that the colour of ink is depraved by adding quicklime, which is done with an intention of deltroying any superabundant acid which may be supposed to be the cause of the loss of the colour of ink : that the best method of preventing the effects of this fuperabundant acid is probably by adding pieces of iron to engage it; and that this conjecture is confirmed by an inftance the author had heard, of the great durability of the colour of an ink in which pieces of iron had been long immerfed: and laftly, that a decoction of logwood used instead of water, sensibly improves both the beauty and deepness of the black, without disposing it to fade. The fame author observes, that the addition of gum-arabic is not only ufeful, by keeping the colouring matter suspended in the fluid, but also by preventing the ink from fpreading, by which means a greater quantity of it is collected on each stroke of the pen-Sugar, which is fometimes added to ink, is found to be much less effectual than gums, and to have the inconvenience of preventing the drying of the ink. The colour of ink is found to be greatly injured by keeping the ink in vessels made of copper or of lead, and probably of any other metal, excepting iron, which the vitriolic acid can diffolve.

The foregoing experiments point out for the best proportions of the ingredients for ink, One part of green vitriol, one part of powdered logwood, and three parts of powdered galls. The best menftruum appears to be vinegar or white-wine, though for common use water is sufficient. If the ink be required to be of a full colour, a quart, or at most three pints, of liquor, may be allowed to three ounces of galls, and to one ounce of each of the other two ingredients. Half an ounce of gum may be added to each pint of the liquor. The ingredients may be all put together at once in a convenient veffel, and well thaken four or five times each day. In 10 or 12 days the ink will be fit for use, though it will improve by remaining longer on the ingredients. Or it may be made more expeditiously, by adding the gum and vitriol to a decoction of galls and logwood in the menstruum. To the ink, after it has been separated from the feculencies, fome coarse powder of galls, from which the fine dust has been fifted, together with one or two pieces of iron, may be added, by which its durability will be fecured.

In some attempts made by the Doctor to endow writing ink with the great durability of that of the ancients, as well as the properties which it has at prefent, he first thought of using animal glues, and then of oily matters. "I mixed both lamp-black (fays he) and ivory-black with folution of gum arabic, made of such consistence as just to flow sufficiently from the pen. The liquors wrote of a sine black colour; but when dry, part of the colour could be rubbed off, especially in most weather, and a pencil dipped in wa-

ter washed it away entirely.

"I tried folutions of the animal-glues with the fame event. If finglate or fift-glue being the most difficulty diffoluble of these kinds of bodies, I made a decoction of it in water, of fuch strength that the liquor concreted into a jelly before it was quite cold; with this jelly, kept fluid by fufficient heat, I mixed fone ivory-black; characters drawn with this mixture on paper bore rubbing much better than the others, but were discharged without much difficulty

by a wet pencil. " It was now fuspected, that the colour could not be fufficiently fixed on paper without an oily cement. As oils themselves are made miscible with watery sluids by the intervention of gum, I mixed fome of the fofter painters varnish, after mentioned, with about half its weight of a thick mucilage of gum arabic, working them well together in a mortar till they united into a fmooth uniform mass: this was beaten with lampblack, and fome water added by little and little, the rubbing being continued till the mixture was diluted to a due confiltence for writing. It wrote freely, and of a full brownish-black colour: the characters could not be discharged by rubbing, but water washed them. out, though not near fo readily as any of the foregoing. Instead of the painters varnish or boiled oil, I mixed raw linfeed oil in the fame manner with mucilage and lamp-black; and on diluting the mixture with water, obtained an ink not greatly different from the other.

"Though these only mixtures answered better than those with simple gums or glues, it was apprehended that their being dischargeable by water would render them unfit for the purposes intended. The only way

01

of obviating this imperfection appeared to be, by means of giving it the due blackness. By this admixwithou a paper which should admit the black liquid to ture it may be prefumed also that the vitriolic ink will fink a little into its fubstance. Accordingly I took fome of the more finking kinds of paper, and common paper made damp as for printing; and had the fatiffaction to find, that neither the oily nor the fimple gummy mixtures spread upon them fo much as might have been expected, and that the characters were as fixed as could be defired, for they could not be washed out without rubbing off part of the fubftance of the

paper itself. " All these inks must be now and then stirred or shaken during the time of use, to mix up the black powder, which fettles by degrees to the bottom : those with oil must be well shaken also, though not used, once a-day, or at least once in three or four days, to keep the oil united with the water and gum; for if once the oil feparates, which it is apt to do by ftanding at rest for some days, it can no longer be mixed with the thin fluid by any agitation. But though this imperfect union of the ingredients renders these inks less fit for general use than those commonly employed, I apprehend there are many occasions in which these kinds of inconveniences will not be thought to counterbalance the advantage of having writings which we may be affured will be as lafting as the paper they are written upon. And indeed the inconvenience may be in a great measure obviated by using cotton in the inkfland, which, imbibing the fluid, prevents the fepara-

tion of the black powder diffused through it.

" All the inks, however, made on the principle we are now speaking of, can be discharged by washing, unless the paper admits them to fink into its subflance. The ancients were not infenfible of this imperfection; and sometimes endeavoured to obviate it, according to Pliny, by using vinegar, instead of water, for tempering the mixture of lamp-black and gum. I tried vinegar, and found it to be of fome advantage, not as giving any improvement to the cement, but by promoting the finking of the matter into the paper. As this washing out of the ink may be prevented by using a kind of paper easy enough to be procured, it is scarcely to be considered as an imperfection; and indeed, on other kinds of paper, it is an imperfection only fo far as it may give occasion to fraud, for none of these inks are in danger of being otherwife discharged than by defign. The vitriolic inks themselves, and those of printed books and copperplates, are all dischargeable; nor can it be expected of the ink-maker to render writings fecure from frauds.

"But a further improvement may yet be made, namely, that of uniting the ancient and modern inks together; or using the common vitriolic ink instead of water, for tempering the ancient mixture of gum and lamp-black. By this method it should seem that the writings would have all the durability of those of former times, with all the advantage that refults from the vitriolic ink fixing itself in the paper. Even where the common vitriolic mixture is depended on for the ink, it may in many cases be improved by a small addition of the ancient composition, or of the common Indian ink which answers the same purpose: when the vitriolic ink is dilute, and flows fo pale from the pen, that the fine strokes, on first writing, are scarcely vifible, the addition of a little Indian ink is the readiest

be made more durable, the Indian ink in fome meafure covering it, and defending it from the action of the air. In all cases, where Indian ink or other similar compositions are employed, cotton should be used in the inkfland, as already mentioned, to prevent the fettling of the black powder."

Since the invention of printing much less attention than formerly has been paid to the making of ink, fo that now the art feems to be in a great measure lost. This will appear from a comparison of some ancient manuscripts with the writings of modern times. It being of the utmost importance, however, that public records, wills, and other valuable papers, which cannot admit of being printed, should be written with ink of a durable quality, this inattention feems to have been very culpable, and a reftoration of the method of making writing ink a very valuable acquifition. "The neceffity (fays Mr Aftle *) of paying greater attention to . Origin of this matter may readily be feen, by comparing the rolls Alphale and records that have been written from the 15th Writing. century to the end of the 17th, with the writings we

have remaining of various writings from the 5th to the 12th centuries. Notwithstanding the Superior antiquity of the latter, they are in excellent prefervation; but we frequently find the former, though of more modern date, so much defaced that they are fcarcely legible."

Our author agrees with Dr Lewis in the opinion that the ancient inks were composed of foot or ivory black inflead of the galls, copperas, and gums, which form the composition of ours. Besides their black inks, however, the ancients used various other colours, as red, gold and filver, purple, &c. Green ink was frequently used in Latin manusoripts, especially in the latter ages; and it was frequently employed in fignatures by the guardians of the Greek emperors till their wards were of age. Blue or yellow ink was feldom used except in manuscripts; but (fays Mr Aftle) "the yellow has not been much in use, as far as we can learn, these 600 years." Some kinds of characters, particularly the metallic, were burnished. was used by the Latins and Greeks as a varnish, but especially by the former, and particularly in the 9th century. It continued a long time in vogue.

A treatife upon inks was published by Peter Caniparius professor of medicine at Venice; of which an edition was printed at London in 1660. It is divided into fix parts. The first treats of inks made from pyrites, flones, and metals; the fecond of fuch as are made from metals and calces; the third from foots and vitriols; the fourth of the different kinds of inks used by the librarii or book-writers, by printers, and engravers; likewise of staining or writing upon marble, stucco, or fealiolia, and of encaustic modes of writing; also of liquids for painting or colouring leather and linen or woollen cloths; reftoring inks that had been decayed by time; together with many methods of effacing writing, reftoring decayed paper, and different modes of fecret writing. The fifth treats of writing inks made in different countries from gums, woods, the juices of plants, &c. as well as of different kinds of varnishes. The fixth treats of the different methods of extracting vitriol, and the chemical uses of it.

Weckerus

1612, contains a number of curious particulars concerning ink. He gives also receipts for making gold and filver inks, composed both with these metals and without them; directions for making inks for fecret writing, and for defacing them; though in this laft part there are many particulars bordering too much on the marvellous.

In the Philosophical Transactions for 1787, Dr Blagden gives some account of a method of restoring deeayed inks fo as to render them legible. His experiments originated from a conversation with Mr Aftle already quoted, on the question whether the inks made eight or ten centuries ago, and which are found to have preferved their colour very well, were made of the fame materials now employed or not? In order to decide the question, Mr Astle furnished the Doctor with feveral manuscripts on parchment and vellum from the oth to the 15th centuries inclusively. Some of these were still very black; others of different shades, from a deep yellowish brown to a very pale yellow, in fome parts fo faint that it could fearbely be feen. This was tried with Imple and phlogisticated alkalies, the mineral acids, and infusion of galls. From these experiments it appeared that the ink anciently employed was of the fame nature as at prefent : the letters turned of a reddish or yellowish brown with alkalies became pale, and were at length obliterated by the dilute mineral acids. The drop of acid liquor, which had been put upon a letter, changed to a deep blue or green on the addition of phlogisticated alkali; with an infusion of galls, in some cases the letters acquired a deep tinge, in others a flight one. " Hence (fays the Doctor) it is evident, that one of the ingredients was iron, which there is no reason to doubt was joined with the vitriolic acid; and the colour of the more perfect MSS, which in fome was a deep black, and in others a purplish black, together with the restitution of that colour in those which had lost it by the infusion of galls, fufficiently proved that another of the ingredients was aftringent matter, which from history appears to have been that of galls. No trace of a black pigment of any fort was discovered; the drop of acid, which had completely extracted a letter, appearing of an uniform pale and ferruginous colour, without an atom of black powder, or other extraneous matter floating in 21."

As this account differs very materially from the former extracted from Mr Aftle's writings, fo the reason given for the continuance of the colour differs no lefs. This, according to Dr Blagden, "feems to depend very much on a better preparation of the material upon which the writing was made, namely the parchment or vellum; the blackest letters being generally those which had funk into it the deepest. Some degree of effervescence was commonly to be perceived when acids were in contact with the furface of these old vellums. I was led, however, to fuspect, that the ancient inks contained rather a less proportion of iron than the more modern; for, in general, the tinge of colour produced by the phlogificated alkali in the acid laid upon them, feemed less deep; which, however, might depend in part upon the length of time they had been kept : and perhaps more gum was used in them, or ever it touches. Care ought, however, to be taken

Weekerus de Secretis, a treatise printed at Basil in they were washed over with some kind of varnish, tho' not fuch as gave any glofs."

Among the specimens with which our author was favoured by Mr Aftle, there was one which differed very materially from the reft. It was faid to be a manufcript of the 15th century: the letters were of a full engroffing hand, angular without any fine strokes, broad, and very black. None of the chemical folvents above mentioned feemed to produce any effect. Most of them feemed rather to make the letters blacker, probably by cleaning the furface; and the acids, after having been rubbed strongly upon the letters, did not firike any deeper tinge with the phlogifticated alkali. Nothing could obliterate these but what took off part of the vellum; when small rolls of a dirty matter were to be perceived. " It is therefore unquestionable (fays, the Doctor) that no iron was used in this ink; and, from its refiftance to the chemical folvents, as well as a certain clotted appearance in the letters when examined closely, and in fome places a flight degree of gloss, I have little doubt that they were formed of a footy or carbonaceous powder and oil, probably fomething like ourprefent printer's ink; and am not without suspicion that they were actually printed."

On examining this MS, more fully, our author was convinced that it was really a part of a very ancient printed book. In confidering the methods of restoring the legibility of decayed writings, our author observes, that perhaps one of the best may be to join phlogisticated alkali with the calx of iron which remains; because the precipitate formed by these two substances greatly exceeds that of the iron alone. On this subject Dr Blagden difagrees with Mr Bergmann; but to bring the matter to a test, the following experiments were

made. 1. The phlogisticated alkali was rubbed in different quantities upon the bare writing. This, in general, produced little effect; though, in a few instances, it gave a bluish tinge to the letters, and increased their intenfity; " probably (fays the Doctor) where fomething of an acid nature had contributed to the diminution of their colour." 2. By adding, befides the alkali, a dilute mineral acid to the writing, our author found his expectations fully answered; the letters then changing quickly to a very deep and beautiful blue. It is but of little confequence whether the acid or phlogifticated alkali be first added; though upon farther confideration the Doctor inclined to begin with the alkali. The reason is, that when the alkali is first put on, the colour feems to spread less, and thus not to hurt the legibility of the writing fo much as would otherwise be done. His method is to spread the alkali thin over the writing with a feather, then to touch it as gently as possible upon or nearly over the letters with the diluted acid by means of a feather or bit of flick cut to a blunt point. The moment that the acid liquor is applied, the letters turn to a fine blue, beyond comparison stronger than the original trace of the letter; and by applying a bit of blotting-paper to fack up the superfluous liquid, we may in a great meafure avoid the staining of the parchment; for it is this. fuperfluous liquor which, abforbing part of the colouring matter from the letters, becomes a dye to whatnot to allow the blotting paper to come in contact, with the letters, because the colouring matter may earlie the rubbed off while foft and wet. Any one of the three mineral acids will answer the purpose effectually:

Dr Blagden commonly uses the marine. But which ever of the three is used, it ought to be diluted for as not to be in danger of corroding the parbment; after which the degree of strength seems not to be a matter of great nicety.

Another method of refloring the legibility of old writings is by wetting them with an infulino of galls in white wine: but this is fubject to the fame inconvenience with the former, and is befides lefs efficacious. The Doctor is of opinion that the acid of the galls by iteff would be better for the purpose than the infulion of the whole fubliance of them; and he thinks also that a preferable kind of phlogisticated alkali might be prepared either by purifying the common kind from iron as much as possible, or by making use of the volatile alkali instead of the fixed. Mr Aftle mentions a method of refloring the legibility of decayed writings; but says that it ought not to be hazarded left a surpicion of deceit should arise.

In the Monthly Review of this volume of the Tranfactions, we find a method propofed of preventing ink from decaying, which feems very likely to answer the purpose. It consists in washing over the paper to be written upon with the colouring matter of Prussian blue, which will not deprave it in colour, or any other respect. By writing upon it with common ink afterwards, a ground of Prussian blue is formed under every stroke; and this remains strong after the black has been decayed by the weather, or destroyed by acids. Thus the ink will bear a larger proportion of virtiol at first, and will have the advantage of looking blacker when first written.

Indian INK, a valuable black for water-colours, brought from China and other parts of the East Indies, fometimes in large rolls, but more commonly in fmall quadrangular cakes, and generally marked with Chinese characters. Dr Lewis, from experiments made on this fubstance, hath shown that it is composed of fine lamp-black and animal-glue; and accordingly, for the preparation of it, he defires us to mix the lampblack with as much melted glue as is fufficient to give it a tenacity proper for being made into cakes; and thefe when dry, he tells us, answered as well as those imported from the East Indies, both with regard to the colour and the freedom of working. Ivory-black, and other charcoal blacks, levigated to a great degree of finenefs, answered as well as the lamp black; but in the state in which ivory-black is commonly fold, it proved much too gritty, and feparated too haftily from the water.

Printing Inx, is totally different from Indian ink, or that made use of in writing. It is an oily composition, of the confidence of an ointenent: the method of preparing it was long kept a secret by those whose employment it was to make it, and who were interested in conceasing it; and even yet is but imperfectly known. The properties of good printing ink No 186.

types, or tearing the paper; to have a fine black colour; to wash easily off the types; to dry soon; and to preferve its colour, without turning brown. This last, which is a most necessary property, is effectually obtained by fetting fire to the oil with which the printing ink is made for a few moments, and then extinguishing it by covering the vessel (A). It is made to wash easily off the types, by using soap as an ingredient; and its working clean depends on its having a proper degree of strength, which is given by a certain addition of rolin. A good deal, however, depends on the proportion of the ingredients to each other; for if too much foap is added, the ink will work very foul, and daub the types to a great degree. The fame thing will happen from using too much black, at the same time that both the foap and black hinder the ink from drying; while too much oil and rofin tear the paper. and hinder it from washing off .- The following receipt has been found to make printing ink of a tolerable good quality. " Take a Scots pint of linfeed oil. and fet it over a pretty brisk fire in an iron or copper veffel capable of holding three or four times as much. When it boils strongly, and emits a thick smoke, kindle it with a piece of paper, and immediately take the veffel off the fire. Let the oil burn for about a minute ; then extinguish it by covering the vessel; after it has grown pretty cool, add two pounds of black rofin, and one pound of hard foap cut into thin flices. If the oil is very hot when the foap is added, almost the whole mixture will run over the veffel. The mixture is then to be fet again over the fire; and when the ingredients are thoroughly melted, a pound of lampblack, previously put through a lawn fieve, is to be stirred into it. The whole ought then to be ground on a marble stone, or in a mill like the levigating mill Though the article Chemistry, n° 599."

Though the above receipt is greatly superior to any that hath been hitherto published, all of which

Though the above receipt is greatly fuperior to any that hath been hitherto published, all of which are capitally deficient in not mentioning the necefary ingredients of rolin and foap; yet it must be acknowledged, that nik made in this manner is inferior in point of colour, and is likewife more apt to daub the types and make an inditinct imprefilion, than fuch as is prepared by fome of those who make the manufacture of this commodity their employment; so that either a variation in the proportion of the ingredients, a nicety in the mixture, or fome additional inspredient, seems necessary to bring it to the requisite

Ink for the Rolling Preft, is made of lintifeed oil burnt in the fame manner as that for common printingink, and then mixed with Francfort-black, and finely ground. There are no certain proportions which can be determined in this kind of ink; every workman adding oil or black to his ink as he thinks proper, in order to make it fuit his own talke.—Some, however, mix a portion of common boiled oil, which has never been burnt: but this must necessarily be a bad practice, as such oil is apt to go through the paper; a fault very common in prints, especially if the paper a fault very common in prints, especially if the paper.

⁽A) This is mentioned by Dr Lewis in his Philosophical Commerce of Arts; but he seems not to have been acquainted with the method of giving it the other necessary properties.

ink is not cleared off from the copperplates with alkaline ley as in common printing, but with a brush dipped in oil.

INK is also an appellation given to any coloured liquor used in writing, whether red, yellow, green, &c. Many different kinds of these inks may be prepared by the directions given under the article Co-LOUR Making, which it would be fuperfluous here to

Sympathetic INK, a liquor with which a person may write, and yet nothing appear on the paper after it is dry, till fome other means are used, such as holding the paper to the fire, rubbing it over with fome other

liquor, &c.

These kinds of ink may be divided into seven classes. and that with respect to the means used to make them visible; viz. 1. Such as become visible by passing another liquor over them, or by exposing them to the vapour of that liquor. 2. Those that do not appear so long as they are kept close, but foon become visible on being exposed to the air. 3. Such as appear by frewing or fifting fome very fine powder of any colour over them. 4. Those which become visible by being expofed to the fire. 5. Such as become visible by heat, but disappear again by cold or the moisture of the air. 6. Those which become visible by being wetted with water. 7. Such as appear of various colours, red.

yellow, blue, &c.

I. The first class contains four kinds of ink, viz. folutions of lead, bifmuth, gold, and green vitriol. The first two become visible in the same manner, viz. by the contact of fulphureous liquids or fumes. For the first, a folution of common fugar-of-lead in water will answer as well as more troublesome preparations. If you write with this folution with a clean pen, the writing when dry will be totally invitible: but if it be wetted with a folution of bepar fulphuris, or of orpiment, dissolved by means of quick-lime; or if it be exposed to the strong vapours of these folutions, but especially to the vapour of volatile tincture of fulphur; the writing will appear of a brown colour, more or less deep according to the strength of the sulphureous fume. By the fame means, what is wrote with the folution of bifmuth in spirit of nitre will appear of a deep black.

The sympathetic ink prepared from gold depends on the property by which that metal precipitates from its folvent on the addition of a folution of tin. If you write with a folution of gold in aqua regia, and let the paper dry gently in the shade, nothing will appear for the first feven or eight hours. Dip a pencil or a finall fine fponge in the folution of tin, and drawing it lightly over the invisible characters, they will imme-

diately appear, of a purple colour.

Characters wrote with a folution of green vitriol carefully depurated, will like wife be invisible when the paper is dry; but if wetted with an infusion of galls, they will immediately appear as if wrote with common ink. If, inflead of this infusion, a folution of the phlogisticated alkali, impregnated with the colouring matter Prussian blue is made up of, the writing will appear of a very deep blue.

II. To the fecond class belong the folutions of all those metals which are apt to attract phlogiston from

VOL. IX. Part I.

is not very thick. No foap is added; because the the air, such as lead, bismuth, silver, &c. The sympathetic ink of gold already mentioned belongs also to this class; for if the characters wrote with it are long exposed to the air, they become by degrees of a deep violet colour, nearly approaching to black. In like manner, characters wrote with a folution of filver in aquafortis are invisible when newly dried, but being exposed to the fun, appear of a grey colour like flate. To this class also belong folutions of lead in vinegar; copper in aquafortis; tin in aqua regia; emery, and fome kinds of pyrites, in spirit of falt; mercury in aquafortis; or iron, in vinegar. Each of these has a particular colour when exposed to the air ; bur they have the difagreeable property of corroding the paper. fo that after fome time the characters appear like holes cut out of the paper.

III. The third class of fympathetic inks contains fuch liquids as have fome kind of glutinous vifcofity, and at the same time are long a drying; by which means, though the eye cannot difcern the characters wrote with them upon paper, the powders strewed npon them immediately adhere, and thus make the writing become visible. Of this kind are urine, milk, the juices of fome vegetables, weak folutions of the de-

liquescent falts, &c.

IV. This class, comprehending all those that become visible by being exposed to the fire, is very extensive, as it contains all those colourless liquids in which the matter diffolved is capable of being reduced. or of reducing the paper, into a fort of charcoal by a fmall heat. A very eafily procured ink of this kind is oil of vitriol diluted with as much water as will prevent it from corroding the paper. Letters wrote with this fluid are perfectly invisible when dry, but instantly appear as black as if wrote with the finest ink on being held near the fire. Juice of lemons or onions, a folution of fal-ammoniac, green vitriol, &c. will anfwer the same purpose, though not so easily, or with fo little heat.

V. The fifth class comprehends only folutions of regulus of cobalt in spirit of falt; for the properties of

which, fee CHEMISTRY, nº 822.

VI. This class comprehends such inks as become visible when characters wrote with them are wetted with water. They are made of all fuch fubitances as deposit a copious sediment when mixed with water, diffolving only imperfectly in that fluid. Of this kind are dried alum, fugar of lead, vitriol, &c. We have therefore only to write with a ftrong folution of these falts upon paper, and the characters will be invisible when dry; but when we apply water, the fmall portion of dried falt cannot again be diffolved in the water. Hence the infoluble part becomes visible on the paper, and shows the characters wrote in white. grey, brown, or any other colour which the precipitate affumes.

VII. Characters may be made to appear of a fine crimfon, purple, or yellow, by writing on paper with folution of tin in aqua regia, and then paffing over it a pencil dipt in a decoction of cochineal, Brazil-wood, logwood, yellow wood, &c .- For an account of the nature of all these sympathetic inks, however, and the principles on which they are made, fee the articles CHEMISTRY and COLOUR-Making, passim.

INK-Stones, a kind of small round itones of a white,

red, grey, yellow, or black, colour, containing a quantity of native martial vitriol, whence they derive the property of making ink, and from thence their name. They are almost entirely soluble in water, and besides their other ingredients, contain also a portion of copper and zinc

IRIS-STONE. See Moon-Stone.

INLAND, a name for any part of a country at a distance from the sea.

INLAND Navigation. See CANAL and (Inland) NA-

INLAND Trade, that kind of trade carried on between the different parts of the fame kingdom, whether over land, or by means of inland navigation.

INLAYING. SceVeneering, Mosaic, and Mar-

INLEASED, in our old writers, fignifies entangled or enfnared. It is used in the champion's oath.

INLISTING, in a military fense. See LISTING. INMATES, fuch perfons as are admitted for their money, to live in the same house or cottage with another man, in different rooms, but going in at the fame door; being usually supposed to be poor, and not able to maintain a whole house themselves. These are inquirable in a court-leet .- No owner or occupier of a cottage shall suffer any inmates therein, or more families than one to inhabit there, on pain of forfeiting 10s. per month to the lord of the lect.

INN, a place appointed for the entertainment and

relief of travellers.

Inns are licensed and regulated by justices of the peace, who oblige the landlord to enter into recognizances for keeping good order. If a person who keeps a common inn, refuses to/receive a traveller into his house as a guest, or to find him victuals and lodging on his tendering a reasonable price for them, he is liable to an action of damages, and may be indicted and fined at the king's fuit. The rates of all commodities fold by inn-keepers, according to our ancient laws, may be affeffed : and inn-keepers not felling their hay, oats, beans, &c. and all manner of victuals at reasonable prices, without taking any thing for litter, may be fined and imprisoned, &c. by 21 Jac. I. c. 21. Where an inn-keeper harbours thieves, persons of infamous character, or fuffers any diforders in his house, or fets up a new inn where there is no need of one, to the hindrance of ancient and well governed inns, he is indictable and fineable: and by ftatute, fuch inn may be suppressed. Action upon the case lies against any inn-keeper, if a theft be committed on his guest by a fervant of the inn, or any other person not belonging to the gueft; though it is otherwise where the guest is not a traveller, but one of the same town or village, for there the inn-keeper is not chargeable; nor is the master of a private tavern answerable for a robbery committed on his guest: it is faid, that even tho' the travelling guest does not deliver his goods, &c. into the inn-keeper's possession, yet if they are stolen, he is chargeable. An inn-keeper is not answerable for any thing out of his inn, but only for fuch as are within it; yet, where he of his own accord puts the gueft's horse to grass, and the horse is stolen, he is answerable, he not having the guest's orders for putting such horse to grass. The inn-keeper may justify

the stopping of the horse, or other thing of his guest, for his reckoning, and may retain the same till it be paid. Where a person brings his horse to an inn, and leaves him in the stable, the inn-keeper may detain him till fuch time as the owner pays for his keeping : and if the horse eats out as much as he is worth, after a reasonable appraisement made, he may sell the horse and pay himself: but when a guest brings several horfes to an inn, and afterwards takes them all away except one, this horfe fo left may not be fold for payment of the debt for the others; for every horse is to be fold, only to make fatisfaction for what is due for his own meat.

INNS. Our colleges of municipal or common law professors and students, are called inus: the old English word for houses of noblemen, bishops, and others of extraordinary note, being of the fame fignification

with the French word botel

INNS of Court are fo called, as fome think, because the fludents there are to ferve and attend the courts of judicature; or elfe, because anciently these colleges received none but the fons of noblemen, and better fort of gentlemen, who were here to be qualified to ferve the king in his court; as Fortescue affirms. And, in his time, he favs, there were about 2000 students in the inns of court and chancery, all of whom were filii nobilium, or gentlemen born. But this custom has gradually fallen into difuse; so that in the reign of queen Elizabeth, Sir Edward Coke does not reckon above 1000 students, and the number at prefent is very confiderably less; for which judge Blackstone assigns the following reasons. 1. Because the inns of chancery, being now almost totally filled by the inferior branches of the profession, are neither commodious nor proper for the refort of gentlemen of any rank or figure; fo that there are very rarely any young students entered at the inns of chancery. 2. Because in the inns of court all forts of regimen and academical fuperintendence, either with regard to morals or fludies, are found impracticable, and therefore entirely neglected. Laftly, because persons of birth and fortune, after having finished their usual courses at the universities, have feldom leifure or resolution sufficient to enter upon a new scheme of study at a new place of instruction; wherefore few gentlemen now refort to the inns of court, but fuch for whom the knowledge of practice is absolutely necessary in such as are intended for the pro-

Our inns of court, justly famed for the production of men of learning in the law, are governed by mafters, principals, benchers, ftewards, and other officers; and have public halls for exercises, readings, &c. which the fludents are obliged to attend and perform for a certain number of years, before they can be admitted to plead at the bar. These societies have not, however, any judicial authority over their members : but inflead of this they have certain orders among themselves, which have by consent the force of laws. For lighter offences perfons are only excommoned, or put out of commons; for greater, they lofe their chambers, and are expelled the college; and when once expelled out of one fociety, they are never received by any of the others. The gentlemen in these socities may be divided into benchers, utter-barrifters,

inner-barrifters, and students.

Blackft.

The four principal inns of court, are the Inner Temple and Middle Temple, heretofore the dwelling Innisfallen, of the Knights Templars, purchased by some profesfors of the common law about 300 years ago; Lincoln's Inn, and Gray's Inn, anciently belonging to the

earls of Lincoln and Gray. The other inns are the two INNS of Chancery were probably fo called, because anciently inhabited by fuch clerks as chiefly studied the forming of writs, which regularly belonged to the

curfitors, who are officers of chancery.

The first of these is Thavies Inn, begun in the reign of Edward III. and fince purchased by the fociety of Lincoln's Inn. Beside this, we have New Inn, Symond's Inn, Clement's Inn, Clifford's Inn, anciently the house of the Lord Clifford; Staple Inn, belonging to the merchants of the staple : Lion's Inn, anciently a common inn with the fign of the lion; Furnival's Inn, and Bernard's Inn.

Thefe were heretofore preparatory colleges for younger students; and many were entered here, before they were admitted into the inns of court. Now they are mostly taken up by attornies, folicitors, &c.

They all belong to fome of the inns of court, who formerly used to fend yearly fome of their barristers to

read to them.

INNATE IDEAS, those supposed to be stamped on the mind, from the first moment of its existence, and which it constantly brings into the world with it: a doctrine which Mr Locke has taken great pains to re-

INNERKEITHING. See INVERKEITHING. INNERLOCHY. See INVERLOCHY and FORT-

WILLIAM.

See INCH.

INNISCLOCHRAN, or the STONEY ISLAND, an ifland in Lough Ree, in the river Shannon, between the counties of Westmeath and Roscommon, at which place a monastery was founded by St Dermod, about the beginning of the 6th century.

INNISFAIL (derived from Inis Bheal, that is, "the island of Bheal"), one of the ancient names of Ireland, fo denominated from Beal, the principal object of adoration among the ancient inhabitants of the British isles. Innisfail has been errencously translated the Island of Desliny, as Bheal was fometimes taken for

INNISFALLEN, an ifland in the lake of Killarney, in the county of Kerry and province of Munster: in it are the ruins of a very ancient religious house, founded by St Finian, the patron faint of thefe parts, and to him the cathedral of Aghadoe is also dedicated. The remains of this abbey are very extensive, its situation romantic and retired. Upon the diffolution of religious houses, the possessions of this abbey were granted to Captain Robert Collam. The island contains about 12 acres, is agreeably wooded, and has a number of fruit trees. St Finian flourished about the middle of the 6th century; he was firnamed in Irish Lobbar, his father's name was Conail the fon of Eschod: defcended from Kian the fon of Alild, king of Munfter. There was formerly a chronicle kept in this abbey, which is frequently cited by Sir J. Ware and wars of Ireland at the revolution, out of which a re-

from the creation of the world to the year 430 or Innifhanthereabouts, but from thence the annalist has amply enough profecuted the affairs of Ireland down to his Innificial own times. He lived to the year 1215. Sir J. Ware had a copy of them, whereof there is an imperfect transcript among the MSS. of the library of Trinity-College, Dublin. They were continued by another hand to the year 1320. Bishop Nicholson, in his Irish historical library, informs us, that the duke of Chandos had a complete copy of them down to 1320 in his poffession. These annals tell us, that in the year 1180. the abbey, which had at that time all the gold and filver and richeft goods of the whole country deposited in it, as the place of greatest fecurity, was plundered by Mildwin fon of Daniel O'Donoghoe, as was alfo the church of Ardfert, and many persons were slain in the very cemetery by the M'Cartys; but God, as it is faid in this chronicle, punished this impiety by the untimely end of fome of the authors of it.

INNISHANNON, a town in the county of Cork and province of Muniter, 134 miles from Dublin; fituated on the river Bandon, fix miles from Kinfale. Here is a charter fchool for above 30 boys. The linen manufacture has been much encouraged by the late Mr Adderly. The river is navigable to Collier's quay, about half a mile below the place. On the west fide of the town is a stone bridge. This place was formerly walled, and of fome note, as appears by the foundations of feveral caftles and large buildings difcovered in it. The town of Innishannon, together with its ferry, were granted to Philip de Barry by Hen. V. by letters patent, anno 1412. It has two fairs.

INNISHIRKAN, an island situated between Cape Clear Island and Baltimore Bay, in the county of Cork and province of Munster. In this island stood the castle of Dunelong, possessed by the O'Drifcolls, which was furrendered after the defeat of the Spaniards to Captain Hervey on 23d Feb. 1602. There was afterwards a regular fortification erected on part of the island, which was garrifoned in Queen Ann's times but it has been for feveral years difmantled; about a mile to the fouth are the remains of an ancient abbey, founded 1460, for Franciscans, by Florence O'Drifcoll. This island has very good land, and is vastly preferable to that of Cape Clear islands. To the northwest of Innishirkan island lies Hare island, a large fruitful fpot; and near it are four fmall islands called the Schemes: also along the coast, in the following order from east to west, are Horse island, containing 100 acres; Castle island, containing 119 acres; Long island, containing 316 acres; and west of all these is a small fpot called Goat island. All these islands, together with the adjacent coaft, produce large crops of fine

INNISKILLING, a borough, market, fair, and post town of Ireland, in the county of Fermanach and province of Uliter, lying between three lakes. It is about 24 miles east of Ballyshannon, and 79 north-weit of Dublin. It fends two members to parliament ; patrou Lord Inniskilling, this place giving title of viscount to the family of Cole. Its inhabitants dittinguished themselves in feveral considerable engagements in the other antiquaries under the title of the Annals of Ingiment of dragoons, bearing the title of the Innificial nisfallen. They contain a sketch of universal history, ners, was mostly formed. They form the 6th regi-

rack for three companies of foot.

INNOCENT's DAY, a feltival of the Christian church, observed on December 28th, in memory of the massacre of the innocent children by the command of Herod king of Judeas. See Jesus Chrijf; and Jews, n° 24, par. ult. The Greek church in their kalendar, and the Abhsthians of Ethiopia in their offices, com-

memorate 14,000 infants on this occasion. INNUENDO (of immo "I nod or beckon"), is a word frequently used in writs, declarations, and pleadings, to ascertain a person or thing which was named, but left doubtful, before: as, he (immendo the plaintist) did so and so; mention being before made of another person.—In common conversation or writing, an innuendo denotes an oblique hint or distant reference, in contraditionation to a direct and positive charge.

INO (fab. hift.), a daughter of Cadmus and Harmonia, who nurfed Bacchus. She married Athamas king of Thebes, after he had divorced Nephele, by whom he had two children Phryxus and Helle, Ino became mother of Melicerta and Learchus; and foon conceived an implacable hatred against the children of Nephele, because they were to ascend the throne in preference to her own. Phryxus and Helle were informed of Ino's machinations, and they escaped to Colchis on a golden ram. Juno, zealous of Ino's prof-perity, refolved to diffurb her peace; and more particularly because she was of the descendants of her greatest enemy, Venus. Tifiphone was fent by order of Juno to the house of Athamas; and she filled the whole palace with fuch fury, that Athamas taking Ino to be a lioness and her children whelps, purfued her and dashed her fon Learchus against a wall. Ino escaped from the fury of her husband; and from a high rock she threw herfelf into the fea with Melicerta in her arms. The gods pitied her fate; and Neptune made her a fea deity, which was afterwards called Leucothoe. Melicerta became also a sea god, known by the name of Palemon.

INOA, feltivals in memory of Ino, celebrated yearly with fports and facrifices at Corinth. An anniverfary facrifice was also offered to Ino at Megara, where she was first worthipped under the name of Leucothoe. —Another in Laconia, in honour of the same. It was usual at the celebration to throw cakes of flour into a pond, which if they funk were prelages of profperity, but if they swam on the surface of the waters they were inausspicious and very unlucky.

ÍNOCA RPÚS, in botany : A genus of the monogynia order, belonging to the decandria class of plants. The corolla is funnel-shaped; the calyx bind; the stamina are placed in a double series; the fruit is a monospermous plum.

INÔCULATION, or suppise, in gardening, is commonly practified upon all forts of flone fruit; as nectarines, peaches, apricots, plums, cherries, as alfoupon oranges and jafmines: and indeed this is preferable to any fort of grafting for most forts of fruit. The method of performing it is as follows: You must be provided with a flarap pen.knife with a flat haft, which is to valid the bark of the flock to admit the bud; and fome found balf-smart, which flould be foaked in water, to increase its firength, and render it more pliable: then having taken off the cuttings from the

trees you would propagate, you must choose a smooth Inoculapart of the stock, about five or fix inches above the furface of the ground, if defigned for dwarfs; but if for ftandards, they should be budded fix feet aboveground. Then with your knife make an horizontal cut across the rind of the stock, and from the middle of that cut make a flit downwards, two inches in length, that it may be in the form of a T; but you must be careful not to cut too deep, lest you wound the flock : then having cut off the leaf from the bud. leaving the foot-stalk remaining, you should make a cross cut, about half an inch below the eye, and with your knife slit off the bud, with part of the wood to it : this done, you must with your knife pull off that part of the wood which was taken with the bud, obferving whether the eye of the bud be left to it or not; for all those buds which lose their eyes in tripping, are good for nothing: then having gently raifed the bark of the flock with the flat haft of your penknife clear to the wood, thrust the bud therein, observing to place it fmooth between the rind and wood of the flock, cutting off any part of the rind belonging to the bud that may be too long for the flit made in the flock; and fo having exactly fitted the bud to the flock, tie them closely round with bass-mat, beginning at the under part of the flit, and for proceeding to the top, taking care not to bind round the eye of the bud. which should be left open.

When your buds have been inoculated three weeks or a month, those which are fresh and plump you may be fure are joined; and at this time you should loosen the bandage, which if it be not done in time, will in-jure if not deftroy the bud. The March following cut off the flock floping, about three inches above the bud, and to what is left fasten the shoot which proceeds from the bud; but this must continue no longer than one year; after which the flock must be cut off close above the bud. The time for inoculating is from the middle of June to the middle of August: but the most general rule is, when you observe the buds formed at the extremity of the same year's shoot, which is a fign of their having finished their springgrowth. The first fort commonly inoculated is the apricot; and the last the orange-tree, which should never be done till the latter end of August. And in doing this work, you should always make choice of cloudy weather; for if it be done in the middle of the day, when the weather is hot, the shoots will perspire fo fast, as to leave the buds destitute of moisture.

INOCULATION, in a physical fense, is used for the transplantation of diltempers from one subject to another, particularly for the engraftment of the smallpox; which, though of ancient use in the Eustern countries, is but a modern practice among us, at least under the direction of art.

It is well observed by the Baron Dimidale, that accident hath surmished the art of medicine with many valuable hints, and some of its greatest improvements have been received from the hands of ignorance and barbarism. This truth is remarkably exemplified in the practice of inoculation of the small-pox: but to the honour of the British physicians, they medured not the value of this practice by the meanness of its origin, but by its real importance and utility; they partonifed a barbarous discovery with no lefs zee and

Inocula- affection than if it had been their own. Indeed the whole nation might be faid to have adopted the practice; for the greatest encouraged it by becoming examples, and the wifest were determined by the general event of the method.

As to the origin of the art of inoculating the fmallpox, as well as the time and place in which it was performed, they are equally unknown to all by whom the practice is adopted. Accident probably gave rife to it. Pylarini fays, that among the Turks it was not attended to except amongst the meaner fort. Dr Ruffel informs us in the Philosophical Transactions, vol. lviii. p. 142, that no mention is made of it by any of the ancient Arabian medical writers that are known in Europe; and the physicians who are natives in and about Arabia, affert, that nothing is to be found regarding it in any of those of a more modern date. He farther fays, that he engaged fome of his learned Turkish friends to make enquiry; but they did not difcover any thing on this fubject of inoculation either in the writings of phyficians, historians, or poets. Until the beginning of the 18th century, all the accounts we have of inoculating the fmall-pox are merely traditional. The filence on this fubject, observed amongst writers in the countries where the practice obtained, Dr Ruffel supposes, with great probability, to be owing to the physicians there never countenancing or engaging in it. It is also remarkable, that before Pylarini's letter to the Royal Society in 1701, nor yet for feveral years after, this practice is not noticed by any of the most inquisitive travellers. On this Dr Rufin diftant countries, are often the least apt to attract the observation of travellers, who, engaged in other purfuits, must be indebted to accident for the knowledge of fuch things as the natives feldom talk of, upon the belief that they are known to all the world.

The first accounts we have in the learned world concerning inoculation, are from two Italian physicians, viz. Pylarini and Timoni, whose letters on the fubject may be feen in the Philosoph. Trans. abr. vol. v. p. 370, &c. The first is dated A. D. 1701; the next is dated A. D. 1713. Whether our inquiries are extended abroad or confined to our own country, inoculation hath been practifed under one mode or other time immemorial; in Great Britain and its adjacent ifles we have well authenticated accounts, extending farther backward than any from the continent. Dr Williams of Haverfordweft, who wrote upon inoculation in 1725, proves, that it had been practifed in Wales, though in a form fomewhat different, time out of mind. Mr Wright, a furgeon in the fame place, fays, that buying the fmall pox is both a common practice, and of long standing in that neighbourhood. He fays, that in Pembrol eshire there are two large villages near the harbour of Milford, more famous for this custom than any other, viz. St Ishmael's and Marloes. The old inhabitants of these villages say, that it hath been a common practice; and that one William Allen of St Ishmael's, who in 1722 was 90 years of grity, that this practice was used all his time; that he well remembered his mother telling him, that it was a common practice all her time, and that she got the fmall-pox that way; fo that at least we go back 160 Inocula-

In the Highlands of Scotland and some of the adjacent isles, Dr Alexander Monro fenior informs us, that the custom through ages past hath been, to put favourable fmall-pox, and to tie worsted threads about their childrens wrifts, after having drawn them through

variolous puftules.

According to the refult of Dr Ruffel's inquiries, the Arabians affert, that the inoculation of the smallpox has been the common custom of their ancestors, and that they have no doubt of its being as ancient as the difease itself. It is remarkable, that buying the fmall-pox is the name univerfally applied in all countries to the method of procuring the difeafe: it is true that there are other terms; but in Wales and Arabia, as well as many other countries, this is the usual appellation. From the fameness of the name, and the little diverfity observable in the manner of performing the operation, it is probable that the practice of inoculation in these countries was originally derived from the same fource. From its extensive spread, it is probably of great antiquity too.

In the year 1717, Lady Mary Wortley Montague. wife of the English ambassador at Constantinople, had her fon inoculated there at the age of fix years; he had but few puftules, and foon recovered. In April 1721, inoculation was fuccefsfully tried on feven condemned criminals in London, by permission of his majesty. In 1722, Lady Mary Wortley Montague had a daughter of fix years old inoculated in this island; foon after which, the children of the royal family that had not had the fmall-pox were inoculated with fuccefs; then followed fome of the nobility, and the practice foon prevailed. And here we date the commence-

From the example of the royal family in England, the practice was adopted in Germany, particularly in

After Mr Maitland had fucceeded with those he had inoculated in and about London, he introduced the practice into Scotland in the year 1726.

Sweden foon followed the example of the British. Ruffia lately engaged one of our principal promoters and improvers of this art. And now there are not many countries that do not more or less practife it.

Different Modes of INOCULATION. The practice of inoculation having obtained in every part of the world, it may be grateful, at least to curiofity, to have a general account of the different modes that are and have

Inoculation with the blood of variolous patients bath been tried without effect: the variolous matter only

produces the variolous difeafe.

The application of the variolous matter takes place in a fensible part only; the activity of the virus is fuch, that the smallest atom, though imperceptible to any of our fenfes, conveys the difeafe as well as the largest quantity. Hence the most obvious method is the prick of a needle or the point of a lancet dipped in the matter of a variolous puffule.

Cotton or thread is used, that is previously rubbed with powdered variolous scabs; this thread is drawn Inocula- with a needle through the cutis, but not left in. This is the method in some parts of the East Indies. The Indians pass the thread on the outside of the hand, between any of the fingers, or between the fore-finger and thumb. The Theffalian women inoculate in the forehead and chin.

Some abrade the fearf-skin, and rub in the powdered dry feabs which fall from the puftules of patients

with the fmall-pox. Many of the Greek women make an oblique puncture with a needle, on the middle of the top of the forehead, on each cheek, the chin, each metacarpus, and each metatarfus; then drop in each a little of the pus just taken warm from a patient, and brought in a fervant's bosom. Others in Greece make several little wounds with a needle in one, two, or more places, in the fkin, till fome drops of blood enfue; then the operator pours a drop of warm pus fresh from a pustule, and mixes it with the blood as it issues out; then the wound is covered by fome with a bandage, by others with half a walnut shell placed with its concave fide over each orifice.

The Chinese convey a pellet of variolated cotton, with the addition of a little musk, into the nostrils of the patient; they collect dry puftules, and keep them in a porcelain bottle well corked; and when they inoculate, they mix a grain of musk with three or four grains of the dry fcales, and roll them in cotton. This method may be called inodoration.

About Bengal, in the East Indies, the person who intends to be inoculated, having found a house where there is a good fort of the fmall-pox, goes to the bed of the fick person, if he is old enough; or if a child, to one of his relations, and fpeaks to him as follows: " I am come to buy the fmall-pox." The answer is, "Buy if you please." A sum of money is accordingly given, and one, three, or five puffules, for the number muft always be odd, and not exceeding five, extracted whole, and full of matter. These are immediately rubbed on the skin of the outside of the hand between the forefinger and the thumb; and this fuffices to produce the difease. The same custom obtains in Algiers, Tunis, Tripoli, and other countries.

Very fimilar to the custom amongst the people about Bengal, &c. is that in Arabia, where on some fleshy part they make feveral punctures with a needle imbrued in variolous matter, taken from a pultule of a favourable kind. Here they buy the fmall-pox too, as follows: the child to be inoculated carries a few raifins, dates, fugar-plums, or fuch like; and showing them to the child from whom the matter is to be taken, asks how many pocks he will give in exchange? The bargain being made, they proceed to the operation; but this buying, though still continued, is not thought necessary to the fuccess of the operation. The Arabs fay that any fleshy part is proper; but generally they infert the matter between the fore-finger and thumb

on the outfide of the hand.

The Georgians infert the matter on the fore-arm. The Armenians introduce the matter on the two thighs. In Wales the practice may be termed infriction of the fmall pox. There some of the dry puffules are procured by purchase, and are rubbed hard upon the naked arm or leg.

The practice in some places is to prick the skin be-

tween fome of the fingers by means of two small needles Inneulas joined to one another; and after having rubbed a little of the matter on the spot, a circle is made by means of feveral punctures of the bigne's of a common puffule, and matter is again rubbed over it. The oneration is finished by dreffing the wound with lint .- Another custom is to mix a little of the variolous matter with fugar, and give it to be drank in any agreeable

Incifions have been made in the arms and legs, and thread, cotton, or lint, previously dipped in the variolous matter, was ledged in them. The practice of fome is to bathe the feet in warm water, and then fecure lint dipped in the variolous matter on the inflep, or other part of the foot, where the skin is thin. Others apply a fmall bliftering plafter; and when the fearf-skin is elevated and slipped off, the variolous matter is applied to the furface of the true fkin, and confined there by a little lint or plaster. Scratching the fkin with a pin or needle, and then rubbing the part with lint, previously dipped in variolous matter, is the custom in fome places.

In the Highlands of Scotland they rub fome part of the fkin with fresh matter, or dip worsted in variolous matter, and tie it about the childrens wrifts. They observe, that if fresh matter is applied a few days fuccessively, the infection is more certain than by one

application.

Objections to INOCULATION answered. I. " It is not lawful."

In answer to this, the Scriptures ask, Is it lawful to fave life, or to destroy it? Luke vi. 9. And as it is a difficulty with many ferious people, whether to admit of this practice or not, this objection should be confidered in a religious view. We should in this case remember, that as the fall of man brought the danger of difeafes into the world, fo to evade, oppose, or deftroy it, is not only his right, but duty, if in his power. And if events imply the cause, a long run of uninterrupted fuccefs implies an efficacious remedy. Though fome die under this management, it is fufficient to prove the lawfulness of a remedy, that it is proper for and has by experience been found in most cases effectual to the end for which it was used. When danger furrounds us, no conduct is more proper than to inquire into and purfue the means of escape. To neglect our fafety is to fink below the brutes, who by initinct avoid the evils to which they are exposed. Inoculation is a means of faving life in many inflances, and of moderating the feverity of affliction in more. Wilfully then to neglect the means of faving life is to be guilty of murder.

II. " It is bringing a diftemper on ourfelves, and fo

usurping the facred prerogative of God."

1. As to the first part of this objection, if by distempers are meant sickness and pain, that is practised daily in other inflances, in concurrence with the Scripture dictate, viz. of two evils choose the least. But the supposition of objectors in this instance is not altogether true. For by inoculation, a difease is not properly faid to be communicated. It only excites and frees us from one, which, though latent, is already in us: or (which in effect is the fame) inoculation, by an advantageous mode of infecting, &c. frees the patient in all instances from the usual difficulties of the disease :

Inocula- faves the life of most who submit to it; and with the balance the account, by examining the different de- Inoculanatural fmall-pox it destroys that disposition in the body, without which the difease cannot take place. It is owned that fome hazard attends it : it is fometimes mortal, and indeed it is fit it should be so: it is generally successful, that encourages us to proceed: it sometimes, though rarely fails; hence we are cautious and careful, and led to act with a dependence on Him to

whom belong the iffues from death. 2. Respecting the offence given to God; a reliance on Providence does not imply that we are not to prevent or oppose the evils which we foresee, and which we have in our power to guard against by prudent precautions. Would these objectors, in other instances, refuse the means of leffening the malignancy and danger of disease, than which the practice of inoculation is no more? Let these scrupulous persons say, whether, when God permits the discovery of preserving ourselves from an impending evil, he forbids our availing ourfelves of that discovery? If our Maker offers us a re-

III. " The decrees of God have fixed the commiffion of every difease, and our precautions cannot pre-vent what he hath determined."

However true it is that our days are determined, &c. yet it is God's revealed will, and not his fecret purpofes, which we are to regard as the rule of duty. God has required of us to have a tender regard to our lives; and those who disobev him herein are guilty of a degree of felf-murder, and will never be acquitted of that guilt by the fecret determination of Heaven concerning them. Befides, God who has ordained the end. has also determined the means leading to it. St Paul, in his dangerous voyage, had a special revelation to affure him, that all who were with him should escape; and yet when the feamen were getting out of the ship, he declares that if they did not flay in it they could not be faved, Acts xxvii. 31. God purposed to preferve them in the way whereby they were afterwards delivered.

IV. "We should not do evil that good may come." If inoculation is in its own nature a moral evil, it certainly should be rejected, however great its advantages may feem to be. The prospect of relief from any calamity in life should not tempt us to offend God. But those who make this objection proceed on a mistake. Their principle is true with regard to moral evil, but is not fo when applied to phyfical. It is certainly lawful to pull down a house to fave a great can hardly take place without fome degree of moral evil: and many other inflances may be pointed out, where, for a greater good, a leffer ill is submitted to. And is the small ill induced by inoculation to be compared with all those evils which are tolerated and autho-

V. "The patient may die; and then his last moments are diffressed, and the future reflections of his

be reasonable. They hope to escape the distemper in the natural way, and they have fears of dying in this; and thus they are prevented from going into it. But they should consider what grounds they have for either the one or the other, and what is to be advanced to grees of probability that attend their hopes and fears in the use or neglect of inoculation. Dying is a serious thing : but if inoculation be a probable and lawful means of preferving life in a time of danger, it is a duty to comply with it; and what more peaceful reflection than to die in the way of duty?

VI. " Fear is a dangerous paffion in the fmall pox; but inoculation increases the causes of fear, by lessen-

ing our faith and trust in God."

When the small-pox is left to nature, such are its ravages, that not to fear would be to fink beneath humanity: its confequences are too grievous to be treated with neglect. But experience manifelts the fafety that attends receiving the difease by inoculation: it is therefore fo far a remedy to that just fear which enhances the danger when the difease is left to itself. is agreeable to the Scripture; and a difregard to calamities and dangers is never the effect of that. Inoculation is a means of fafety; and it is as rational to conclude, that our lives should be preserved without eating and drinking, as that we shall be delivered from danger without a prudent care for our own fafety. We are to depend on the care of Providence only in the way of duty. To boaft of courage and truft in God, while we omit the means of escaping danger which furrounds us, is not faith, but prefumption. Thus, when inoculation becomes a probable means by which to fave life, it is a prefumption. and not truft, to neglect it.

VII. " Inoculation does not exempt from future in-

fection."

If by inoculation of the small-pox the same disease is produced, the same effects may be expected from it when artificially produced as in the natural way. It isinconceivable, that a contagious substance, the very feminal matter of the small-pox, should propagate, in-Itead of its own, another difeafe. De Haen is an acute physician, and was a violent opposer of inocumatter of the fmall-pox will produce any difease but itself. Observation alone determined the opinion, that the natural small-pox does not attack a second time; the fame thands good in favour of the artificial difeafe. And to this numberless trials have been made without effect, to reinfect those in whom the small-pox had taken place by inoculation.

VIII. "Other difeafes are communicated with the

matter of the fmall-pox, by inoculating it."

That carelessness or wilfulness in the operator may in some instances give cause for this objection is true; but that by the matter of a variolous pultule, any other disease hath been conveyed, is yet to be proved. As the confluent and malignant small-pox have not yet been observed to produce their own degree and mode of this diftemper when infused by inoculation, it is scarcely conceiveable that they should transmit another disease effentially different. The venereal disease is known to be as communicable as any; yet feveral have been inoculated from patients labouring under confiderable degrees of the venereal difeafe, and no ill confequences ever yet were known to follow, none to give the least suspicion of the kind. If the variolous matter may convey another disease in the artificial, it may do

Inocula- do the fame in the natural way; and even then, advantage is attendant on inoculation, for we can choose a healthy person to take the infection from; but no instance of the kind hath ever occurred.

IX. " Perhaps the difease may never attack in the

natural way."

Such objectors should be informed, that this distemper cannot be given to one who never would have it; for they only who are susceptible of it can take it by inoculation, as is evident from numerous experiments made to verify this fact. Again, the fmall-pox may be faid to be general; fo few there are who are exempted from it, that they can hardly be confidered as an exception to the general law : it is therefore worth while to inoculate, first, to ascertain the safety of the individual from the difease; and, secondly, on account of the general advantages of this practice, in case he fhould be susceptible of the infection. On this subject Dr Jurin hath inferted an ingenious paper in the Philosophical Transactions; in which he observes, that it is difficult to afcertain the exact number who die without having the fmall-pox; but that, of all the children that are born, there will fome time or other die of the fmall pox one in fourteen; and that of persons of all ages taken ill of the fmall-pox, there will die thereby two in eleven. From a table of burials it appears, that in Edinburgh and St Cuthbert's parish, during ten years, about one-tenth of the dead were killed by the fmall pox. Farther, as it cannot be known that any individual is exempted from the fmall-pox, his hazard of dying of that diftemper, being made up of the hazard of having it, and the hazard of dying of it if he has it, will be exactly the same, viz. that of one in eight or nine (whether the proportion of mankind that escape having the small-pox be great or small). In inquiry from house to house for the number of people with the finall pox, in feveral towns, during one year, it appeared that near one in five died who had them; and that of eighty-two persons who were inoculated in these places in the same year, not one died.

X. "It requires much thought to know what we

fhould do with regard to inoculation."

Not to dwell on the abfurdity of this objection, and of complaining that confideration is a burden when it is necessary for the preservation of life, it may suffice to point out, that a facred writer tells us, that " a prudent man foreseeth the evil, and hideth himself; but fools pass on and are punished."

X1. " It endangers others." Since very few of mankind now escape the smallpox, it mult fooner or later come to every place; therefore, if it be true in fact that a much greater number lofe their lives by the natural than by the artificial infection, it is of more service to introduce the smallpox in a favourable way and feafon, than paffively to allow it to destroy multitudes. As to spreading the difease by introducing inoculation, it is but of little confequence; for inoculating where the difease does not already exist, is differently circumstanced from this practice, where it already prevails in the natural way; the quantity of the circumambient contagion is less, or the same extent of atmosphere is less impregnated with the infectious principles from inoculated patients, than when it naturally prevails, or the fame number of people received it in the natural way.

Nº 167.

The most plausible objector on this account is Dr Inocula-Raft, of Lyons, in France. From his review of the bills of mortality in and about London, he observes, " that more have died by the fmall-pox in London, fince the introduction of inoculation, than in the same time preceding that period, in confequence of the difease thereby being more universally extended and propagated." But to this, Dr Lettfom most fatiffactorily replies, "That the late increase of burials cannot depend upon the practice of inoculation, under which, though it is a rare thing to hear of a fatal case, but rather upon the innovation introduced in the treatment of the natural fmall-pox of expofing the patients to the open air, and a less referved intercourse amongst the community. Add to this the improvements in medicine in various instances, the police of the city, &c. which by preferving many lives occasion more subjects for the small-pox, and confequently a proportional increase of deaths by this difease, many of those who are preserved by the above named improvements not being favoured with the advantage of inoculation. Besides the care taken in and about London to prevent inconvenience from inoculation, &c. it should be remembered, that the increafing accession of young persons to the capital from the country, eafily accounts for the increase of 19 deaths in 1000 more than formerly happened." See a Defence of Inoculation, in Dr Lettfom's Medical Me-

XII. "The practice of inoculation comes from the devil."

The best answers to this feem to be, first, that cavillers will never cease from objecting; and oppositions will be made as long as there are men of wit to devife, or of fophistry to invent. Secondly, that Job was afflicted by the devil with the small-pox, is not a known fact. Thirdly, that if by what is faid the principal objections are removed, it is hoped that the reasonable and the religious will be enabled to approve themselves to God in the practice of inoculation. See a discussion of most of the preceding objections in an excellent pamphlet, entitled, "Inoculation impartially confidered, and proved to be confident with Reason and Revelation," by the Rev. Mr David Some, published by Dr. Doddridge in 1750.

Advantages of INOCULATION. Though no difease, after it is formed, baffles the powers of medicine more than the fmall-pox, yet more may be done before-hand to render this difease favourable than in any other we know. The artificial method of producing the fmallpox hath almost stripped it of its terrors; in general, hath rendered its aspect mild, its progress uniform, and

nearly without hazard to the patient.

Mr Mudge, in his Differtation on the inoculated Small-pox, enumerates the following fources of danger from this difease, viz. 1. The patient's conflictution.
2. The propensity of the patient to be infected. 3. The manner or mode of the infection being communicated. 4. The conflitution of the air at the time of infection. And it is the advantage of inoculation, if prudently conducted, almost totally to exempt its fubiects from the disadvantages attendant on these

1. " Respecting the habit of body, or state of the patient's conftitution at the time of infection."

Confti-

not interfere with the course of the small-pox, whether in its natural or its artificial progress; such as scorbutic eruptions on the fkin, frumous complaints, itch, fcabby eruptions, excoriated ears, &c. The variolous poison is therefore a thing fui generis, and noways affected by these taints of the juices, or what is usually called a bad habit of body; or at least fo inconfiderably, as not to deprive such patients of any of the advantages of inoculation. But the case is much reverted with respect to some actions at alleases. E. gr. If on the nature or the small pox, the habit or its attending circumstances tend to inflammation, or, on the contrary, to a putrid acrimony, the eruptive fever in thefe aggravated flates will load the body with variolous matter, or produce pultules of a very unfavourable kind; in either of these cases (not to enumerate more) the patient will most probably be severely affected. But inoculated subjects may be infected when the conflitution is in the best condition to combat with the disease; if either of those indispositions are attendant, or any other which usually endangers, they may foon be reftrained or removed.

2. " The different degrees of propenfity in the pa-

tient, at different times, to be infected."

That different quantities of matter are produced in different persons in the process of the disease, we find true in fact; and there is the ftrongest reason to believe, that, previous to infection, the quantity of the variolous matter, or rather that principle in the conftitution which eventually produces it, ebbs and flows, is more or less vigorous at different times in the same fubject, under various combinations of circumftances. The inflances are not uncommon, where the patient who hath withflood at one time all the ordinary means of infection, nay, who hath industriously, but ineffectually, fought it; yet at another hath had a fmall-pox fo malignant in appearace and effect, that the whole body hath been converted into an offensive variolous putrescence. If the degree of propensity to receive infection was always the fame, it would be inconceivable that any one could pass unaffected when the small pox became epidemic. From whatever causes, however, this propenfity may arise, it is most reasonable to asfert, that the increase or decrease of this principle takes place according as the fmall-pox is epidemic or. not. During the continuance of any contagious epidemic disease, we always find that those constitutions which are most congenial with that character, are peculiarly obnoxious to the correspondent distemper. And we may reasonably conclude, that when the conflitution of a person not past the small-pox is most faturated with the variolous principle, he is then more particularly fubject to infection. Again, it is not only undoubted, that the variolous principle fubfifts in the constitutions of persons not past the small-pox, but it is more than probable that a part of this principle is produced by the eruptive fever, and the rest of the variolous process. Agreeably to what hath been faid, we find, that during the epidemic tendency, those who have not passed the disease, are more open to contagion than in other constitutions of air, when the smallpox is not epidemic, and is confequently a rare difease. Many who have escaped infection from inoculation and other means of contagion, on removal into a fituation

Vol. IX. Part I.

Conflitutional or habitual difeafes, in general, do where the fmall-pox has been epidemic, have prefently lnoculaafter been feized with this diforder. Events of this kind are fo common, as to have given rife to the ill grounded opinion, that any change of air is hazardous to those who have not had the small pox. If at a time when the propenfity to be affected is the greatest. there should be a concurrence of those flator of the conflitution above noticed, how aggravated will the adicion of the patient be !

Respecting the evalion of these inconveniences by inoculation, it is to be observed, that as the propensity. to the difease differs at different times in the same subject, it is reasonable to suppose that the disorder is produced by downright violence, when there fubfills in. the patient but little of that peculiarity of constitution fo effential to the production of the difease (and fogeneral, when the small-pox is epidemical), or, in other words, when the body is indisposed to be poisoned. This confideration, peculiar to the difease when. artificially produced, appears to be the true cause of the fmall quantity of pocky matter, and that general fearcity of pultules, when compared to the naturalfmall-pox, which has ever accompanied inoculation, and is one of the grand advantages of the discovery. Farther, as it is very reasonable to suppose, that this propenfity is the greatest when there is an epidemic conflitution of the air which favours the production of the difeafe; and if it be as probable that the feverity or mildness of the disease depends in a good degree uponthe greater or leffer propenfity of the fubiect to be infeeted; it will certainly be an eligible ftep not to bring on the diforder by inoculation during the continuance. of an evidently prevailing tendency to the disease. Prudence in this case directs us to take advantage of the absence of such a prevailing tendency, when all the benefits of inoculation may be feeured; and not to delay the operation, till fuch a constitution of air prevails, as at once makes the operation necessary, and deprives it of some of its advantages. To conclude, we may add to this confideration, that by the practice of exposure to cold, the violence" of the eruptive fever is fo far moderated, as to prevent its forming an additional quantity of variolous matter, which, in a violent and unrestrained state, it would do, by affimilating the juices of the conflitution into the nature of the vario-

3. " The manner or mode of the infection being communicated."

In the natural fmall-pox, the difease may be produced by accidental contagion, or an epidemic influence. Dr Mead fays, that the air of this climate never produces the plague, fmall-pox, or meafles; and Dr Arbuthnot fays, that the plague itself may be generated by fome quality in the air, without any contagion. Be these opinions as they may, it is evident that contagion is fometimes fo languid, that it requires the agency of other causes to give it activity, so as to produce the tribe of difeases to which it belongs, and which without this agency would never be brought forth; and though the strongest epidemic tendency may not in Europe create the small pox, without the concurrence of contagious fomes, yet there is, by the agency of the former, fuch an alteration made, and propenfity brought on the animal juices, as is effentially necessary to continue the existence of the disease. Varioloua:

application of its poifon, either externally, through their furface, have no diffress to proclaim by a feconflomach, and guts, in the act of deglutition; or laftly, to the lungs, in the act of refpiration. Though there may be a possible admission of the poisonous miasmata the discourse adminior of the pointing of the principle of abforption; yet the pointing very feldom, if ever, exerts its influence upon the habit in this manner. possibly by a local actual application of the gross matter lodged in the cloaths, or otherwise conveyed, the diftemper may fometimes be produced by a kind of inoculation, and then the diforder will probably be favourable. But when the poison, in a more dilute state, only floats in or impregnates the air, it feldom enters the pores of the fkin and poisons by way of absorption; for the degrees of activity in which this power is exerted, are most probably in proportion to the aids the constitution may stand in need of from it. However, it is more than probable that the ordinary mode of infection is by the lungs, which from their structure they are well calculated to receive, to entangle, and to retain. When either the lungs or the flomach are first infected by the infectious effluvia, it is most reasonable to believe, that thefe noble parts, together with the fauces, glottis, wind-pipe, and gullet, will frequently labour under a greater load of puffules than the external furface of the body: for it is observed, that when the patient is infected artificially, the parts to which the poison is applied suffer in a greater degree than the more diftant ; and that the circumiacent Ikin, to fome extent, is filled with pultules. From this particular application of the morbid matter to the fauces, &c. it is probable, that the large discharge of feliva, &c. arifes, which characterizes the confluent fmall-pox in adults; and as children fwallow this faliva. it excites a diarrhoca, which in them answers to the fpitting in those more aged. When the internal parts are oppressed with pustules, there is no interval between the eruptive and the fubfequent symptomatic fever; and the fuffering which the patient labours under from a generally inflamed skin, heightened by the difeafed condition of the nobler parts, perpetuates the first fever. This informs us that all is not so well within as otherwise the external appearances might have induced us to believe; but that the nobler parts are rendered unfit for the purposes of life, at least are labouring and lagging behind in the process, fo that they have not kept pace with the apparent state of the difease on the furface of the body: this fome have Supposed to be the true general cause of the secondary fever, under which the patient, if he finks, dies peripneumonic. Thefe confequences frequently attend the infection received in the natural way; and if, superadded to thefe, the unhappy fituation of those described under the first and second sources of danger attends the patient, the diforder will be proportionably aggravated, and the chance of life leffened.

But here again inoculation relieves: for by this mode the virus is applied to the external furface of the body, fo that the whole constitution (excepting the part immediately furrounding the wound) being affected uni formly, the process of the difease is regularly carried

Trocula. Variolous contagion produces its effects by the actual ed by a partial application of the variolous fomes to Insculethe medium of the ikin; or internally, to the gullet, dary fever, which therefore is fearcely ever feen in incoculated patients.

4. " The constitution of the air at the time of infection."

A powerful fource of difficulty and danger in the natural fmall-pox is, the malignant influence of the air at some feasons, and particularly if it happens at the one or more of the other formers how dreadful the devaftation! Whether this conflitution of the -- produces its deleterious effects by heightening the natural malignity of the infecting poilon, or acts on the constitution itself so as to render the effects of contagion more peculiarly fatal, the consequence of this state of the air is the same. The general characters of a morbid flate of the air are the inflammatory and putrid; and it is uniformly observed, that whenever a perfon is attacked with a fever under either of thefe prevailing difpolitions, it never fails to imprefs its character upon the difeafe.

But here also inoculation affords the most benign influence. The judicious practitioner does not expose his patient to the pernicious effects of an air that can stamp its baneful character on the fmall pox, but chooses the season best calculated for the fafety and welfare of his patient; and hence we rarely fee the influence of this evil fource attendant on the artificial difeafe.

Having feen, that from the influence of one or more of these four fources of difficulty and danger, and that from their union will refult a natural small-pox, complicated with horrors not less to be dreaded than the plagne; how inestimable must appear that favour of Providence, by which we are freed from the formidable attendants of this difease, viz. inoculation, by which the diforder is rendered mild, and in general lefs hazardous than a common cold!

From attention to the above fources of ill in the natural small-pox, we perceive with sufficient satisfaction the many inflances of relief and fecurity which generally we avail ourselves of by inoculation; a part of which we have feen, and a few others follow.

1. As already observed, it saves the lives of most who are its fubjects. From a general calculation it appears, that in the hospitals for small-pox and inoculation, 72 die out of 400 patients having the diftemper in the natural way, and only one out of this number when inoculated. 2. It lessens the affliction from both the degree and the number of ill fymptoms, even when it proves fatal. It leffens the number of puftules; and, by moderating the virulence of the difeafe, the marks on the face are not fo deep. 3. It is extremely rare that the secondary fever attends it; a fymptom productive of much fuffering, if the patient is happy enough to escape with life. 4. It produces the difease under the sewest difadvantages, and favours with forefight to prevent many ills not to be guarded against in the natural small-pox. 5. Instead of communicating other diforders with it, many diforders fubfequent to the natural are very rarely observed after the artificial small pox. 6. It effectually removes all on; and the nobler parts not being particularly affect- just grounds of fear; a passion very injurious in this difeafe.

Profeula- difeafe. 7. Soldiers, failors, and all who would appear abroad, or in public offices, are freed from every anxi-Inquision, ety and hazard attendant on the natural small-pox. 8. Servants, women with children at their breafts, pregnant women, magistrates, physicians, &c. are all freed from the most distressing embarrassment, by conformity to inoculation. See MEDICINE.

INOSCULATION, in anatomy; the same with

ANASTOMOSIS.

INPROMPTU, or IMPROMPTU. See IMPROMPTU. INQUEST, in Scots law, the same with Juny. INOUISITION, in the church of Rome, a tri-

bunal in feveral Roman Catholic countries, erected by the popes for the examination and punishment of

This court was founded in the 12th century by father Dominic and his followers, who were fent by Pope Innocent III. with orders to excite the Catholic princes and people to extirpate heretics, to fearth into their number and quality, and to transmit a faithful account thereof to Rome. Hence they were called inquifitors; and this gave birth to the formidable tribunal of the inquifition, which was received in all Italy and the dominions of Spain, except the kingdom of Naples and

This diabolical tribunal takes cognizance of herefy, Judaism, Mahometanism, Sodomy, and polygamy; and the people stand in fo much fear of it, that parents deliver up their children, husbands their wives, and mafters their fervants, to its officers, without daring in the leaft to murmur. The prisoners are kept for a long time, till they themselves turn their own accufers, and declare the cause of their imprisonment; for they are neither told their crime nor confronted with witnesses. As foon as they are imprisoned, their friends go into mourning, and speak of them as dead, net daring to folicit their pardon, left they should be brought in as accomplices. When there is no shadow of proof against the pretended criminal, he is discharged, after fuffering the most cruel tortures, a tedious and dreadful imprisonment, and the loss of the greatest part of his effects. The fentence against the prifoners is pronounced publicly, and with extraordinary folemnity. In Portugal, they erect a theatre capable of holding 3000 persons; in which they place a rich altar, and raise seats on each fide in the form of an amphitheatre. There the prifoners are placed; and over-against them is a high chair, whither they are called, one by one, to hear their doom, from one of the inquifitors.

Thefe unhappy people know what they are to fuffer by the clothes they wear that day. Those who appear in their own clothes are discharged upon payment of a fine : those who have a fanto benito, or ftrait yellow coat without fleeves, charged with St Andrew's crofs, have their lives, but forfeit all their effects: those who have the resemblance of flames, made of red ferge, fewed upon their fanto benito, without any crofs, are pardoned, but threatened to be burnt if ever they relapfe: but those who, besides these flames, have on their santo benito their own picture, furrounded with figures of devils, are condemned to expire in the flames. The inquifitors, who are ecclefialtics, do not pronounce the fentence of death; but form and read an act, in which they fay, that the criminal being convicted of fuch a crime, by his Inferibed own confession, is with much reluctance delivered to the fecular power to be punished according to his demerits: and this writing they give to the feven judges who attend at the right fide of the altar, who immediately pais fentence. For the conclusion of this horrid scene, fee Acr of Faith.

Infects.

INSCRIBED, in geometry. A figure is faid to be inferibed in another, when all its angles touch the

fide or planes of the other figure.

INSCRIPTION, a title or writing affixed to any thing, to give some farther knowledge of it, or to trans-

mit some important truth to posterity.

Antiquaries are very curious in examining ancient inscriptions found on stones and other monuments of antiquity. Sanchoniathon, contemporary, as it is faid, with Gideon, drew most of the memoirs whereof his history is composed, from inscriptions which he found in temples and on columns, both among the Heathens and the Hebrews.

It appears, indeed, that the ancients engraved upon pillars the principles of sciences, as well as the history of the world. Those mentioned by Herodotus show, that this was the first way of instructing people, and of transmitting histories and sciences to posterity. This is confirmed by Plato in his Hippias; wherein he fays, that Pifistratus engraved on stone-pillars precepts useful for hufbandmen. Pliny affures us, that the first public monuments were made of plates of lead: and that the treaties of confederacy concluded between the Romans and the Jews were written upon plates of brass; that (says he) the Jews might have fomething to put them in mind of the peace and confederacy concluded with the Romans. The Greeks and Romans were great dealers in infcriptions, and were extremely fond of being mentioned in them: and hence it is, that we find fo many in those countries of ancient learning, that large volumes have been composed as the collection of Gruter, &c. Since Gruter's collection, Th. Reinefius has compiled another huge volume of inscriptions. M. Fabretty published another volume at Rome in 1699, wherein he has corrected abundance of errors which had escaped Gruter, Reinefius, and other antiquaries, &cc. and added a great number of infcriptions omitted by them .- Since all these, Gravius has published a complete collection of inscriptions, in three volumes folio.

INSCRUTABLE, UNSEARCHABLE, in theology. is usually understood of the fecrets of Providence, and the judgments of God, which cannot be found out, or into which human reason cannot penetrate.

Academy of INSCRIPTIONS. See ACADEMY. INSECTS, INSECTA, in natural history, a smaller fort of animals, commonly supposed to be exsanguious; and diffinguished by certain incifures, cuttings, or indentings in their bodies. The word is originally Latin, formed of in, and feco " I cut;" the reason of which is, that in some of this tribe, as ants, the body feems to be cut or divided into two; or because the bodies of many, as worms, caterpillars, &c. are composed of different circles, or rings, which are a fort of incifuræ. See Zoology and Entomology.

Of the Kinds of INSECTS, and where the Collector for the Cabinet may find them. Infects, in general, are known to most people, the systematic distinctions but

Li 2

part of them. The general denominations of beetles, butterflies, moths, flies, bees, wasps, and a few other common names, are all that our language fupplies. It would, therefore, be in vain to enumerate the immense variety of genera and species to any person unskilled in the science of entomology: we may, however, give directions under general names where to find each kind.

The class of infects is divided by Linnæus into feven

orders. See ZOOLOGY and ENTOMOLOGY.

I. The Coleoptera kind. Many of these (as the scarabaus or chaffer, dermestes or leather-eater, bister or mimick-beetle, flaphylinus or rove-beetle, &c.) are found in and under the dung of animals, especially Lettfeme's of cows, horfes, and sheep. Some (as lucanus or stag-Natural P's beetle, cerambyx or capricorn beetle, dermestes, &c.) and Travel- are found in rotten and half-decayed wood, and under Ler's Compathe decayed bark of trees. Others (as hifter, filpha or carrion beecle, flaphylinus, &c.) on the carcales of animals that have been dead four or five days; on moift bones that have been gnawed by dogs or other animals; on flowers having a fetid fmell; and on feveral kinds of fungous fubitances, particularly the rotten and most stinking. Others (as byrrhus, turculio or weevil, bruchus or feed-beetle, &c.) may be found in a morning about the bottoms of perpendicular rocks and fand-banks, and also upon the flowers of trees and herbaceous plants. Many kinds (as gyrinus or whirl-beetle, dytifcus or water-beetle, &c.) may be caught in rivers, lakes, and ftanding pools, by means of a thread net, with small meshes, on a round wirehoop, fixed at the end of a long pole. In the middle of the day, when the fun thines hot, fome (as the coccinella or lady-fly, bupreflis or burn-cow, chrysomela or golden honey-beetle, cantharis or fost-wingedbeetle, elater or spring-beetle, necydalis or clipt-winged beetle, &c.) are to be feen on plants and flowers, blighted trees and shrubs. Others (as lampyris or glow-worm, &c.) frequent moist meadows, and are best discovered at night, by the shining light which they emit. A great variety fit close on the leaves of plants, particularly of the burdock, elecampane, colts foot, dock, thiftle, and the like, (as the caffide or tortoife beetle, &c.); or feed on different kinds of tender herbs (as the meloë or blifter-beetle.) Numbers (as the tenebrio or stinking-beetle,) may be found in houses, dark cellars, damp pits, caves, and fubterraneous passages; or on umbelliferous flowers, (as the cerambyx, ptinus, &c.); or on the trunks as well as on the leaves of trees, in timber-yards, and in the holes of decayed wood. Some (as the leptura or wood beetle, cicindela or gloffybeetle, &c.) inhabit wild commons, the margins of pools, marshes, and rivulets; and are likewise seen creeping on flags, reeds, and all kinds of waterplants. Multitudes (as the carabus or ground-beetle) live under stones, moss, rubbish, and wrecks near the shores of lakes and rivers. These are found also in bogs, marshes, moist places, pits, holes of the earth, and on stems of trees; and in an evening they crawl plentifully along path-ways after a shower of rain. Some (as the forficula or earwig) may be discovered in the hollow flems of decayed umbelliferous plants and on many forts of flowers and fruits.

II. Hemiptera. Some of these (as the blatta or cock-

Infects. to few : nor have we any English names for the greatest roach) are found about bake houses, &cc. ; others (as Infects. the mantis or camel-cricket, gryllus or locust, fulgora, cicada, or sea-locust, cimen or bug, &c.) on grass, and all kinds of field-herbage. Some (as natonedla or hoatfly, nepa or water-scorpion, &c.) frequent rivers, lakes,

and standing pools.

III. Lepidoptera. In the day, when the fun is warm, butterflies are feen on many forts of trees, fhrubs, plants, and flowers. Moths may be feen in the day-time, fitting on pales, walls, trunks of trees, in shades, out-houses, dry holes, and crevices; on fine evenings, they fly about the places they inhabit in the day-time : fome (as the fphinx or hawk-moth) are feen flying in the day-time over the flowers of honeyfuckles and other plants with tubular flowers. Infects of this species feldom fit to feed, but continue vibrating on the wing, while they thrust the tongue or proboscis into the flowers.

IV. Neuroptera. Of thefe, fome (as the myrmeleon. hemerobius or pearl-fly, raphidia or camel fly, &c.) are found in woods, hedges, meadows, fand-banks, walls, pales, fruits, and umbelliferous flowers. Others (as libellula or dragon-fly, ephemera or may-fly, phryganea or fpring-fly, &c.) fly about lakes and rivers in the

V. Hymenoptera. These, including wasps, bees, &c.

frequent hedges, shrubs, flowers, and fruits.

VI. Diptera. Flies of various kinds constitute this class; of which some (as aftras or gad-fly, musca or fly, tabanus or whame) fly about the tops of trees, little hills, horfes, cows, theep, ditches, dunghills, and every offensive object. Others (as tipula, conops, afilus or wasp-fly, &c.) are found on all forts of flowers, particularly those of a fetid fmell.

VII. Aptera, or those without wings, comprehend

fcorpions, spiders, crabs, lobsters, &c.

Of Catching and Preferving INSECTS for Collections. In the following directions, we shall relate the methods of killing them the most readily, and with the least pain, as the purfuit of this part of natural history hath been often branded with cruelty; and however reasonably the naturalist may exculpate himself by pleading the propriety of submitting to an evil which leads to useful discoveries, yet for wanton cruelty there never can

be a just pretext.

1. The first class, confisting of beetles (coleoptera), are hard-winged. Many kinds fly about in the day, others in the evening, fome at night only. They may be caught with a gauze-net, or a pair of forceps covered with gauze. When they are taken, flick a pin through the middle of one of the hard wings, and pafs it through the body. They may be killed inftantly, by immerfion in hot water, as well as in spirit of wine; then flick them on a piece of cork, and afterwards carefully place their legs in a creeping position, and let them continue exposed to the air until all the moisture is evaporated from their bodies. Beetles may also be preferved in spirit of wine, brandy, or rum, closely corked up.

2. Infects of the fecond class (hemiptera) may be killed in the fame manner as beetles, and likewife by means of a drop of the etherial oil of turpentine applied to the head; or in the manner to be described under

the next class for killing moths.

3. The division of butterflies and moths, (lepidopte-

infects. ral, as well as all flies with membranceous wings, pin-cushion with three or four different fizes of pins Infects. should be catched with a gauge net, or a pair of to suit the different sizes of infects.

gauze forceps: when taken in the forceps, run a pin through the thorax or shoulders, between the forewings. After this is done, take the pin by the head, and remove the forceps, and with the other hand pinch the break of the infect, and it will immediately die: the wings of butterflies should be expanded, and kept fo by the pressure of small slips of paper for a day or two. Moths expand their wings when at reft, and they will naturally take that polition.

The larger kinds of these insects will not so readily expire by this method, as by flicking them upon the bottom of a cork exactly fitted to the mouth of a bottle, into which a little fulphur had been put, and by gradually heating the bottle, till an exhalation of the fulphur take place, when the infect inflantly dies, with-

out injuring its colours or plumage.

The best method of having the most perfect butterflies is to find out, if possible, the larva or caterpillar of each, by examining the plants, shrubs, or trees, they ufually feed upon, or by beating the shrubs and trees with long poles, and thereby shaking the caterpillars into a sheet spread underneath to receive them; to put them into boxes covered with thin canvas, gauze, or cat-gut, and to feed them with the fresh leaves of the tree or herb on which they are found; when they are full grown, they will go into the pupa or chryfalis flate, and require then no other care till they come out perfect butterflies, at which time they may be killed, as before directed. Sometimes these insects may be found hanging to walls, pales, and branches of trees, in the chryfalis state.

Moths might likewife be procured more perfect, by collecting the caterpillars, and breeding them in the fame manner as butterflies. As the larvæ or caterpillars cannot be preserved dry, nor very well kept in spirit, it would be satisfactory if exact drawings could be made of them while they are alive and perfect. It may be necessary to observe, that in breeding these kinds of infects, fome earth should be put into the boxes, as likwife fome rotten wood in the corners; because, when the caterpillars change into the pupa or chryfalis state, some go into the earth, and continue under ground for many months before they come out into the moth state; and some cover themselves with a hard shell, made up of small pieces of rotten wood.

4. The fourth class of infects (neuroptera) may be killed with spirit of wine, oil of turpentine, or by the

fumes of fulphur.

5. Those of the next class (hymenoptera) may be killed in the fame manner. A pin may be run through one of their wing-shells and body.

6. Infects of the fixth class (diptera) may likewife

be killed by spirit, or by fumes of sulphur.

7. Those of the last division (aptera) are in general fubjects which may be kept in spirit.

When in fearch of infects, we should have a box fuitable to carry in the pocket, lined with cork at the bottom and top to flick them upon, until they are brought home. If this box be strongly impregnated with camphor, the infects foon become stupisied, and are thereby prevented from fluttering and injuring their plumage. Befides a fmall forceps, the collector

In hot climates infects of every kind, but particularly the larger, are liable to be eaten by ants and other fmall infects; especially before they are perfectly dry: to avoid this, the piece of cork on which our infects are fluck in order to be dried, should be suspended from the cieling of a room, by means of a flender firing or thread; befmear this thread with bird-lime, or fome adhefive substance, to intercept the rapacious vermin of those climes in their passage along the

After our infects are properly dried, they may be placed in the cabinet or boxes where they are to remain: these boxes should be kept dry; and also made to shut very close, to prevent small insects from defroving them : the bottoms of the boxes should be covered with pitch, or green wax, over which paper may be laid; or, which is better, lined with cork, well impregnated with a folution of corrofive fublimate mercury in a faturated folution of crude fal-ammoniac in water, an ounce of which will diffolve 20 fcruples of the fublimate.

The finest collections have been rained by small infects, and it is impossible to have our cabinets too fecure. Such infects as are thus attacked may be fumigated with fulphur, in the manner described for killing moths; if this prove ineffectual, they may be immerfed in spirit of wine, without much injuring their fine plumage or colours, and afterwards let them be fprinkled about their bodies and infertions of the wings with the folution above mentioned. But baking the infects in an oven, in the manner described for BIRDS (under that article), is the most effectual method. of extirpating these enemies; however, the utmost caution is requifite in this process in regulating the heat of the oven.

N. B. All kinds of infects having no wings, may be preferved in spirits, brandy, or rum; except crabs, lobiters, and the like, which may conveniently be preferved dry.

INSECTS giving Root to Plants. Of this we have an account, by Mr Fourgeroux, in the Memoirs of the Academy of Sciences for 1769. The plants, of which Mr Fourgeroux gives an account, are perfectly the reverse of the worm-plant of China, described by Mr Reaumur in the year 1726. For, in that case, a worm fixes its fnout into the extremity of the plant, and derives nourishment from it. But the plants, of which an account is here given, derive their nourishment from

The greatest part of the animal-plants which he has feen, grow, he tells us, on the chryfalis of a species of cicada. The plant growing on these infects has got the generic name of clavaria, because its stalks and branches, when it has any, are terminated by tubercles, which give the appearance of little clubs. The root of this plant, in general, covers the body of the infect, and sometimes is even extended over its head. When these productions have for some time been preferved in spirits, the plant and animal may be separated from each other without hurting either. Small grooves, formed by the rings of the animal, may be observed running cross the roots of the plant : but no should have a large musqueto gauze net, and also a vestige can be found of the root's having any where

Infects. penetrated the body of the infect. Thefe plants produce fibres differing in length and number. The fibres are terminated by tubercles, which, before the plant arrives at maturity, are folid; but, after that period, they are found punctured, probably by worms which have fuffered a metamorpholis upon escaping from

> According to Mr Fourgeroux, plants grow, not only on the chryfalis of the cicada, but upon the cicada itfelf. He faw one of this kind upon a cicada brought from Cayenne. The plant, in this case, differed from the clavaria already mentioned. It was a species of fucus, composed of long, white, filky fibres, covering the body of the infect, and extending from feven to eight lines above and below its belly.

> The author has found the clavaria growing upon worms. He has found it chiefly upon worms, which, fuffering a metamorphofis, become afterwards a fmall species of May-bug. This chrysalis, he observes, is very different from that of the cicada; and, even in its worm-flate, may eafily be diffinguished from it.

After describing these different species of animalplants, the author next proceeds to offer his opinion upon this fubject. He first considers what had been See Vege. faid by Dr Watson, in the Philosophical Transactions, table FLY. concerning the vegetating-fly of the Caribbee islands *. Dr Watfon's account of these flies is, that they bury themselves about the month of May, and begin to be metamorphofed in June; and that the little plant which grows upon them refembles a branch of coral, is about three inches in height, and carries small protuberances, where worms are generated, which are again converted into flies. The author imagines, that, in this account, Dr Watfon has been deceived by the worms, which he has already observed will eat into the clavaria, and undergo a change in the holes which they have there made. Mr Fourgeroux is rather inclined to adopt the opinion of Dr Hill, founded upon observations made at Martinico, There the cicadæ are very frequent; and, during their chryfalis state, bury themfelves among dead leaves, to wait their metamorphofis. Dr Hill imagines, that the feeds of the clavaria are then attached to them, and are afterwards developed, much in the fame manner as the fungus ex pede equino grows upon the hoofs of dead horses.

It may appear aftonishing, that the clavaria should attach itself so constantly to the nymphe, of the cicadæ in America, as it is not observed to do so in other countries. For this Mr Fourgeroux attempts to account, from viewing the clavaria as a parafite peculiar to this species of insect; from the great number of the nymphæ of cicadæ which abound in America; and from the circumstances of the chimate and foil, which may render this phenomenon very common there, al-

though it be not observed in Europe. INSECTS blown from the Nofe. Of this we are fur-

nished with many accounts in the works of medical authors. The fact is confirmed by Dr Monro 1; who Ed. Med. has received at different times some of these insects Com. ii. 312. from different perfons. They were all of the scolopendra kind, though not exactly answering to any description of Linnæus. One of these he received from Mr Hill furgeon in Dumfries. It was an inch and a half long; and lived fome hours after it was discharged, creeping about flowly on a table. It was then put into ardent spirits, soon after which it died.

Noxious INSECTS; Means of destroying them, or pre- Infects. venting their Increase The following remedies we find collected in the Gentleman's Magazine for October 1790 .- Of those substances which have been generally observed to be efficacious in driving away or in destroying infects, mercury, and its various preparations, may be reekoned one of the most generally useful. Sulphur is also useful. Oils of all kinds have been often and defervedly recommended. Tobacco is not less remarkable for its utility. Of the application of thefe in order.

1. Mercury is known to kill or drive away lice from the human body; and it may probably be of equal efficacy in ridding other animals of their infects. For instance, sheep having a small quantity of mercurial ointment rubbed on their fitins, on the fides, between the fore-legs and the body, it may kill or drive away the infect peculiar to them. Sulphur is recommended to be added to the mercurial ointment. Thus not only the infect peculiar to them, but also the scab; may be cured: See the Transactions of the Society for the Encouragement of Arts, London. Vol. VIII. VIII. p. go. In the Transactions of the same Society, Vol. V. VI. p. 59. Mr Ailway directed that, in the winter, the walis, frames, &c. of his green and hot houses should be well washed with the following mixture: Take of corrosive fublimate mercury four ownces, and diffolve it in two gallons of water. These houses had been greatly infelted with red-spiders and ants. After having been washed with the above mixture, neither were to be seen . next fummer. This wash may be used on old garden walls, and to the roots of fruit-trees infetted with infects, if made weaker. . It may deftroy the tender leaves of plants, though not the roots. This wash: will effectually destroy that disagreeable infect the bug, and all other infects of a tender cuticle; and it will not in the least hurt the colour of bed furniture or hangings. . Care must be taken, that the wash be applied into every crevice or folding of the furniture with . a painter's brush. It will sometimes be necessary to repeat the wash, as some of the ova of bugs may remain concealed, notwithstanding the utmost care.

Some of the West India islands were much infested with large ants, which greatly hurt the furar-canes, The remedy was, to diffolve corrofive fublimate mercury in rum, in the proportion of two drams to a pint of spirits. This solution was poured on dry powdered fugar; and when the fugar was dried, it was laid in the paths of the ants. They eat it, and were deftroyed. Might not this practice be imitated, by laying fugar thus prepared on paper or pieces of thin boards near the roots of fruit-trees infelled by infects, especially when the fruit is ripening? The papers or boards might be taken in during the night, or when it rained. The fugar should be coloured with indigo, or other substance, thereby to mark it as a substance to be a-

voided by curious idlers.

2. We are informed that a person in Philadelphia employed brimftone in the following manner. Having cleared all round the roots of trees infested with caters pillars or other infects, he frewed fome flour of brimstone round the roots, and covered it with a thin fprinkling of fine mould, that it might not be blown away by the wind, yet fo that the fun might operate through, and cause the brimstone to fumigate. he destroyed the caterpillars. One pound he found

Infects, fufficient for 200 trees. In that hot climate the fun without hurting the leaves. This composition may be got Infects.

may perhaps have that effect; but it fcarcely will in this. He also employed sulphur in the following manner to drive infects from tall trees. He split the end of a pole, and put in the flit fome matches, fet them on fire, and held them under the parts of the trees chiefly affected A pole thus armed, he found, would answer for three or four trees. Brimstone thus mixed with damp straw, and fet on fire, for instance, in hopground infested with the fly, might be of use to drive away the fly.

The itch is supposed to proceed from a very small infect which neftles under the skin, and proceeds no farther into the habit; and is therefore attended with no dangerous confequences. Brimstone made into an

ointment with hogs lard is a fure remedy.

Sheep are liable to an emption on the skin, known by the name of the scab. The bringtone, when added to the mercurial ointment recommended for that dilorder in the Transactions of the Society for the Encouragement of Arts, Vol. VII. p. 90, might perhaps render the application more efficacious and less danger-

3. The natives of hot countries are taught by experience, that an uncluous covering on their bodies prevents the bites of mulquitoes and all gnats. The white inhabitants in fuch countries are not fufficiently careful in preventing the least stagmant water near their dwellings, in which the mufquitoes are bred; even in the wafte water thrown out they are produced. Dr Franklin, by a careful attention to this circumstance, guarded his family in Philadelphia from fuch infects: one day feeing a number of musquitoes in his library, he found on inquiry, that one of his fervants had taken the cover off a tub placed near his window for receiving rain-water. On fuch an occasion the remedy is eafy, viz. shutting the room up for the day, fo that the mufquitoes cannot come at any water, in which time they die. Though this caution may feem trifling to us who live in a mild climate, it is far otherwife in hot countries.

Oils being known to be most efficacious in destroying infects, may not the use of it be extended to the destruction of worms in the bowels of horses, where they may occasion the violent pain they feem fometimes to fuffer? If the horse was for some time kept fasting, and a large quantity of oil, suppose a pint, was given, if worms are the cause, the oil may in that

Flowers, leaves, and fruit, on plants, are known to be devoured by caterpillars. These are destroyed by oils, which close the lateral pores by which they breathe. For this purpose it is advised, that, on the approach of spring, a cloth dipped in train oil be laid on fuch parts of the tree in which there is the leaft

appearance of them.

We are informed, in the Memoirs of the Society of Agriculture at Paris, that oil of turpentine, when applied to animals which were covered with infects, destroyed the infects without hurting the animal. The author tried it on feveral trees, mixed with fine earth fo as to incorporate them well, then adding water, ftill flirring them carefully till the whole was brought to some degree of fluidity. In this mixture he dipped branches of fruit-trees on which there were infects, and

off by washing, or the first heavy shower. From these experiments the author thinks, that oil of turpentine may with equal officary be employed for hilling -rious kinds of lice on domestic animals.

We are informed, in the Transactions of the Society for the Encouragement of Arts, Vol. V. p. 45, that Mr Winter, among other experiments on turnip feed. fleeped the feed 24 hours in a fufficient quantity of train oil. He then drained the oil from the feed. which he mixed with a quantity of fine fifted earth, and immediately fowed it in drills. When the plants began to appear on the furface, the ground was fown with foot. He found that feed fleeped in lintfeed oil answered equally well. The turnips the least injured by the fly were those that grew from feed fleeped as above, which grew fo luxuriantly as to produce rough leaves feveral days prior to the most flourishing of any of his other experiments, and were the better enabled to withfland the fly's attack. The leaves of thefe turnips were of a darker green, and appeared twice as thick in bulk and luxuriancy than the other turnips. and were a confiderable deal larger. The feed was drilled an inch and a half deep, and at a foot distance in the rows. Train oil is apt to kill the leaves of plants which have been injured by infects, but lintfeed oil has not that effect, though equally destructive to the infects. The train oil feems to act both as an oil, and by its difagreeable fmell it prevents infects approaching it. In this respect it may be successfully used to prevent field-mice or other vermin preying on acorns, chefnuts, or other feeds fleeped in it before they are fown.

When thus giving directions for preventing the fly on turnips, a late experiment should be mentioned, by the difclofing of which a perfon gained a confiderable reward. His fecret was, running a roller over the ground early in the morning, while the dew remained on the ground, on the first appearance of the fly. The dew entangled the flies fo much, that they could not make their escape, and were therefore crushed to death. As the roller may leave the furface of the earth too hard, fome very properly advife to fix fome boughs of elder in a gate or hurdle, to be drawn over the field a and if the boughs had been before fumigated with the fmoke of tobacco, or tincture of afafeetida, the fuccess would be the furer. The most certain method of preventing the hurt done by the fly is to raife the plants in a nursery, and at a proper age to transplant them, being carried to the ground in a wheelbarrow filled with manure foftened with water fo as to admit the plants. This method will fecure their more fpeedy growth. In the nursery the attack of the fly may be prevented by sprinkling foot or quicklime on the ground. The utility of transplanting turnips is evident by the practice of transplanting the turnip-rooted cabbage. They who are discouraged from this practice by the expence attending it, do not reflect that the hoeing is prevented, and the plants grow the better, being fet in fresh earth.

4. Before proceeding to direct the use of the last means mentioned, viz. tobacco, for defroying infects in tur-'nips, it may be proper to mention an experiment made by Mr Green, of her majefly's flower-garden at Kew. He contrived a pair of bellows, fimilar to that employhereby destroyed not only the eggs but also the infects, ed in recovering people feemingly drowned. It has a

cavity

Infects, cavity in the nozzle, in which fome tobacco is put, ftorms of rain, and therefore the infusion must be Infects. with a live coal over it. The bellows being then worked, the tobacco is fet on fire, and the fmoke is sincard to any postionine spots A lady was fond of having the mosk-rose in her dressing-room, but was prevented having it on account of the green infects which conflantly adhere to that plant. To remedy this inconvenience, Mr Green had a box made large enough to contain a pot in which a plant of the moskrose grew. In one end of the box was a hole, to admit the nozzle of the bellows; the bellows was worked, and the smoke was received into the box. When the tobacco was confumed, the nozzle was withdrawn, and a cork being put into the hole, the box thus remained till morning, when the infects were all laid dead on the earth. Being swept off, the plant was in a flate fit for a dreffing room. Many plants thus in-fested with insects may be too large, or otherwise so placed as not to be put into a box. In this case it occurred to the writer of these observations, that being fprinkled with an infusion of tobacco in water might in some degree answer the same purpose. On

trial he found it answer, and he thus freed other plants

of their infects. He also used it on trees of easy access with advantage. Train oil is so inimical to tender

plants or leaves, that it destroys them if infects have

in the least hurt them ; whereas the infusion, instead of killing the leaves, promoted a fresh vegetation.

Fruit trees often become the prey of infects. Those against a wall, or in espaliers, being easily come at, much of the mischief may be prevented by cutting off the leaves fo foon as they are observed to be curled; for then fresh eggs are laid on them, probably by butterflies. If fprinkled with the infusion of tobacco, it will prevent their coming to life. After the fruit is formed, the infusion must not be used, lest the taste and fmell may remain. The feiffars are then the proper remedies, which ladies may employ as amusement, and may thereby present fruit to their friends of their own preferving. A lye of the ash of plants sprinkled on the leaves may have a good effect, as also on other pot-herbs, which are often the prey of caterpillars. As many infects, befides those bred on the leaves or in the walls, may destroy the fruit, the fugar with the corrofive fublimate, as already described, may be laid in the way of other infects, to all which it will prove a speedy death. Diligent inspection into their retreats is the most certain means of preventing the loss suftained by fnails. Ants are prevented rifing up the trees, by laying round the roots powdered chalk, or any other fubflance which by entangling their feet prevents their croffing it. Care should be taken to defirey their nests every where near the garden.

Hops are now become an article of fo great confequence, that it deserves our particular attention. Early in its growth, when the vines begin to afcend the poles, a black fly preys on its leaves, frequently in fuch numbers, as, by destroying the leaves, to interrupt the vegetation, much of the food of plants being absorbed by the leaves. The infusion of tobacco destroys them, or at least drives them away so effectually, that a plant almost totally stripped of its leaves has put out fresh leaves after the use of it. If care be not taken, they will again fall on the fresh leaves. As the slies lodge on the lower fide of the leaves, they are protected from Nº 167 ..

driven upwards by a forcing pump. As it is faid that the expence of tobacco is too great, perhaps lime-water, or even water by itself, driven strongly against the leaves, might drive them away. The labour attending fuch experiments in a large plantation discourages others, without reflecting that, if fuch means are used early, the flies may more easily be got rid of. Free ventilation is undoubtedly beneficial to all plants: and hence perhaps the particular advantages of drilling corn in rows a little diftant. If alleys fomewhat larger than common were made in the plantations of hops, there might be fufficient spaces left where the alleys cross one another to admit of fetting damp straw, or other materials mixed with brimftone, foot, &c. on fire. Smoke itself is said to prevent the Arr, and if so, it will ftill act more powerfully when mixed with such materials. It has been observed in Sweden, that the hops grow naturally among heaps of stones or fragments of rocks. They therefore advise to cover the ground round their roots with flones, which will prevent the infects laying their eggs near the roots in the ground, where they lay them to be protected during the winter. The stones will also preserve moisture at the roots during the fummer. A rope cannot be drawn across a plantation of hops, as it can across a field of corn, in case of mildew. Here water to wash off the clammy juice that entices and feeds infects feems to be the only remedy. The plantation being well ventilated, may at least prevent the frequency of it. The forcing pump will most effectually wash off this exudation.

Cruelty to INSECTS. It does not appear upon what principle of reason and justice it is, that mankind have founded their right over the lives of every creature that is placed in a fubordinate rank of being to themselves. Whatever claim they may have in right of food and felf-defence (to which ought we to add the purpofes of the naturalist, explained above?) did they extend their privilege no farther than those articles would reafonably carry them, numberless beings might enjoytheir lives in peace, who are now hurried out of them by the most wanton and unnecessary cruelties. It is furely difficult to discover why it should be thoughtless inhuman to crush to death a harmless insect, whose fingle offence is that he eats that food which nature has prepared for his fustenance, than it would be were we to kill any bulky creature for the same reason. There are few tempers fo hardened to the impressions of humanity, as not to shudder at the thought of the latter; and yet the former is univerfally practifed without the least check of compassion. This seems to arise from the gross error of supposing, that every creature is really in itself contemptible, which happens to be clothed with a body infinitely disproportionate to our own, not confidering that great and little are merely: relative terms. But the inimitable Shakespeare would teach us, that

the poor beetle that we tread upon, In corp'ral fuff'rance, feels a pang as great As when a giant dies .-

And indeed there is every reason to believe that the fensations of many insects are as exquisite as those of creatures of far more enlarged dimensions, perhaps even more fo. The millepede, for inftance, rolls itself Infolvent.

in her horns upon the least approach of our hand. Are these, is faid to die insolvent. not these the strongest indications of their sensibility? and is it any evidence of ours, that we are not therefore induced to treat them with a more sympathising tenderness?

kindness and benevolence which every species of creain tormenting flies, &c. is a mark of any innate cruelon other principles; and it is entertaining unworthy notions of the Deity, to Suppose he forms mankind never would have learned from nature, and grow up inbut their own. Accordingly the supreme court of jubelow its cognizance, and punished a boy for putting out the eyes of a poor bird that had unhappily fallen into his hands.

order to awaken as early as possible in children an extensive sense of humanity, to give them a view of seaffiftance of glaffes, and to show them that the same formation of the minutest infect, as in that of the most enormous leviathan: that they are equally furnished with whatever is necessary, not only to the preserva- conduct of any work is committed. tion, but the happiness of their beings in that class of existence to which Providence has assigned them : in a word, that the whole construction of their respective organs diffinctly proclaims them the objects of the divine benevolence, and therefore that they juftly ought

INSI RTION, in anatomy, the close conjunction of the veffels, tendons, fibres, and membranes of the body with fome other parts.

INSINUAT ON denotes a cunning and covert way of creeping into any perfon's favour.

INSINUATION of a Will, among Civilians, is the first production of it, or the leaving it with the register, in

order to its probate. See WILL. INSIPID, TASTFLESS, that which has nothing in

it pungent enough to affect the palate, tongue, &c. and to occasion that fensation we call tasting. INSITION, INSITIO, in botany, denotes the fame

with engrafting; viz. the act of inferting and uniting a cyon, bud, or the like, in the fubstance of the stock.

INSOLATION, in pharmacy, a method of preparing certain fruits, drugs, &c. by exposing them to the heat of the fun's rays; either to dry, to maturate, or to sharpen them; as is done in vinegar, figs, &c .- The word comes from the Latin verb infolare, which is used by Pliny and Columella, and fignifies to a direction of the Holy Spirit, which never permitted expose to the fun.

INSOLVENT, a term applied to fuch persons as have not wherewithal to pay their just debts. A per- Holy Spirit regards only the matter, not the style or Vol. IX. Part I.

Infects round upon the flightest touch, and the Inail gathers fon dying, and not leaving estate sufficient to discharge Inspection

Trial by INSPECTION, or Examination, is Inspiration. when, for the greater expedition of a caufe, in some point or iffue, being either the principal question, or arifing collaterally out of it, but being evidently the Montaigne remarks, that there is a certain claim of .object of fense, the judges of the court, upon the teflimony of their own fenfes, shall decide the point in tures has a right to from us. It is to be regretted that dispute. For, where the affirmative or negative of a this general maxim is not more attended to in the affair question is matter of such obvious determination, it is of education, and preffed home upon tender minds in not thought necessary to fummon a jury to decide it : its full extent and latitude. We are far, indeed, from who are properly called in to inform the confcience of thinking, that the early delight which children discover the court of dubious facts: and therefore, when the fact, from its nature, must be evident to the court eity of temper, because this turn may be accounted for ther from ocular demonstration or other irrefragable proof, there the law departs from its usual refort, the verdict of 12 men, and relies on the judgment of the with a propenfity to the most detestable of all disposis court alone. As in case of a fuit to reverse a fine for tions: but most certainly by being unrestrained in sports non-age of the cognizor, or to set aside a statute or reof this kind, they may acquire by habit, what they cognizance entered into by an infant; here, and in other cases of the like fort, a writ shall issue to the to a confirmed inattention to every kind of fuffering fheriff, commanding him that he confirmin the faid party to appear, that it may be afcertained by the view dicature at Athens thought an inftance of this fort not of his body by the king's justices, whether he be of full age or not : Ut per aspectum corporis sui constare poterit justiciariis nostris, si prædictus an sit plenæ atatis necne. If, however, the court has, upon inspection, any doubt It might be of fervice, therefore, it should feem, in of the age of the party (as may frequently be the case), it may proceed to take proofs of the part ; and particularly may examine the infant himfelf upon an veral forts of infects as they may be magnified by the oath of voir dire, veritatem dicere; that is, to make true answers to such questions as the court shall demand evident marks of wildom and goodness prevail in the of him : or the court may examine his mother, his godfather, or the like.

INSPECTOR, a perfon to whom the care and

INSPECTORS, in the Roman law, were fuch perfons as examined the quality and value of lands and effects. in order to the adjusting or proportioning taxes and impositions to every man's estate.

The Jews also have an officer, in their fynagogue, whom they call inspector, no bhazen. His business confifts principally in inspecting or overlooking the prayers and leffons, in preparing and showing them to the reader, and in flanding by him to fee he reads right; and, if he makes mistakes, he is to correct him.

INSPIRATION, among divines, &c. implies the conveying of certain extraordinary and superparural notices or motions into the foul, or it denotes any fupernatural influence of God upon the mind of a rational creature, whereby he is formed to any degree of intellectual improvements, to which he could not, or would not, in fact have attained in his prefent circumstances in a natural way. Thus the prophets are faid to have fpoken by divine infpiration.

Some authors reduce the infpiration of the facred writers to a particular care of Providence, which prevented any thing they had faid from failing or coming to nought; maintaining, that they never were really inspired either with knowledge or expression.

According to M. Simon, inspiration is no more than the facred writers to be mistaken.

It is a common opinion, that the infpiration of the Kk words : Infpiration words; and this feems to fall in with M. Simon's doctrine of direction.

Theological writers have enumerated feveral kinds of inspiration: such as an inspiration of superintendency, in which God does fo influence and direct the mind of any person, as to keep him more secure from error in some various and complex discourse, than he would have been merely by the use of his natural faculties: plenary fuperintendent inspiration, which excludes any mixture of error at all from the performance fo superintended; inspiration of elevation, where the faculties act in a regular, and, as it feems, in a com-mon manner, yet are raifed to an extraordinary degree, fo that the composure shall, upon the whole, have more of the true fublime or pathetic, than natural genius could have given; and inspiration of suggestion, when the use of the faculties is superfeded, and God does, as it were, fpeak directly to the mind, making fuch discoveries to it as it could not otherwise have obtained, and dictating the very words in which fuch difcoveries are to be communicated, if they are defigned as a meffage to others. It is generally allowed that the New Testament was written by a superintendent inspiration; for without this the difcourfes and doctrines of Christ could not have been faithfully recorded by the evangelists and apostles; nor could they have affumed the authority of fpeaking the words of Christ, and evinced this authority by the actual exercise of miraculous powers: and befides, the facred writings bear many obvious internal marks of their divine original, in the excellence of their doctrines, the fpirituality and elevation of their defign, the majefty and fimplicity of their ftyle, the agreement of their various parts, and their efficacy on mankind; to which may be added, that there has been in the Christian church, from its earliest ages, a constant tradition, that the facred books were written by the extraordinary affiftance of the spirit, which must at least amount to superintendent inspiration. But it has been controverted whether this infpiration extended to every minute circumstance in their writings, fo as to be in the most abfolute fense plenary. Jerom, Grotius, Erasmus, Epifcopius, and many others, maintain that it was not; whilft others contend, that the emphatical manner in which our Lord fpeaks of the agency of the spirit upon them, and in which they themselves fpeak of their own writings, will justify our believing that their inspiration was plenary, unless there be very convincing evidence brought on the other fide to prove that it was not: and if we allow, it is faid, that there were fome errors in the New Testament, as it came from the hands of the apostles, there may be great danger of subverting the main purpose and defign of it : fince there will be endless room to debate the importance both of facts and doctrines.

Among the Heathens, the priefts and prieftesses were faid to be divinely infpired, when they gave oracles.—The poets also laid claim to it; and to this end they always invoked Apollo and the Muses at the

beginning of any great work.

INSPIRATION, in physic, is understood of that action of the breast, by which the air is admitted within the lungs; in which fence, inspiration is a branch of respiration, and stands opposed to Exermation.

This admission of the air depends immediately on infisition its spring or elasticity, at the time when the cavity of the breast is enlarged by the elevation of the tho rax and abdomen, and particularly by the motion of the diaphragm downwards: so that the air does not enter the lungs, because they are dilated; but those dilates, because they are dilated; but those dilates, because they are dilated; but those is it the dilatation of the breast which draws in the air, as is commonly thought, though this is a condition absolutely necessary to inspiration; but an actual intrusion of the air into the lungs. See Respirations

INSPISSATING, in pharmacy, an operation whereby a liquor is brought to a thicker confidence.

by evaporating the thicker parts.

INSPRUCK, a city of Germany, in the circle of Austria, and capital of the county of Tyrol, received its name from the river Inn, which runs by it. It has a noble castle or palace, formerly the residence of the archdukes of the house of Austria, with a cathedral where they are buried. The houses, though built in the German taste, are rather handsomer; and the fireets, though narrow, are remarkably well paved. For the defence of this city the inhabitants can place but little confidence in their fortifications, which are very trifling. They feem rather to depend on the natural fastnesses of their country; which appear indeed to form a barrier, so perfectly inaccessible to any encmy, that even the great Gustavus Adolphus, after having over-run with his victorious arms the other parts of Germany, could never make any impression upon this. It is feated in a pleafant valley, in E. Long. 11. 27. N. Lat. 47. 3.

INSTALLATION, the act of giving vilible poffeffion of an order, rank, or office, by placing in the

proper feat. See INSTALMENT.

INSTALMENT, a fettling or inflating any perfon in a dignity. The word is derived from the Latin in, and fallium, a term used for a feat in church, in the choir, or a seat or bench in a court of justice, &c. Though Vossius is of opinion the word is of German

INSTALMENT is chiefly used for the induction of a dean, prebendary, or other ecclesialtical dignitary, into the possession of his stall, or proper seat, in the cathedral church to which he belongs. This is some-

times also called inflallation.

INSTALMENT is likewife used for the ceremony, whereby the knights of the garter are placed in their rank, in the chapel of St George at Windsor.

INSTANT, a part of duration in which we perceive no fucceffion; or it is that which takes up the

time only of one idea in our minds.

INSTAURATION, the re-effablishment, or reflauration of a religion, a church, or the like, to its former flate. The word is by some derived from the old Latin inflaurum, which figuined the "flock" of things necessary for the tilling and managing of grounds; as cattle, tools, harnels, &c. But the word inflaurum is only of the middle age: inflauratio is of much greater antiquity, and by some derived from inflar, "like", "a simporting a thing's being brought to its former likeness or appearance. See Restau-RATION.

INSTEP, in the manege, is that part of a horfe's

ning

Definition

Inftinct. hind leg, which reaches from the ham to the paftern-

INSTINCT, a certain power or disposition of mind, by which, independent of all inftruction or experience, without deliberation, and without having any end in view, animals are unerringly directed to do spontaneoully (A) whatever is necessary for the preservation of the individual or the continuation of the kind. Such in the human species is the inflinct of sucking exerted immediately after birth; and fuch in the inferior creation is the inftinct by which infects invariably deposit their eggs in fituations most favourable for hatching and affording nourishment to their future progeny. These operations are necessary for the preservation of the individual and the continuation of the kind; but neither the infant nor the infect knows that they are neceffary; they both act without having any end in view, and act uniformly without instruction and without experience.

The actions of the inferior animals are generally directed by inflinct ; those of man by reason. This at leaft is the case with respect to men in a state of civilization: in the favage state they are probably little less the flaves of instinct than the brutes themselves. Concerning buman inftincts, indeed, philosophers differ widely in opinion; fome maintaining that man is endowed with a greater number of inftincts than any species of brutes; whilft others deny that in human nature there is any power or propenfity at all which can pro-

perly be called inflinctive.

This diversity of opinion may easily be traced to its fource. There are not many original thinkers in the world. The greater part even of those who are called philosophers, implicitly adopt the opinions of certain matters whose authority they deem sufficient to supply the place of argument; and having chosen their refpective guides, each maintains with zeal what his mafter taught, or is supposed to have taught. When Locke fo successfully attacked the doctrine of innate ideas and innate principles of speculative truth, he was thought by many to have overturned at the fame time all innate principles whatever; to have divefted the human mind of every passion, affection, and instinct; and to have left in it nothing but the powers of fenfation, memory, and intellect. Such, we are perfuaded, was not his intention; nor is there any thing in his immortal work which, when interpreted with candour, appears to have fuch a tendency.

In our opinion, great part of the Effay on Human Understanding has been very generally mifunderstood. Much of its merit, however, was foon discovered; and mankind, finding philosophy disencumbered of the bar-

barous jargon of the schools, and built upon a few felf- Infline evident principles, implicitly embraced every opinion advanced, or which they fupposed to be advanced, by the illustrious author; especially if that opinion was contrary to any part of the scholastic system which had so long been employed to perplex the understanding and to veil abfurdity. Hence arose many philofophers of eminence both at home and abroad; who maintained, as they imagined, upon the principles of Locke, that in the human mind there are no instincts. but that every thing which had been usually called by that name is refolvable into affociation and habit. This doctrine was attacked by Lord Shaftefbury, who introduced into the theory of mind, as faculties derived from nature, a fenfe of beauty, a fenfe of honour, and a fense of ridicule; and these he considered as the tells of speculative truth and moral rectitude. His lordship's principles were in part adopted by Mr Hutchifon of Glafgow, who published a fystem of moral philosophy, founded upon a fense or inftinct, to which he gave the name of the moral fense; and the undoubted merit of his work procured him many followers.

Men generally run from one extreme to another. It being now discovered, or at least supposed, that the human mind is endowed with inftinctive principles of action, a fect of philosophers foon afterwards arose, who maintained with much vehemence that it is likewife endowed with inftinctive principles of belief; and who built a fystem of metaphysics, if such it may be called, upon a number of innate, diffinct, and independent fenfes. The rife of this fect is well known. Berkeley and Hume had adopted Locke's doctrine respecting the origin of our ideas; and had thence deduced confequences supposed to be dangerous in themfelves, but which, it was thought, could not be denied without refusing the principles from which they were inferred. The foundation of the inflinctive fyftem being thus laid, the fystem itself was rapidly carried to a height far beyond what feems to have been the intention of its excellent author; and reason was well night banished from the regions of philosophy. For such a proceeding it is not difficult to affign the cause. The inflinctive scheme requires much less labour of investigation than the fystems of Locke and the ancients; for upon the principles of it, when carried to its utmost extent, every phenomenon in human nature is thought to be fufficiently accounted for, by fuppofing it the effect of a particular instinct implanted in the mind for that very purpole. Hence in fome popular works of philosophy we have a detail of so many diflinct internal fenfes, that it requires no small strength of memory to retain their very names: befides the mo-

Different man in

⁽A) As nothing is of greater importance in the philosophy of mind than accurate definitions, it may not be improper to observe, that through the whole of this article the word Spontaneous is to be taken in the sense in which it is used in the following extracts from Hales's Origin of Mankind: "Many analogical motions in animals, though I cannot call them voluntary, yet I fee them fpontaneous: I have reason to conclude, that these are not fimply mechanical." "The fagacities and inftincts of brutes, the fpontaneoufnefs of many of their motions, are not explicable, without supposing some active determinate power connected to and inherent in their spirits, of a higher extraction than the bare natural modification of matter." If this be attended to, our definition of instinct will be found perfectly confonant to that which has been given by the author of Ancient Metaphyfies. "Inflinet (he fays) is a determination given by Almighty Wifdom to the mind of the brute, to act, in fuch or fuch a way, upon fuch or fuch an occasion, without intelligence, without knowledge of good or ill. and without knowing for what end or purpose he acts."

Inflinct. rat fenfe, we have the fenfe of beauty, the fenfe of deformity, the fense of bonour, the boarding fense, and a thousand others which it is needless here to mention.

This new fystem, which converts the philosophy of mind into mere hiftory, or rather into a collection of facts and anecdotes, though it has made a rapid progress, is not yet universally received. It has been opposed by many speculative men, and by none with greater skill than Dr Priestley; who maintains, with the earliest admirers of Locke, that we have from nature no innate fense of truth, nor any inflinctive principle of action; that even the action of fucking in new-born infants is to be accounted for upon principles of mechanism; and that the defire of the sexes is merely affociation.

Inflinct

Whilst men, eminent for candour as well as for confounded science, have thus been disputing the limits between with reason instinct and reason in the human mind, and endeavourmechanism ing to ascertain the actions which result from each. two writers of name, treating of that subject, have lately advanced opinions, which, if admitted as just, must render the dispute henceforth ridiculous, and put an end for ever to all moral inquiries. Mr Smellie, in a work which he calls The Philosophy of Natural History, affirms, that between inflinctive and rational motives no diffinction exilts, but that the reasoning faculty itself is the necessary result of instinct; and Dr Reid, in his Essays on the Allive Powers of Man, by attributing to instinct the action of breathing, seems to confound that principle with mere mechanism.

Thefe three principles accurately diftinguish ed from

That reason, instinct, and mechanism, are all essentially different from one another, has hitherto been uni verfally allowed; and it appears not to be a talk of much difficulty to point out in what respect each of each other, them differs from the other two. Actions performed with a view to accomplish a certain end are called rational actions, and the end in view is the motive to their performance. Inflinctive actions have a cause, viz. the internal impulte by which they are spontaneously performed ; but they cannot be faid to have a motive, because they are not done with any view to consequences. Actions automatic have likewise a cause; but that cause is not internal impulse, but mere mechanism, by which they are performed without any spontaneity of the agent. Thus, a man gives charity in order to relieve a person from want; he persorms a grateful action as

a duty incumbent on him; and he fights for his coun- Inflinet. try in order to repel its enemies. Each of these actions is performed from a motive, and therefore they are all rational actions. An infant is impelled to fuck the break, but he knows not that it is necessary for his prefervation; a couple of young favages go together, for the first time, without any view to offspring or any determinate idea of enjoyment. These actions have no motive, and therefore are not rational: but as they are performed by a Spontaneous exertion of the agents, they are not to be attributed to mere mechanisin; they are therefore instinctive actions. A man breathes without any motive, without any fpontaneous exertion of his own, and that as well when he is afleep as when he is awake. The action of breathing therefore is neither rational nor inflinctive, but merely automatic or mechanical. All this feems to be very plain. To talk of the motives of actions performed by initinct, in an argument intended to prove that between reason and intlinet there is no difference, is either to beg the question or to pervert language. If the author of the Philosophy of Natural Hittory chooses to call the impulse which promps the infant to fuck by the name of motive, he only uses an English word improperly; if it be his intention to affirm that fuch a motive is not totally and effentially different from that which prompts a man to give charity or to fight for his country, he affirms what all mankind know to be falfe (B).

Having thus afcertained what we mean by inftinct. we shall now proceed to inquire, Whether or not there be any inftinctive principles in man? But in order to proceed upon fure grounds, it will be proper to confider, in the first place, fuch actions of the inferior animals as are generally allowed to be intlinctive: for an attempt has lately been made to prove, that even these actions are the offspring of reason influenced by motives; and that inflinet, as we have defined it, is a mere imaginary principle, which has no existence either

in man or brute.

It has been faid that caterpillars, when shaken off a instances tree in every direction, initantly turn round towards of i flind the trunk and climb up, though they had never for- in animals. merly been on the furface of the ground. This is a striking instance of instinct. On the tree, and not upon the ground, the caterpillar finds its food. If

therefore it did not turn and climb up the trunk, it would

"Another material difference in practice betwixt the animal and intellectual mind is, that every action of intellect proceeds from an opinion formed concerning what is good or ill, beautiful or the contrary, in the action. When we do fo, we are faid to act from will, which is always determined by some opinion formed of the kind I have mentioned: whereas, when we act from mere appetite or inclination, without deliberation or opinion formed, we act as the brute does always; for he has no will, but is prompted to action by natural

impulse, or opan, as the Greeks call it.

"A third very marerial difference is, that intellect, in all its operations, proposes ends, and devises means to accomplish these ends; whereas the instinct of the brute proceeds without consideration either of ends or means.

⁽B) The author of Ancient Metaphylics, whose learned work contains more good sense on this subject than any other book which we have feen, thus diftinguishes between reason and inftinct: "With respect to the mere animal, it is evident that he purfues nothing but what is conducive either to the prefervation of the animal life or to the continuation of the kind. On the other hand, the object which the intellectual mind purfues, is the fair and the hand/ome; and its happiness confifts in the contemplation of these. And though it purfue also what is ufeful and profuable for the being and well-being of the animal life, yet it is for the fake, But of the animal life ittelf, but of the To xahor or beautiful; which therefore is the ultimate object of its pursuit in all things.

Inftinct. would inevitably perifh: but furely the caterpillar knows not that fuch an exertion is necessary to its preservation; and therefore it acts not from motives. but from blind impulse. The bee and the beaver are endowed with an inflinct which has the appearance of forefight. They build magazines, and fill them with provisions; but the forefight is not theirs. Neither bees nor beavers know any thing of futurity. The folitary wasp digs holes in the sand, in each of which the deposits an egg. Though she certainly knows not that an animal is to proceed from that egg, and flill less if possible that this animal must be nourished with other animals, the collects a few fmall green worms, which she rolls up in a circular form, and fixes in the hole in fuch a manner that they cannot move. When the wasp-worm is hatched, it is amply stored with the food which nature has destined for its support. The green worms are devoured in fuccession; and the number deposited is exactly proportioned to the time neceffary for the growth and transformation of the waspworm into a fly; when it iffues from the hole, and is capable of procuring its own nourishment. This inflinct of the parent wasp is the more remarkable, that the feeds not upon flesh herfelf. Birds of the same species, unless when restrained by peculiar circumstances, uniformly build their nefts of the fame materials. and in the fame form and fituation, though they inhabit very different climates; and the form and fituation are always exactly fuited to their nature, and calculated to afford them shelter and protection. When danger, or any other circumstance peculiar to certain countries, renders a deviation from the common form or fituation of nefts necessary, that deviation is made in an equal degree, and in the very fame manner, by all the birds of one species; and it is never found to extend beyon! the limits of the country where alone it can ferve any good purpofe. When removed by necessity from their eggs, birds return to them with haite and anxiety, and shift them so as to heat them equally; and it is worthy of observation, that their hafte to return is always in proportion to the cold of the climate. But do birds reason, and all of the same fpecies reason equally well, upon the nature and extent of danger, and upon the means by which it can best be avoided? Have birds any notion of equality, or do they know that heat is necessary for incubation? No; in all these operations men recognise the intentions of nature; but they are hid from the animals themselves, and therefore cannot operate upon them as motives.

Of the inftinct of animals we shall give one instance more in the elegant and perspicuous language of Dr Reid. " Every manufacturing art among men (fays that able write) was invented by fome man, improved by others, and brought to perfection by time and experience. Men learn to work in it by long practice, which produces a habit. The arts of men vary in every age and in every nation, and are found only in those men who have been taught them. The manufactures of animals differ from those of men in many striking particulars. No animal of the species can claim the invention; no animal ever introduced any new improvement, or any variation from the former practice: every one of the species has equal skill from the beginning, without teaching, without experience, and

without habit; every one has its art by a kind of in- Infline. fpiration. I do not mean that it is inspired with the principles or rules of the art, but with the ability of working in it to perfection, without any knowledge of its principles, rules, or end. The work of every animal is indeed like the works of nature, perfect in its kind, and can bear the most critical examination of the mechanic or the mathematician, of which a honeycomb is a striking in tance.

"Bees, it is well known, construct their combs with Remarks fmall cells on both fides, fit both for holding their flore able inof honey and for rearing their young. There are stance in only three possible figures of the cells, which can make the bee, them all equal and fimilar, without any ufeless interflices. These are the equilateral triangle, the square, and the regular hexagon. Of the three, the hexagon is the most proper, both for convenience and strength. Bees, as if they knew this, make their cells regular hexagons. As the combs have cells on both fides, the cells may either be exactly opposite, having partition . against partition, or the bottom of a cell may rest upon the partitions between the cells on the other fide. which will ferve as a buttrets to ftrengthen it. The last way is the best for strength; accordingly the bottom of each cell reits against the point where three partitions meet on the other fide, which gives it all the thrength possible. The bottom of a cell may either be one plane, perpendicular to the fide partitions: or it may be composed of several planes, meeting in a folid angle in the middle point. It is only in one of thefe two ways that all the cells can be fimilar without lofing room. And for the fame intention, the planes, of which the bottom is composed, if there be more than one, must be three in number, and neither more nor fewer. It has been demonstrated, that by making the bottoms of the cells to confift of three planes meeting in a point, there is a faving of material and labour no way inconsiderable. The bees, as if acquainted with these principles of folid geometry, follow them most accurately; the bottom of each cell being composed of three planes, which make obtuse angles with the fide partitions and with one another, and meet in a point in the middle of the bottom; the three angles of this bottom being supported by three partitions on the other fide of the comb, and the point of it by the common interfection of these three partitions. One instance more of the mathematical skill displayed in the structure of a honey-comb deferves to be mentioned It is a curious mathematical problem, as what precise angle the three planes which compose the bottom of a cell ought to meet, in order to make the greatest possible faving of material and labour. This is one of those problems belonging to the higher parts of mathematics, which are called problems of maxima and minima. The celebrated M. Laurin resolved it by a fluxionary calculation, which is to be found in the Transactions of the Royal Society of London, and determined precifely the angle required. Upon the most exact mensuration which the subject could admit. he afterwards found, that it is, the very angle in which the three planes in the bottom of the cell of a honevcomb do actually meet.

" Shall we ask here, Who taught the bees the properties of folids, and to refolve problems of maxima and minima? If a honey-comb were a work of human art.

every man of common fense would conclude, without hesitation, that he who invented the construction must have understood the principles on which it was conflructed. We need not fay that bees know none of thefe things. They work most geometrically without any knowledge of geometry; fomewhat like a child, who by turning the handle of an organ makes good mufic without any knowledge of mufic. The art is not in the child, but in him who made the organ. In like manner, when a bee makes its combs fo geometrically, the geometry is not in the bee, but in that Great Geometrician who made the bee, and made all things in number, weight, and meafure."

Which canfounded with the operations of reason.

We have given a full detail of the structure of a not be con. honey-comb, because it is an effect of instinct which cannot be confounded with the operations of reason. The author of The Natural History of Animals, justly offended with that theory which treats of inflinctive motives, which represents the human mind as a bundle of inftincts, and of which the object feems to be to degrade mankind to the level of brutes, has very laudably exerted his endeavours to detect its weaknefs, and to expose it to contempt. But in avoiding one extreme, he feems to have run into the other; and whilft he maintains the rights of his own species, he almost raifes the brutes to the rank of men. " It is better (he fays) to share our rights with others than to be entirely deprived of them." This is certainly true; and no good man will hefitate to prefer his theory to that of his antagonist; but we fee no necessity for adopting either; the phenomena may be accounted for without degrading reason to the level of instinct,

or elevating inftinct to the dignity of reason.

We shall readily allow to Locke (c), that some of Instinct. the inferior animals feem to have perceptions of particular truths, and within very narrow limits the faculty Onfome ocof reason: but we see no ground to suppose that their casions the natural operations are performed with a view to con inferioranifequences; and therefore cannot perfuade ourfelves, malsreafon; with this historian of theirs, that these operations are perform the refult of a train of reasoning in the mind of the their natu-

He acknowledges indeed, that their reasoning and tions by inthinking powers are remarkably deficient when compared with those of men; that they cannot take fo full a review of the past, nor look forward with fo penetrating an eye to the future; that they do not accumulate observation upon observation, or add the experience of one generation to that of another; that their manners do not vary nor their customs fluctuate like ours : and that their arts always remain the fame, without degeneracy and without improvement. "The crow (he observes) always builds its nest in the same way; every hen treats her young with the fame meafure of affection; even the dog, the horfe, and the fagacious elephant, feem to act rather mechanically than with defign. From fuch hafty observations as thefe, it has been inferred (he fays), that the brutes are directed in their actions by fome mysterious influence, which impels them to employ their powers unintentionally in performing actions beneficial to themselves, and fuitable to their nature and circumftances."

And are these observations indeed hasty? and is this inference ill founded? To us the matter appears quite otherwife. If the arts of brutes and other animals have

(c) " For if they have any ideas at all, and are not mere machines, as fome would have them, we cannot deny them to have some reason. It feems as evident to me, that some of them do, in certain instances, reason, as that they have sense; but it is only in particular ideas, just as they received them from the senses, They are the best of them tied up within those narrow bounds, and have not, as I think, the faculty to enlarge them by any kind of abstraction." Essay on Human Understanding, Book II. chap. 11.

This is in part a just observation, and serves to account for many phenomena which later writers have derived from inflinet. The author of The Philosophy of Natural History had " a cat that frequented a closet, the door of which was faftened by a common iron latch. A window was fituated near the door. When the door was shut, the cat gave herself no uneasiness. As foon as she tired of her confinement, she mounted on the fole of the window, and with her paw dexteroully lifted the latch and came out." This practice, which we are told continued for years, must have been the confequence of what Locke calls reasoning in particular ideas. It could not be the effect of inftinct; for inftinct is adapted only to a flate of nature, in which cats have neither latches to lift nor doors to open; and as it is not faid that the animal attempted to lift the latches of other doors, we are not authorifed to infer that this particular action was the confequence of reafoning in ideas enlarged by abstraction: the cat had repeatedly seen one door opened by an exertion which she was capable of imitating. Yet that animals have no power of enlarging their ideas, is a position, of the truth of which, though it is advanced by Locke, we are by no means confident. It is well known that crows feed upon feveral kinds of shell-fish when within their reach; and that they contrive to break the shell by railing the fift to a great height, and letting it drop upon a stone or a rock. This may perhaps be considered as pure inflinct directing the animal to the proper means of acquiring its food. But what is to be thought of the following fact, which was communicated to us by a gentleman whose veracity is unquestioned, and whose being totally unacquainted with the theories of philosophers, has of course no favourite hypothesis to support? In the spring of the year 1791, a pair of crows made their nest in a tree, of which there are several planted round his garden; and in his morning-walks he had often been amused by witnessing furious combats between them and a cat. One morning the battle raged more fiercely than usual, till at last the cat gave way and took shelter under a hedge, as if to wait a more favourable opportunity of retreating to the house. The crows continued for a short time to make a threatening noise; but perceiving that on the ground they could do nothing more than threaten, one of them lifted a Rone from the middle of the garden and perched with it on a tree planted in the hedge, where she sat watching the motions of the enemy of her young. As the cat crept

Inflinet. have always remained the fame without degeneracy, and without improvement; and if they be at the fame time the refult of reasoning; they must either be so perfect that they cannot be improved, or so imperfect that they cannot degenerate. That the structure of a honey-comb is imperfect, no man has ever imagined. We have feen, that, as far as we are capable of difcerning the end which it is intended to ferve, it is the most perfect structure possible : and therefore, if it be the result of the reasoning of the bee, the author must retract his affertion respecting the extent of the reasoning and thinking powers of inserior animals; and instead of faying that they are remarkably deficient when compared with those of men, affirm that they are infinitely more perfect. No human art has yet arrived at fuch perfection as that it might not be improved; no architect has ever built a town, or conftructed a magazine, which he could mathematically demonftrate to be of the very best possible form for the end intended, and fo absolutely perfect as to be incapable of improvement.

The laft position

But the fame author proceeds to affirm, that " the mentioned laws of analogical reasoning do not justify the idea that the brutes act, on any occasion, absolutely without defign." Nay, he fays, it feems more probable, 46 that the inferior animals, even in those instances in which we cannot diffinguish the motives which actuate them, or the views with which they proceed, yet act with defign, and extend their views, if not a great way, yet at least a certain length forward; than that they can be upon any occasion, such as in rearing of their young, building nefts, &c. actuated merely by feeling, or over-ruled by fome mysterious influence, under which they are nothing but infenfible inftruments." This last plirase is ambiguous. If by infenfible instruments it be meant that the brutes are confidered by the advocates for inftinct as mere machines without the faculties of fensation and spontaneity, the author is combating a phantom of his own creation; for we believe an opinion fo abfurd is not now maintained by any man, (fee BRUTE). But if by infenfible inftruments be meant fuch inftruments as act fpontaneously without being confcious of the end to which their actions lead, he appears not only to be egregiously mistaken in his conjecture respecting the defign of brutes, but also to have advanced an hypothefis contradictory and inconfiftent.

If it be true, that the inferior animals act with defign, even in those instances in which we cannot diftinguish their motives, their views may indeed ex. Inftinct. tend but a little way when compared with infinity: but certainly they extend farther than ours; for there Maintainis no ufeful work of man constructed with fuch skill, ed, and

but that, after it is finished, another man of equal education will be able to diftinguish the general defign of the artist. But if the inferior animals, on alloccasions, act with defign, we should be glad to know the defign of the bees in forming the cells of their combs in the manner which we have so largely described. Dothese little animals indeed know that a comb, confisting on both fides of hexagonal cells, with the bottom of each composed of several planes meeting in a certain solid angle, and fo formed as that the bottom of a cell on the one fide shall rest upon the partitions between the cells on the other fide, is in all respects the most proper both for holding their stores of honey and for rearing their young? And do they likewife know, that its excellence arises from the precise figure and position of the cells, by which there is a very confiderable faving of labour and materials, whilft the comb at the fame time has the greatest possible firength, and the greatest possible capaciousness? If they know all this, and act with a view to these ends, it must indeed be confessed that bees are rational creatures, and that their thinking and reasoning powers far surpass those of men; for they have from the earliest ages made discoveries in the higher mathematics, which there is reason to believe were altogether unknown to the human race till the beginning of the prefent century, and which at this moment are beyond the comprehension of nine-tenths of mankind in the most enlightened nation on earth. If this be a conclusion too absurd to be admitted, there is no other alternative, but either to suppose that by this artificial structure of their cells the bees have some other end in view, which we cannot distinguish; or to acknowledge, that they are over-ruled by fome mysterious influence, under which they are nothing but fpontaneous agents, unconscious of the end to which their operations tend. Which of these conclusions is the most rational, we will not offer fuch an infult to the understanding of our readers, as to suppose the meanest of them capable of entertaining a doubt. That a honey comb is constructed with defign, we most readily admit; but the defign is not in the bees, but in the Creator of the bees, who directs their operations to their own good, by what the author with great propriety terms a mysterious influence (D).

But he thinks it an unanswerable argument in sup- An objecport tion to it

along under the hedge, the crow accompanied her by flying from branch to branch and from tree to tree; and when at last puss ventured to quit her hiding-place, the crow, leaving the trees and hovering over her in the air, let the ftone duop from on high on her back. That the crow on this occasion reasoned, is self-evident; and it feems to be little less evident, that the ideas employed in her reasoning were enlarged beyond those which she had received from her fenses. By her fenses she may have perceived, that the shell of a fish is broken by a fall; but could her fenses inform her, that a cat would be wounded or driven off the field by the fall of a ftone? No; from the effect of the one fall preserved in her memory, she must have inferred the other by her power of reasoning.

(D) Though this way of acting is undoubtedly mysterious, " yet it should not appear extraordinary even to a man who is not a philosopher, as we see examples of it daily in our own species: For a man under the direction of another of superior understanding, will use means to accomplish an end, without having any idea of either; and indeed in my opinion, by far the greater part of mankind are deftined by God and nature to be

governed in that way." Ancient Metaphyfics, Vol. III. p. 352.

toffinet, port of his theory, that in the performance of those actions, in which animals are faid to be guided by unerring inftinct, different individuals display different modes of conduct; and in his opinion, to talk of instinctive principles which admit of improvement, and accommodate themselves to circumstances, is merely to introduce new terms into the language of philosophy; for he affirms, that no fuch improvement or accommodation to circumstances can ever take place without a comparison of ideas, and a deduction of inferences. It is probable, that the author here alludes to those animals which, in their most important operations, are known to act differently in different countries. Thus the offrich in Senegal, where the heat is excessive, neglects her eggs during the day, but fits upon them in the night. At the Cape of Good Hope, however, where the degree of heat is less, the offrich, like other birds, fits upon her eggs both day and night. In countries infested with monkeys, many birds, which in other climates build in bushes and clefts of trees, fuspend their nefts upon slender twigs, and thus elude the rapacity of their enemies.

Obviated.

It may be thought, that a determination of the mind of the brute to act fo variously upon different occasions. can hardly be conceived without judgment or intelligence. But before our author had fo confidently affirmed that fuch accommodation to circumflances can never take place without a comparison of ideas and a deduction of inferences, he would have done well to confider how nature acts in other organized bodies, fuch as the vegetable. We fee that a vegetable, reared in the corner of a dark cellar, will bend itself towards the light which comes in at the window; and if it be made to grow in a flower-pot, with its head downwards, it will turn itself into the natural position of a plant. Can it be supposed, that the plant, in either case, does what it does from any judgment or opinion that it is best, and not from a necessary determination of its nature? But, further, to take the case of bodies unorganized, how shall we account for the phenomena which chemistry exhibits to us? When one body unites with another, and then, upon a third being prefented to it, quits the first, and unites itself with it, shall we suppose that this preference proceeds from any predilection or opinion that it is better to cleave to the one than to the other, from any comparison of ideas or deduction of inferences? Or shall we not rather fay, that it proceeds from an original law of nature impressed upon it by that Being who mediately or immediately directs every motion of every the minutest atom in the universe? And if fo, why may not inftinct be an original determination of the mind of the animal, of which it is part of the nature or essence to accommodate itself to certain cirflances.

But though we cannot agree with this author when Inflinet. he affirms that no accommodation to circumftances can ever take place without a comparison of ideas, we rea- lossing indily admit that no faculty which is capable of improve- capable of ment by observation and experience can in propriety improveof speech be termed inftinct. Inftinct being a politive ment. determination given to the minds of animals by the Author of nature for certain purposes, must necessarily be perfect when viewed in connection with those purpoles: and therefore to talk, as Mr Smellie does, of the improvement of inftinct, is to perplex the understanding by a perversion of language. There is not, however, a doubt, but that reason may copy the works of instinct, and fo far alter or improve them as to render them fubfervient to other purposes than those for which they were originally and inftinctively performed. It was thus in all probability that man at first learned many of the most useful arts of life.

" Thy arts of building from the bee receive; " Learn of the mole to plough, the worm to weave;

" Learn of the little nautilus to fail, " Spread the thin oar, and catch the driving gale.

But the arts thus adopted by men are no longer the works of instinct, but the operations of reason influenced by motives. This is fo obvioufly and undeniably true, that it has compelled the author last mentioned to confess, in that very section which treats of instincts improveable by experience, that " what men or brutes learn by experience, though this experience be founded on inftinct, cannot with propriety be called inftinctive knowledge, but knowledge derived from experience and observation. Instinct (he fays) should be limited to fuch actions as every individual of a species exerts without the aid either of experience or imitation." This is a very just distinction between instinct and experiences but how to reconcile it with the fundamental principle of the author's theory we know not. It would certainly be a very arduous task; but it is a task from which we are happily relieved, as his theory and ours have little refemblance.

Having thus proved, we hope to the fatisfaction of

our readers, that there is such a principle as instinct in the inferior animals, and that it is effentially different The quefrom human reason; let us return to our own species, stion. When and inquire whether there be any occasions upon which therethere man acts inftinctively, and what those occasions are be any oc-This is a question of fome difficulty, to which a com- casions up on which plete and fatisfactory answer will perhaps never be gi- on which ven, and to which we have not the vanity to think inflinctivethat fuch an answer will be given by us. The prin-ly? examiciple of affociation (to be explained afterwards under ned. the article METAPHYSICS) operates fo powerfully in man, and at so early a period of life, that in many cumftances, on which depends the prefervation of the cases it seems to be impossible to distinguish the efindividual, or the continuation of the kind? Indeed it fects of habit from the operations of nature. Yet there cannot be otherwise, if we have defined inflinct proper- are a few cases immediately connected with the preferly: for no man ever supposed, that when animals work vation of the individual and the propagation of the intinctively, they act for no purpose. It is only af- kind, in which by a little attention these things may be firmed that the purpose is not known to them. It is distinguished. We have already given an instance in known, however, to the Author of inftina; who knows the facking of a child, which we believe to be an olikewise that the same purpose must in different cli- peration performed by instinct. Dr Priestley, howmates be promoted by different means, and who ac- ever, thinks differently: " The action of fucking cordingly determines the operations of animals of (fays he), I am confident, from my own observations. the fame species to be different under different circum- is not natural, but acquired." What observations they were which led him to this conclusion he has not told

Infline. us, and we cannot imagine; but every observation which we ourselves have made, compels us to believe that an attempt to fuck is natural to children. It has been observed by the author of the Philosophy of Natural History, that the instinct of sucking is not excited by any fmell peculiar to the mother, to milk, or to any other substance; for that infants suck indiscriminately every thing brought into contact with their mouths. He therefore infers, that the defire of fucking is innate, and coeval with the appetite for air. The observation is certainly just: but a disciple of Dr Prieftley's may object to the inference; for " in fucking and swallowing our food, and in many such instances, it is exceedingly probable (fays the Doctor), that the actions of the muscles are originally automatic, having been so placed by our Maker, that at first they are stimulated and contract mechanically whenever their action is requifite." This is certainly the cafe with respect to the motion of the muscles in the action of breathing; and if that action be of the same kind and proceed from the very same cause with the action of fucking, and if a child never show a defire to suck but when fomething is brought into contact with its mouth, Dr Priestley's account of this operation appears to us much more fatisfactory than that of the authors who

attribute it to instinct. 26 Inftances of

human ac-

But the actions of breathing and fucking feem to differ effentially in feveral particulars. They are indeed both performed by means of air; but in the former, a child for many months exerts no fpontaneous effort, whilft a spontaneous effort seems to be absolutely necessary for the performance of the latter. Of this indeed we could not be certain, were it true that infants never exhibit symptoms of a wi/h to suck but when fomething is actually in contact with their mouths; for the mere all of fucking then might well be fupposed to be automatic and the effect of irritation: But this is not the case. A healthy and vigorous infant, within ten minutes of its birth, gives the plainest and most unequivocal evidence of a defire to suck, before any thing be brought into actual contact with its mouth. It firetches out its neck, and turns its head from fide to fide apparently in quest of fomething; and that the object of its purfuit is fomething which it may fuck, every man may fatisfy himfelf by a very convincing experiment. When an infant is thus stretching out its neck and moving its head, if any thing be made to touch any part of its face, the little creature will inflantly turn to the object, and endeavour by quick alternate motions from fide to fide to feize it with its mouth, in the very fame manner in which it always feizes the breaft of its nurse, till taught by experience to diftinguish objects by the sense of fight, when these alternate motions, being no longer ufeful, are no longer employed. If this be not an instance of pure instinct, we know not what it is. It cannot be the refult of affociation or mechanism; for when the stretching of the neck takes place, nothing is in contact with the child's mouth, and no affociation which includes the act of fucking can have been formed. Affociations of ideas are the confequences of fimultaneous impressions frequently repeated; but when the child first declares, as plainly as it could do were it poffeffed of language, its wish to fuck, it has not received a fingle impression with which that with can possibly be associated.

Vol. IX. Part I.

Were Dr Priefley to weigh these facts, of the truth Inflinct. of which we are certain, we doubt not that his wellknown candor would make him retract the affertions that all the actions which Dr Reid and others refer to inflinct, are either automatic or acquired. The greater part of those actions, as well as of the apparently inftinctive principles of belief, we have no doubt are acquired: but we are perfuaded that a child fucks its nurse as a bee builds it cell, by instinct: for upon no other hypothesis can we account for the spontaneous efforts exerted in both these operations; and we think it no differace to our species, that in some few cases we should act from the same principle with the inferior creation, as nothing feems more true than that,

Reafon raife o'er instinct as we can; In this 'tis God that works, in that 'tis man.

We have faid, that, in the favage flate, the fexes go together for the first time by instinct, without any view to offspring, and perhaps with no determinate idea of enjoyment. This opinion, we believe, has been generally maintained; but it is controverted by Dr Hartley. " Here (fays he) we are to observe, first, that when a general pleasurable state is introduced, either by direct impressions or by associated influences, the organs of generation must sympathize with this general state, for the same reasons as the other parts do. They must therefore be affected with vibrations in their nerves, which rife above indifference, into the limits of pleasure, from youth, health, grateful aliment, the pleasures of imagination, ambition, and fympathy, or any other cause which diffuses grateful vibrations over the whole fyftcm .- Secondly, as thefe organs are endued with a greater degree of fenfibility than the other parts, from their make, and the peculiar ftructure and disposition of their nerves, whatever these be, we may expect that they should be more affected by those general pleasurable states of the nervous system than the other parts .- Thirdly, the diffention of the cells of the veficula feminales, and of the finuses of the uterus, which take place about the time of puberty, must make these organs more particularly irritable His fourth observation respects a state widely different from that of nature, and therefore is nothing to the purpole : but his fifth is, that " the particular shame which regards the organs of generation, may, when confidered as an affociated circumstance, like other pains, be so far diminished as to fall within the limits of pleafure, and add confiderably to the fum total."

To this excellent and able writer we may allow the truth of these observations (though some of them might certainly be controverted); and yet deny his conclusion, that " they are sufficient to account for the general defires which are observable in young persons, and that those desires are of a sactitions nature." For fuppoting every thing which he mentions to take place by mere mechanism and association; that the organs of generation are irritated, and certain cells and finuses diffended; the only inference which can be fairly drawn from fuch premises is, that at the age of puberty young men and women must from these causes experience certain feelings and wants which they knew not before; but furely mechanism and affociation cannot teach them the use of the organs of generation, or point out the only means by which their new feelings can be grati-

Inflinct. fied : and therefore, as we fee thefe means invariably purfued by all animals rational and irrational, without experience and without instruction, we must refer the mutual defire of the fexes to a higher principle than mere mechanism and affociation; and that principle

can be nothing but inflinct.

Befides thefe, we think the action of eating may be attributed to inflinct. It is certainly performed by a spontaneous exertion of the proper organs; and that exertion is first made at a time of life when we have no conception of the end which it ferves to accomplish, and therefore cannot be influenced by motives. It must indeed be confessed, that the first act of chewing is performed by a child, not for the purpose of masticating food, but to quicken the operation of nature in the cutting of teeth : and perhaps it may be faid, that the pleasing fensation of take, which is then first experienced, and afterwards remembered, prompts the child to continue at intervals the exertion of chewing after all its teeth are cut; fo that though the act of eating is not performed with a view to the mastication of food or the nourishment of the body, it may yet be performed, not from any inflinctive impulse, but merely from an early and deep-rooted affociation. But in answer to this it is sufficient to ask, Who taught the infant that the act of chewing would quicken the operation of nature in the cutting of teeth? Not reason, furely, nor experience; for an infant knows nothing of teeth or the manner in which they grow : and if it be granted, that for this purpole it was originally impelled by fome internal and mysterious influence to perform the action of chewing, we are not inclined to deny that the operation may be continued for other purposes by means of affociation.

In human works, though laboured on with pain, A thousand movements scarce one purpose gain; In God's, one fingle can its end produce, Yet ferves to fecond too fome other ufe

This is found philosophy confirmed by observation and daily experience : but though in the works of God, one principle produces many confequences, and though perhaps there is not a principle which falls under our cognizance more fruitful than that of affociation, yet if it be not sufficient to account for the first all of chewing, we cannot refer to it alone as to the fource Inflinet. of that operation. Should it be faid, that the gums of an infant are at the period of cutting teeth fo irritable, that the moment any thing is applied to them the jaws perform a motion merely automatic, which we miltake for the spontaneous effect of instinct; still we would ask, What prompts the child to apply every thing to its mouth? Does the irritation of the gums contract the muscles of the arm? By a bigot for mechanism this might be faid, were it true that the arm of an infant, like a piece of clock-work, is always fo regularly moved as to bring its hand directly into contact with its gums : but this is far from being the cafe; an infant makes many unfuccefsful efforts to reach its mouth, and does not accomplish its purpose till after repeated trials. Perhaps it may be alleged (for when men adopt a favourite hypothesis they will allege any thing in its funport), that infants are taught to carry things to their mouths by the pleasing sensation received from the application of their nurses breafts, and continue the practice from habit and affociation. But it is certain that they do not begin this practice till teeth are forming in their gums; and then they use such things as they themselves carry to their mouths very differently from the breafts of their nurse: they constantly chew and bite their rattles, though they very feldom bite their nurses. As this practice cannot be begun from a principle of affociation, fo it appears to us that it cannot be continued upon fuch a principle. Were the fenfation experienced by an infant when chewing a hard fubftance a pleafing fenfation, the remembrance of the pleafure might as a motive prompt it to repeat the operation : but it is obvious, that by preffing a gum, through which a tooth is making its way, against any thing hard, the infant must experience a painful fensation; and therefore the influence which impels it to continue this operation, must be fomething more powerful than pleasure or pain (A).

These three actions, then, by which infants fuck, by There may which they chew their food, and by which mankind be other are propagated, have undeniably their origin in in-actions inftinct. There may be many other human actions which it is which derive their origin from the fame fource (D); impossible but to diftin-

guish from of habit.

(A) A learned physician, to whom this article was shown in manuscript, and to whose animadversions it is indebted for great part of what merit it may posses, thinks that the pain arising from the cutting of teeth is alleviated by the chewing of hard fubiliances, and that this is the cause of that inclination which infants have perpetually to chew. To give probability to an opinion which admits not of direct proof, he observes, that the violent pain in the glans penis occasioned by a stone in the bladder, is certainly alleviated by rubbing the glans and pulling the prepuce, which is therefore a very frequent employment of all who are afflicted with that dreadful disorder. Notwithflanding the deference which we willingly pay to the judgment of our friend, we can per-ceive no analogy between these two cases, which, to be of any use to his argument, ought to be not only analogous but fimilar. It is well known that rubbing the glans penis will almost at any time give a pleasing fensation; and it is easy to conceive how two opposite fensations, excited at once in the same place, may counterbalance each other, fo as to leave the patient equally free from pleasure and pain. But is it conceivable, that to press against a hard substance a gum in which a tooth is forming, should excite a pleasing sensation? If it be, our friend's opinion accounts better than ours for the continuance of the practice of chewing; but fill it must be inflind, which, on either supposition, first directs the infant to that operation, for it cannot be begun

(D) The reftleffness which perpetually accompanies the passage of a stone from the kidneys through the ureters, has by many been confidered as the effect of inflinct; and their opinion is not without a plaufible foundation. In a nephritic paroxyim, a man rifes from his chair, throws himself down with violence, and rifes Inflinet. but in a flate of civil fociety it is very difficult, if not impossible, to distinguish them from the effects of early

Such, however, is the prefent impatience of that labour without which effects cannot be traced to their causes, that every phenomenon in human nature, which to former philosophers would have occasioned difficulty, is now thought to be fufficiently accounted for by he who can provide himself with a sufficient number of these instincts, for the reality of which he offers no proof, feats himfelf in the philosopher's chair, and dreams that he is dictating a fystem of science, whilst he is only retailing a collection of anecdotes. A philosopher of this school has lately carried the doctrine Actions er- of inftinctive principles fo far, as to attribute the fuperiority of man over the other animals, chiefly to the to inflinet, great number of inflinets with which his mind is endowed; and among thefe he reckons (not, we believe, as characteristic of our species in contradistinction to other nefs of which our fuperiority confilts) "the voiding of on the application of any painful ftimulus, the moving of the eye-lids and other parts of the body." These the is fometimes represented as looking into futurity, and acting upon motives which has hitherto been confidered as the province of reason and the characteristic of man : here the fame inftinct is confounded with irritation and mechanism; and if this mode of philosophifing continue in fashion, we shall not be surprifed to find men, beafts, birds, and vegetables, confidered of the fame genus of beings, that are all actuated by the great and univerfal principle of instinct. If sneezing and the retraction of the muscles upon the application of any painful flimulus be actions of inflinct, there cannot be a

doubt, upon the received principles of philosophy, but that Inflinet. the application of any ftimulus proceeds likewife from inflinct : nav, a piece of leather must be endowed with fimilar effects produced by the fame or fimilar caufes: for in the operations of fneezing and retracting the muscles upon any painful application, there is not the least fpontaneous exertion on our part, no co-operation and the plant. With respect to the voiding of urine and excrement, it is obvious, that at first these operations are performed without any effort of spontaneity; and that a voluntary power over the mufcles which are subservient to them is very gradually acquired. Urine and excrement irritate the bladder and guts, which are fupplied with branches of the fame nerves that fupply the abdominal mufeles. But it is well known that the irritation of one branch of a nerve plied by the other branches. Urine and excrement therefore are evidently expelled by the mechanical contraction of the organs of excretion; and to attribute these evacuations to inslined, is equally absurd as to fay, that water or any other foft fubitance pent up in a by inflinet through the easiest passage. It is difficult to que's what the author means by the inftinctive motion of the eve-lids and other parts of the body. There is a motion of the eve lids which is voluntary, and another which is involuntary. The former proceeds from fome motive, to exclude too great a glare of light, or to guard the eye against a foreseen mischief, and is therefore the result of reason as distinguished from inflinct : the latter is obviously the effect of affociation, which took place in early infancy and produced a habit. Infants for feveral days after birth do not wink with their eyes upon the approach of one's

again he knows not why. These motions are certainly performed by spontaneous exertions; and as they tend to quicken the descent of the stone, they serve the best of purposes. Yet though they are not performed with this view, and though nine-tenths of mankind know nothing of their falutary tendency, we would not be too positive that they proceed from inflinct. A man suffering violent pain tries every experiment to procure relief; and if these incessant changes of posture be begun with any view of this kind, however indillinet, they commence from reason, and may be continued by habit. If they be begun with no view whatever, they

(E) "As intellect is latent for a confiderable time in the individuals among us, and must have been latent for a very long time, perhaps for ages, among favages, it is not to be supposed that Nature, in that natural and primitive state, would leave us unprovided with what she has so bountifully bestowed upon other animals. What particular inflinct man then had, it is difficult to fay; but this we may be affured of, that he had all that was necessary for his being and well-being: but not so much would be necessary to him as to other animals, whose economy is more artificial than that of man, his being very simple, and much resembling that of cattle and horses. After he had acquired intellect, reason would, in some measure, supply the place of instinct : and there remains nothing now of inflinet among us, except what appears in our infants before they have got the use of reason; such as their applying to the breast of the mother for nourishment. By the use of intellect, and the arts and sciences invented by us, we have formed a system of life altogether different from the natural." Ancient Metaphyfics, vol. ii. page 300.

Whether intellect was for ages latent among favages, this is not the proper place to inquire. It is a question which may be considered afterwards, when the author's opinion respecting the four minds in man paffes under our review: but whatever may be thought of these peculiar sentiments, the reason here assigned for the difficulty of afcertaining the genuine inflines of man, will be admitted by all who have thought suffici-

268 7

Inflina. hand or any other fubiliance; but after having experienced pain from too much light or any other thing which hurts the eye, and that pain having at first produced an automatic motion of the eve-lids, the motion comes in time to be fo closely affociated with its cause, that the very appearance of the latter produces the former. In all this there is no inftinct, nor any thing which resembles instinct: in the one case, the motion of the eye-lids is in the ftricteft fense voluntary and rational; and in the other, it is either automatic or the effect of habit.

" The love of light (fays the fame writer) is exhibited by infants at a very early period. I have remarked evident fymptoms of this attachment on the third day after birth. When children are farther advanced, marks of the various passions generally appear. The passion of fear is discoverable at the age of two months. It is called forth by approaching the hand to the child's eye, and by any fudden motion or unufual noise." It has likewise been faid, that "an infant may be put into a fright by an angry countenance, and foothed again by fmiles and blandishments;" and " that all these are cases of pure inflinct." In reply to which, we feruple not to affert with Dr Priestley, that an infant (unless by an infant be meant a child who has a good deal of experience, and of course has made many observations on the connections of things) " is abfolutely incapable of terror. I am politive (fays he), that no child ever showed the least symptom of fear or apprehension till he had actually received hurts and had felt pain; and that children have no fear of any particular perfon or thing, but in consequence of some connection between that person or thing and the pain they have felt. If any inflinct of this kind were more necessary than another, it would be the dread of fire. But every body must have observed, that infants show no fign of any such thing; for they will as readily put their finger to the flame of a candle as to any thing elfe, till they have been burned. But after fome painful experience of this kind, their dread of fire, though undeniably the effect of affociation, becomes as quick and as effectual in its operations as if it were an original instinctive principle." We moreover do not helitate to fay, with the same great philosopher, that if it were posfible always to beat and terrify a child with a placid countenance, fo as never to assume that appearance but in those circumstances, and always to foothe him with what we call an angry countenance, this connection of ideas would be reverled, and we lighted with a frown. In fact, there is no more reason to believe that a child is naturally asraid of a frown, than that he is afraid of being in the dark; they have either found fomething difagreeable to Inflinct. them in the dark, or have been told that there is fomething dreadful in it.

The truth of these observations is so obvious, that we doubt not but they will carry conviction to the mind of every reader. For though it should be granted, that fo early as on the third day after birth children exhibit fymptoms of uneafiness upon the sudden exclusion of light, it would by no means follow that the love of light is in them instinctive (A). Light operates upon the eye by contact, and communicates to the infant a fensation of touch. If that fensation be pleafant, the child must necessarily feel some degree of uneafinefs upon its removal, just as a full grown man must feel uneafy upon being deprived of any positive pleasure. But is fensation, or pleasure, or the removal of pleafure, pure instinct? No, furely.

Thus difficult is it to fay in many cases what actions have their origin in instinct, and what are merely the effects of early affociation. But we think it may be fafely affirmed, that no action, whether of man or brute, which is deliberately performed with a view to confequences, can with any propriety be faid to proceed from inflinct; for fuch actions are the effect of reason influenced by motives. Deliberation and inflinct are obviously incompatible. To fay with the author of the Philosophy of Natural History, " that, when we are stimulated by a particular instinct, instead of instantly obeying the impulse, another instinct arises in opposition, creates helitation, and often totally extinguishes the original motive to action," is either to affirm what is apparently not true, or it is a groß pervertion of language. Motives opposed to each other may create hesitation, and a powerful motive may counterbalance a feeble inflinct; but of two or more inflincts operating at the fame time, and opposing each other, we have no conception. Inftinct, if we choose to speak a language that is intelligible, means a certain impulse under the direction of Supreme Wisdom; and it is very little probable that fuch wifdom should give opposite impulses at the fame inftant. In the natural works of animals, which are confessedly under the influence of instinct, we perceive no symptoms of deliberation; but every one, when not interrupted by external violence, proceeds without hefitation in the direct road, to an end of which the animal itself knows nothing. The fame would be the case with man were he under the guidance of inflinct: and it is vain to fay that the inftinct of fear is daily counteracted by ambition and refentment, till it be proved that fear, ambition, and refentment, are really instincts. Of this, however, the author should fee the child frighted with a fmile and de- feems to have no doubt. Indeed his work is fo liberally flored with these principles, so useful to every man who wishes to acquire the name of a philosopher without the labour of investigation, that not only fear, and of this children certainly discover no fign, till ambition, and refertment, but even supersition, devotion,

⁽A) It may with equal propriety be faid, and upon apparently better evidence, that children have an inflinctive love of darkness. A child who has been for some time in a dark room, will exhibit stronger symptoms of uneafiness upon the fudden introduction of candles, than he would upon candles being fuddenly carried out of a room which had been for fome time illuminated. This fact, and the reason of it, are well known to every man who has but barely dipt into the science of Optics: but no philosopher, till author arose, ever thought of accounting for it by the short and easy method of instinct.

Infind. respect for eminent characters, avarice, hope, envy, benevolence, and sympathy, are all, in his opinion, instincts simple or modified. The origin of sear we have already feen when examining the instincts said to exhibit themselves in early infancy: let us try if we cannot trace some other individuals of this numerous family to the fame fource of early affociations.

19 Source of this er-FOF.

The cafe then feems to be as follows. We first perceive or suppose some real good, i. e. some fitness to promote our happiness, in those things which we love or defire. Hence we annex to those things the idea of pleasure: with which they come, in time, to be so closely affociated in our minds, that they cannot ever after prefent themselves without bringing that idea along with them. This affociation likewife often remains even after that which first gave rife to it is quite forgotten, or perhaps does not exist. An instance or two will make this very clear. No man can be born a lover of money; for in a flate of nature money exists not : no man therefore can be born with our author's inflinct of avarice, directed in the manner which the most common acceptation of that word denotes. Yet how many men are there in the world, who have as flrong a defire for money as if that defire were innate and inflinctive; who account fo much money fo much happiness; and who make the mere possession of gold and filver, without any thought or defign of using them, the ultimate end of all their actions? This is not because the love of money is born with them, for that is impossible; but because they first perceive a great many advantages from the possession of money, whence they conceive a pleasure in having it. Hence they defire it, endeavour to obtain it, and feel an actual pleasure in obtaining and possessing it. Then, by dropping the intermediate steps between money and happiness, they join money and happiness immediately together, and content themselves with the phantastic pleafure of having it; making that which was at first purfued only as means, be to them an ultimate end, in which confifts their happiness or misery. The same might be observed concerning the thirst after knowledge, fame, ambition, and most of the various purfuits of life. These are at first entered upon with a view to fome farther end, but at length become habitual exercises; with which the idea of pleasure is fo closely affociated, that we continue the pursuit after the reason from which it was at first begun has entirely vanished from our minds. Hence also we may account for another of our author's modified inflinas, the almost diabolical feeling of envy. Mr Locke observes, that there are some men entirely unacquainted with this passion. His observation we believe to be a just one : for most men that are used to reflection, remember the time when they were first under its influence; and though they did not, it is a thing very little likely that the beneficent Author of nature should have implanted in the human mind even the feeds of an instinct, which, in the emphatic language of the Rambler, " is mere unmixed and genuine evil." Envy is that pain which arifes in the mind upon observing the success or profperity of others; not however of all others indefinitely, but only of those with whom, upon some account or other, the envious perfon has once had a rivalship. But of fuch a feeling the origin is obvious; for when two or more persons are competitors for the same

thing, the fuccels of the one necessarily tends to the Inflinct detriment of the other: hence the fuccess of the one rival is in the mind of the other closely affociated with pain or mifery; and this affociation remaining after the rivalship which occasioned it has ceased, the person in whose mind envy is thus generated, always feels pain at the fuccess of his rival even in affairs which have no relation to the original competition. Thus it is, that we are apt to envy those persons who refuse to be guided by our judgments, or perfuaded by our arguments: For this is nothing else than a rivalship about the superiority of judgment; and we take a secret pride. both to let the world fee, and in imagining ourfelves. that in perspicacity and strength of judgment we have no function.

Though the principle of affociation will be more fully explained in another place, there is one obiervation which must not be omitted here; it is, that we do not always, nor perhaps for the most part, make these affociations ourselves, but learn them from others in very early life. We annex happiness or misery to certain things or actions, because we see it done by our parents or companions; and acquire principles of action by imitating those whom we effect, or by being told, by those in whom we have been taught to place confidence, that fuch conduct will promote our happinefs, and that the reverse will involve us in mifery. Hence the fon too often inherits both the vices and the party of his father as well as his effate; hence national virtues and vices, dispositions and opinions; and hence too it is, that habits formed before the period of diffinct remembrance are fo generally miltaken for na-

From the whole then of this investigation, we think Mon perourselves warranted to conclude, that there is an effen-form ratiotial difference between mechanism and intlinet, and tive, and between both and reason; that mankind perform ac-automatic tions by each of these principles, and that those ac actions. tions ought to be carefully diftinguished; and, though the human mind is unquestionably endowed with a few inflincts necessary to the preservation of the individual and the propagation of the race, that by far the greater part of those actions which are commonly faid to proceed from instinct are merely the effects of early habits. We are likewise of opinion, that the present fashionable mode of referring almost every phenomenon The danger in human nature to a particular inflinct as its ultimate of reference cause, is hurtful to science, as tending to check all phonefurther inquiry; and dangerous in morals, as making non in hupeople implicitly follow, as the dicates of nature and man nature. nature's God, the abfurd, superstitious, or impious customs to a parti-

INSTITUTES, in literary history, a book con-ultimate

taining the elements of the Roman law.

The inflitutes are divided into four books; and contain an abridgment of the whole body of the civil law, being defigned for the use of fludents. See Law. nº 6,-11. and 43, 44.

INSTITUTE, in Scots law. When by disposition or deed of entail a number of persons are called to the fuccession of an estate one after another, the perfon first named is called the institute, the others substi-

INSTITUTION, in general, fignifies the effablishing or founding fomething .- In the canon and i

flind as its

1. frument common law, it fignifies the investing a clerk with the ed the infurers or under-suriters: the parties for whose Infurence. Infurance, first unlities of a rectory, &c. which is done by the fecurity they engage are called the infured; and the bishop, who uses the following formula: " I institute premium is understood to be paid when the insurance is you rector of fuch a church with the cure of fouls,

and receive your care and mine." INSTITUTIONS, in literary matters, denote a fystem of the elements or rules of any art or fcience.

Thus physical, or medicinal institutions, are fuch as teach the necessary pracognita to the practice of me-

dicine, or the cure of difeafes. INSTRUMENT, in general, whatever is fubfer-

vient to a cause in producing any effect.

Mathematical, Philosophical, &cc. INSTRUMENTS. See ASTRONOMY, ELECTRICITY, GEOMETRY, LEVELLING, Mechanics, Optics, PREUMATICS, &c. &c.

INSTRUMENT is also used in law, to fignify fome public act, or authentic deed, by means whereof any truth is made apparent, or any right or title establish-

Notorial INSTRUMENT, in Scots law, any fact certified in writing, under the hand of a notary-public.

INSUBRIUM AGER, (anc .geog.), a diffrict of the Transpadana; situated between the Ticinus to the west, the Addua to the east, the Padus to the fouth, and Orobii to the north. The people called Infubres by Livy, Infubri by Ptolemy, and Isombres by Strabo. Now the Duchy of Milan.

INSULAR, any thing belonging to an ifland .--Infular fituations are productive of many happy confequences to the inhabitants, both with respect to the climate, fecurity, and convenience for commerce; for a particular account of which, fee ISLAND and COAST.

INSULATED, in architecture, an appellation giveng to fuch columns as stand alone, or free from any contiguous wall, like an island in the sea; whence the

INSULATED, in electrical experiments. When any body is prevented from communicating with the earth by the interpolition of an electric body, it is faid to be infulated. See ELECTRICITY, p. 418.

INSURANCE, in law and commerce, a contract, whereby one party engages to pay the loffes which the other may fultain, for a ftipulated premium or confideration. The most common forts are, Insurance against the dangers of the feas, infurance against fire, infurance of debts, and infurance of lives.

I. INSURANCE against Loss at Sea, is a most beneficial institution, for promoting the security of trade, and preventing the ruin of individuals; and is now conducted by a regular fystem of rules, established by the interpolition of the legislature, the decision of the courts of justice, and the practice of merchants.

It is carried on to the best advantage by public companies, or by a confiderable number of private persons, each of whom only engages for a fmall fum, on the fame veffel. There are two public companies established by authority of parliament, viz. the London and Royal Exchange Infurance-Companies. For procuring fubfcription by private perfons, brokers are generally employed, who extend the policy or contract of infurance, procure fubfcriptions, and affift at fettling loffes. They are intitled to an allowance for their trouble, generally 5 per cent. on premiums, and 2 per

The parties who engage to pay the damage are call-

made. On this fubject, we shall consider, What is necessary

to render an infurance valid : --- When the rifk commences, and when it terminates :- What conflitutes a total or a partial lofs :- What proof of lofs is necessary: -and, How the loss is adjusted.

First, In order to render an infurance valid, the infured must have property really at stake; the voyage must take place under the circumstances agreed on; the dangers infured against must not be contrary to law:

and a candid account must be given of circumstances

1. The condition of possessing property was required by 19 Geo. II. c. 37, to prevent thips from being fraudulently dettroyed when infured above their value; and to discourage a practice which had become common. of converting policies to the purpose of mere wagers. In transactions of this kind, as the infured had no property, and could claim no indemnification for partial damage; fo the infurers, having loft their wager by the ship's being loft, could claim no abatement, though part was faved: accordingly, the policies contained clauses of interest or no interest, free from average, and without benefit of falvage. All fuch policies are de-

This restriction does not extend to privateers, nor to thips trading to the Spanish or Portuguese planta tions.

Infurances are commonly made as interest shall appear; and it is incumbent on the infured to prove the value of his property. The value of the goods may be proved by the invoices; and the coquet must be produced, if required, to instruct that the goods were actually shipped. It is admitted to value the ship at prime cost and charges, deducting the freights that have been drawn fince purchased, if the proprietors choose to fland to that rule; but they are not restricted to it. Sometimes the value of the ship or goods is expressed in the policy; and this value must be admitted, although it be higher than the true one: but it is incumbent on the infured to prove that he had property at flake; and, if the property be trifling in comparifon of the fum infured, the infurance will be fet afide, as an evafion of the ftatute.

Expected profits, and bounty on the whale-fishery,

if specified in the policy, may be infured.

When the value is less than the fum infured, the owners may claim a return of premium for the ex-

If there be feveral policies on the same subject, of different dates, the earlier one is valid, and the others must be vacated. If they be of the same date, they must be vacated in equal proportions.

When a policy is vacated, in whole or in part, the under-writers have a right to retain & per cent. for their

trouble.

In the case of a cargo intended for A, but afterwards fent to B, both expected it, and infured, and B claimed for the value on its being loft. The underwriters answered, that it was a double insurance, and they ought only to pay their proportion. Judgment was given, finding them liable for the whole, and referving

Infurance, to them any demand competent against the underwri-

ters who infured for A. Fraudulently to cast away or destroy a ship insured

above its value, is felony.

2. If the ship does not proceed on the voyage, or if, being warranted to depart with convoy, it departs without convoy, the infurance must be vacated.

If the extent of a trading voyage be uncertain, the longest one in contemplation is described in the policy, and it is agreed that part of the premium shall be returned if the voyage be shortened. In like manner, in time of war, when infurance is made without condition; of convoy, it is agreed that part of the premium be re-

turned in case it fail with convoy. When a ship is warranted to depart with convoy, it is understood from the usual place of convoy (e. g. the Downs), and it is infured till it arrive there.

The common proof of failing with convoy is the production of failing orders; but, if a thip be prevented by the weather from receiving the failing orders, other

proof may be admitted.

A fhip was infured from the Thames to Halifax. warranted to fail from Portfmouth with convoy. The convoy had failed before the ship arrived there, and the underwriters declined to infure it, without convoy, for the rest of the voyage. They were found liable to return part of the premium, retaining only in proportion to the accustomed rate from London to Portsmouth. This decision feems to establish the following principle, that, when the voyage performed is only part of that described in the policy, and when the risk can be proportioned, the underwriters are bound to return part of the premium, though there be no agreement for that purpofe.

But, if a ship, insured only against the hazards of the fea, be taken by the enemy, the infured have no right to claim a return of premium, though the capture happen foon, under pretence that little fea-hazard

was incurred.

If a ship deviates from the voyage described in the policy without necessity, it fets aside the infurance. there must be an actual deviation; and, even in that case, the insurers are liable for damages fustained be-

It is no deviation to go out of the way to the accuflomed place of convoy, nor to the nearest place where necessary repairs may be had. Deviation, for the purpole of fmuggling, if without the knowledge of the owners, does not fet afide the infurance, nor when the

mafter is forced by the crew to return. furers are understood to take the risk of detention in

the country, and of country voyages.

3. Infurance of prohibited goods, against the risk of feizure by the government, is unlawful, and invalid. The infurers, infured, brokers, and all acceffories, are

4. If the infured have any information of more than common danger, they must reveal every fuch circumftance to the infurers, otherwife the policy is fet

This rule is established for the preservation of good faith; and there are feveral strong decisions in support of it. If a ship be spoke to leaky at sea, or if there be a report of its being loft, these circumstances

must be communicated to the infurers. Even the Infurance. concealment of a false report of loss vitiates the infurance; and, if the ship be afterwards loft, though in a different manner, the infured will recover nothing. In a voyage from Carolina to London, another ship had failed 10 days after that which was infured, and arrived feven days before the infurance was made; and the concealment of this circumstance, though the fact was not proved to the fatisfaction of the jury, was confidered as sufficient to set it aside. Also, during the continuance of the American war, a fhip being infured from Portugal, by the month, without condefeending on the voyage, failed for North America, and was taken by a provincial privateer. The infurers refused to pay, because the hazardous deffination was

But the infured are not obliged to take notice of general perils, which the infurers are understood to have in contemplation; dangerous navigation, Welt-Indian hurricanes, enterprizes of the enemy, and the

concealed; and it was only upon proof of the infured being equally ignorant of it that they were found

Infurance is not fet afide by a miftake in the name

of the ship or master, or the like.

Infurance may be made on an uncertain fhip; on any ship that the goods may be loaded on; on any fhip that A shall fail in from Virginia. In this last case, the policy is not transferred to a ship which A.

Secondly, If a ship be insured at and from a port, the infurance commences immediately if the ship be there, or at its arrival there. If it be damaged when preparing for a voyage, the infurers are liable; but not if the voyage be laid afide for feveral years, with confent of the owners. Infurance from a port commences when the ship breaks ground; and, if it fet fail, and be driven back and loft in the port, the infurers are liable.

Infurance on goods generally continues till they be landed; but, if they be fold after the fhip's arrival. and freight contracted to another port, the infurance is concluded. Goods fent on board another ship or lighter are not at the risk of the infurer; but goodsfent ashore in the long boat are.

Infurance on freight commences when the goods are

put on board.

Goods from the East Indies, infured to Gibraltar, and to be reshipped from thence to Britain, were put on board a flore-ship at Gibraltar, to wait an opportunity of re-shipping, and were lost: The custom of putting goods aboard a store-ship being proved, the infurers were found liable.

Loss of fails ashore, when the ship is repairing, is comprehended within the infurance. What is neceffarily understood, is infured, as well as what is expreffed; the effential means, and intermediate fleps, as well as the end. Ships performing quarantine are at

the risk of the infurer.

Thirdly, The infurers are liable for a total lofs when the fubject perifhes through any of the perils infured against. Baratry, though it properly signifies running: away with the ship, extends to any kind of fraud in the mafter or mariners. Infurance against detention of princes does not extend to ships that are seized for transgressing the laws of foreign countries.

The infurers are also liable for a total loss, when damage is sustained, and the remaining property aban- the place where stranded. doned or vested in the infurers.

enemy, or detained by any foreign power, or feized for the fervice of the government, the proprietors have

a right to abandon.

But, if a ship be taken by the enemy, and be retaken, or makes its escape, before action against the infurers; have the infured a right to abandon, or must they only claim for the damages fubstained as an average loss? There are opposite decisions, according as the circumstances of the case were strong. When the thip was long detained, the goods perishable, the voyage entirely loft, or fo difturbed, that the pursuit of it was not worth the freight, or when the damage exceeds half the value of the thing, they have been found intitled to abandon; (Gofs against Withers, 2 Burrow, 682.). But, if the voyage be completed with little trouble or delay, they are not intitled; (Hamilton against Mendez, 2 Burrow, 1198.).

The infured cannot claim, as for a total loss, on an offer to abandon. when the lofs is, in its nature, only partial; for, if this were permitted, they might devolve the lofs occasioned by bad markets on the

infurers.

And, in all cases, the insured have their option to abandon, or not. They may retain their property if they pleafe, and claim for an average lofs; and they must make their option before they claim.

If the goods be fo much damaged, that their value is less than the freight, the infurers are accountable as

for a total lofs.

The infurers are liable for general average, when the property is charged with contribution; and for particular average, when the property is damaged, or part of it destroyeed.

If the damage be fuffained through the fault of the ship, the owners of the goods may have recourse, either against the master or insurers; and, if the infurers be charged, they fland in the place of the owners, and have recourfe against the master,

In order to prevent the infurers from being troubled with frivolous demands for average, it is generally stipulated, that none shall be charged under 5 per cent. or some other determined rate; and corn, flax, fruit, fish, and like perishable goods, are warranted free from average, unless general, or the ship be stranded.

In order to encourage every effort to fave the ship, the infurers are liable for charges laid out with that defign, although the fubject perish. Thus, they may be charged with more than the fum infured.

In case of goods being damaged, the proportion of the fum infured, for which the underwriters are liable, is regulated by the proportion of the prices which the found and damaged goods fetch at the port of deftination. The prime cost of the goods is not considered. nor the necessity of immediate fale, in confequence of damage. Although the damaged goods fell above prime coft, the infurers are liable.

Fourthly, If a ship be loft, and the crew saved, the lofs is proved by the evidence of the crew.

If damage be fultained, the extent is proved by an examination of the fubject damaged, at the fhip's arrival; and the cause by the evidence of the crew.

Nº 167.

If the ship be stranded, evidence must be taken at Infurance.

Documents of loss must be laid before the under-If a ship be stranded, or taken, and kept by the writers, with all convenient speed; and, if these be fufficiently clear, the lofs should be immediately settled. The underwriters generally grant their notes at a month

or fix weeks date for their proportions.

If a ship be not heard of for a certain time, it is prefumed loft; and the underwriters are liable to pay the fums infured, the property being abandoned to them in the event of the ship's return. Six months are allowed for a voyage to any part of Europe, a year to America, and two years to the East Indies.

By the ordinance of Hamburgh, if a ship be three months beyond the usual time of performing a voyage, the underwriters may be defired to pay 92 per cent. on an abandon. If they decline it, they are allowed 14 months more, and then they must pay the full

value.

A ship insured against the hazards of the sea, but not against the enemy, if never heard of, is prefumed

loft at fea.

Fifthly, In order that the manner of fettling loffes may be understood, we must explain what is meant by covering property. We mentioned already, that infurances for greater fums than the infured had really at flake, were contrary to law: but fome latitude is allowed in that respect; for if the owner were to insure no more than the exact value of his property, he would lose the premium of insurance, and the abatement, if any was agreed on

For example, if he has goods on board to the value of 100l. and infures the fame at 5 per cent. to abate 2 per cent. in case of loss; then, if a total loss happen, he recovers 981, from the infurers, of which 51. being applied to re-place the premium, the nett fum faved is only 93 l.: but, if the value on board be only 931, and the fum infured 1001, he would be fully indemnified for the lofs; and his property, in that cafe, is faid to be covered.

To find how much should be insured to cover any fum, fubtract the amount of the premium and abatement (if any), from 1001. As the remainder is to 100l. fo is the value, to the fum which covers it.

In case of a total loss, if the sum insured be not greater than that which covers the property, the infurers must pay it all. If greater, they pay what covers the property, and return the premium on the

overplus.

Partial loffes are regulated by this principle, that whereas the owner is not fully indemnified, in case of a total lofs, unlefs he covers his property, therefore he should only be indemnified for a partial loss in the fame proportion; and, if it be not fully infured, he is confidered as infurer himfelf, for the part not covered, and must bear a suitable proportion of the lofs. Therefore the value of the property is proved, and the fum required to cover it computed. If that fum be all infured, the underwriters pay the whole damage; if only part be infured, they pay their share, which is computed by the following rule: As the fum which covers the property is to the fum infured, fo is the whole damage to the part for which the infurers are liable. - For example, if the value of the property be 3601, the fum infured 3001, the premium 8 per

IN

Infurance, cent. and abatement 2 per cent.; then the fum which or less than 12; nor is there any difference of contri- Infurance. fhould be infured to cover the property is 400le; and, if damage be fullained to the extent of 2001. the owners will recover 1501.

If a voyage is infured out and home, the premium outward must be considered as part of the value on the homeward property, and the fum necessary to cover it computed accordingly. For example, to infure 1001. out and home, at 5 per cent. each voyage, abatement

2 per cent. we compute thus : 93 · 100 :: L. 100 : L. 107 : 10 : 6, to be infured outward, premium on L. 107:10:6 outwards, at 5 per cent. L. 5:7:6:93:100::L. 105:7:6: L. 113:6s. to be infured home; the premium on

which is L. 5: 13:6; and, if the ship be lost on the

homeward voyage, From the fum infured home I. 112 6 0 Subtract the discount, 2 per cent.

Sum for which the infurers are liable L. III - 0 Infurance out L.5 7 6 Infurance home 5 13 3

Covered property I. 100 - - II. INSURANCE against Fire. There are several offices in Britain for this purpose, of which the fun fire-office is the most considerable. Infurances are divided into common, hazardous, and doubly hazardous, according to the nature of the subject infured. When the sum infured is high, there is a higher premium per cent. demanded; and money, papers, jewels, pictures, and gun-powder, are not comprehended. If a subject be wrong described, in order that it may be insured at a lower premium, the policy is void. The benefit of a policy is transferred, by indorfement, to the reprefentatives of the person in whose favour it was made; and it may be transferred to other houses when the infured changes his habitation. If infurance be made on the same subject in different offices, it must be specified, by indorfement, on the policy; and, in cafe of loss, the offices pay proportionally. The infurers pay all expences in attempting to extinguish fire, or fave goods, though not successful. If the value of a fubject be infured in part, and damage be fustained, the infurers pay the whole, if it does not exceed the fum infured.

III. INSURANCE of Debts. See BOTTOMRY.

IV. In virtue of INSURANCE for Lives, when the perfon dies, a fum of money becomes payable to the perfon on whose behalf the policy of insurance was granted. One of the principal infurance-offices of this kind, is that of the amicable fociety for a perpetual affurance, kept in Serjeant's inn, Fleet-street, London.

This Society at Serjeant's inn requires an annual payment of 5 L from every member during life, payable quarterly. The whole annual income hence arifing is equally divided among the nominees, or heirs, of fuch members as die every year; and this renders the dividends among the nominees, in different years, more or less, according to the number of members who have happened to die in those years. But this fociety engages that the dividends shall not be less than 150l. to each claimant, though they may be more.-None are admitted whose ages are greater than 45, of proposals which had been made, and lectures recom-VOL. IX. Part I.

bution allowed on account of difference of age. - This fociet has fubfifted ever fince 1706, and its credit and ulefulness are well established. Its plan, however, is liable to several objections. First, it is evident, that regulating the dividends among the nominees, by the number of members who die every year, is not equitable; because it makes the benefit which a member is to receive to depend, not on the value of his contribution, but on a contingency; that is, the number of members that shall happen to die the same year with him. Secondly, its requiring the fame payments from all persons under 45, is also not equitable; for the payment of a person admitted at 12, ought not to be more than half the payment of a person admitted at 45. Thirdly, its plan is fo narrow, as to confine its usefulness too much. It can be of no fervice to any person whose age exceeds 45. It is, likewife, by no means properly adapted to the circumflances of persons who want to make affurances on their lives for only one year, or a short term of years. For example : the true value of the affurance of 1501. 11 - 9 for five years, on the life of a person whose age is 39, may be found, by the first rule, to be nearly three guineas per ann supposing interest at 3 per cent. and the probability of the duration of human life, as they are given in Dr Halley's Table of Observations. But fuch an affurance could not be made in this fociety without an annual payment of 51. Neither is the plan of this feciety at all adapted to the circumflances of persons who want to make affurances on particular furvivorships. For example: a person posfeffed of an estate or falary, which must be lost with his life, has a person dependent upon him, for whom he defires to fecure a fum of money payable at his death. But he defires this only as a fecurity against the danger of his dying first, and leaving a wife, or a parent, without support. In these circumstances he enters himself into this fociety; and, by an annual payment of 51. intitles his nominee at his death to 1501. In a few years, perhaps, his nominee happens to die; and having then loft the advantages he had in view, he determines to forfeit his former payments, and to withdraw from the fociety. The right method, in this case, would have been to have taken from fuch a person the true value of the sum affured, " on the fupposition of non-payment, provided he should furvive." In this way he would have chosen to contract with the fociety: and had he done this, he would have paid for the affurance (supposing interest at 3 per cent. his age 30, the age of his nominee 30, and the values of lives as given by M. De Moivre) 31. 8 s. in an-

> the life of his nominee. None of these objections are applicable to the plan of the fociety which meets at Black Friars bridge, and which has juffly flyled itself the Equitable Society for Affurances on Lives and Survivor bips. The buliness transacted by this society is so extensive, and it is governed fo entirely by calculations, founded on the best reles and observations, that it cannot but prove one of the greatest public benefits.

nual payments, to begin immediately, and to be con-

tinued during the joint duration of his own life, and

It was established in the year 1762, in consequence Mm mending

Infurance mending fuch a defign, which had been read by Mr Dodfon, the author of the Mathematical Repolitory. It affures any fums or reversionary annuities, on any life or lives for any number of years, as well as for the whole continuance of the lives; and in any manner that may be belt adapted to the views of the persons on Reversionary Payments; and the refult has been, affured: that is, either by making the affured fums payable certainly at the failure of any given lives; or on condition of furvivorship; and also, either by ta- cording to the tables for London, from which the calking the price of the affurance in one prefent payment, or in annual payment, during any fingle or joint lives, or any terms, lefs than the whole possible duration of the lives. Any perfons, for inflance, who depend on incomes which must be lost when they die, or who are only tenants for life in chates, may, if they want to borrow money, be enabled to give fufficient fecurity, above what is necessary to enable it to make good all by affuring fuch fums as they want to borrow in this fociety, and affigning the policy; in confequence of which, the lender will, during the term of the affurance, be guarded against ail danger of losing his principal by the death of the borrower. In the fame way, clergymen, counsellors, persons holding any places of profit, traders, and others, who have families, whofe fub frence depends on the continuance of their lives, may here be enabled to make fome provision for their families after their decease. All persons who enjoy annuities for the lives of others, may here fecure themfelves against the loss they would fustain, should they furvive the persons on whose lives the annuities depend, by making affurances which should intitle them to any fums, payable on condition their furvivorship should take place. Any perfon intitled to an estate, annuity, legacy, or office, after another perfon, provided he furvives, may here fecure fome equivalent for his family at his decease, provided he does not furvive .-Husbands may, in this fociety, fecure annuities for mathematicians are qualified to conduct it. The intheir wives, provided they should leave them widows. Parents, by affuring the lives of their children when infants, till they attain a given age, may secure for finefs so advantageous, as to induce the ablest mathethem, should they live to that age, fuch fums as may maticians to accept them; and this will render it the be necessary to put them out to apprenticeships, or to more necessary for the fociety to take care, on any make capitals or fortunes for them, with which to fet future vacancies, to pay no regard in filling them up. out in business, or to marry. Any perfons, apprehen- to any other considerations than the ability and intefive of being left without support in old age, when in- grity of the candidates. The confequence of granting capable of labour, may, in this fociety, purchase an good pay will be a multitude of solicitations on every annuity, to commence at any future year of his life, vacancy, from persons who, however unqualified, will and to continue during the remainder of his life; and hope for fuccels from their connections, and the intehe may do this at a very small expence, if he is young, rest they are able to make; and should the fociety, in and willing to wait for the commencement of his an- any future time, be led by fuch causes to trust its businuity till he is 55 or 60 years of age.

cent, and from tables of the probabilities and values of be fure of receiving just answers. lives in London, where (as in all great towns) the rate of human mortality is much greater than it is in common among mankind.

This fociety has lately made a particular inquiry Infurance. into its own flate, as to profit and lofs, by all the bufinels it has tranfacted from its first institution. This inquiry was made in three different methods, propofed to the directors by Dr Price, the author of the Preatife that it appears, that a much fmaller proportion of the persons affured have died than should have died, acculations have been made, or even according to Dr Halley's table for Breslaw; that, for this reason, the claims have been much lefs than they fould have been: and that the fociety has for many years been enjoying . an income fome thousands per annum greater than it wants, and a furplus flock of near L. 40,000, over and its engagements.

In thefe circumstances, the society finding itself well fecured against future hazards, and being unwilling to take from the public an extravagant profit. have determined to reduce all the future payments for affurances one-tenth; and also to return to the persons now affured one-tenth of all the payments which they have made. And there is, it feems, reason to expect, that this will be only a preparation for farther reductions. Nor need the public, we are informed, be apprehensive of their going too far in making reductions; for in confequence of the inquiry they have lately made, and of the order into which this inquiry has thrown their accounts, they will have it in their power to determine exactly from year to year what they are able to do, and always to keep under their view a clear

flate of their own circumstances.

From the preceding account of this fociety it is manifest, that its business is such, that none but skilful terest of the society therefore absolutely requires, that it should make the places of those who manage its bunels in the hands of persons not possessed of sufficient In short, there are no kinds of affurances on lives ability, as calculators and mathematicians, such mittakes and furvivorships, which this fociety does not make. may be committed as may prove in the highest degree In doing this, it follows the rules which have been detrimental. We have reason to know, that at pregiven by the best mathematical writers on the doctrine fent the fociety is in no danger of this kind; and oneof life annuities and reversions, particularly Mr Simpson: of the great public advantages attending it is, that it and, in order to gain fuch a profit as may render it a has established an office, where not only the business we permanent benefit to the public, and enable it to bear have deferibed is transacted with faithfuluefs and skill; the expences of management, it takes the advantage of but where also all who want solutions of any questions making its calculations at fo low an interest as 3 per relating to life annuities and reversions may apply, and Intelect.

TABLE of the Rates of Affurance on Single Lives in
the Society for equitable Affurances near Black-

Sum affured L. 100.

		Ou	III a	ixux	u. L.				
Age.	One year.			Seven years at an annual			For the whole life, at an an nual payment of		
	f.	s.	d.	£.	s.	d.	£.	5.	d.
10	T	9	6	I	10	7	2	2	10
15	I	11	0	1	12	7	2	6	6
20	T	13	11	I	16 -	0	2	12	10
25	1	17	7	2	0	2	3	0	6
.30	2	2	6	2	6	0	3	8	11
35	2	8	7	2	14.	2	3	17	9
40	2	10	2	3	5	T	4	7	11
45	3	11	0	3	18	6	5	0	0
50	4	4	8	4	II	2	5	12	11
55	5	0	9	5	II	7	6	9	3
60	5	19	1	6	16	IO	7	17	7
65	7	0	II	8	13	0	10	3	9

These rates are 10 per cont lower than the true values, according to the decrements of life in London, reckoning interest at 3 per cont; but at the same time, for all ages under 50, they are near a bird higher than all the true values, according to Dr Halley's Table of the decrements of life at Brellaw, and Dr Price's Tables of the decrements of life at Northamp ton and Norwich.—As therefore this fociety has lately found, that the decrements of life among its members have hitherto been lower than even those given in these last Tables, it may be reasonably expected, that they will in time reduce their rates of assurance to the true values by these tables.

Re-INSURANCE is a fecond contract, made by an influrer, to transfer the rift he has engaged for to another. It is in general forbidden by 19 Geo. II. c. 37. but is permitted to the reprefentatives of an influrer in cafe of his death, or to his affignees in cafe of his bankruptcy; and it must be mentioned in the policy that it is a re-infurance.

INTAGLIOS, precious stones on which are engraved the heads of great men, inscriptions, and the like; such as we frequently see set in rings, seals, &c.

INTEGER, in arithmetic, a whole number, in con-

IN TEGRAL, or INTEGRANT, in philosophy, appellations given to parts of bodies which are of a fimilar nature with the whole: thus filings of iron have the same nature and properties as bars of iron.

Bodies may be reduced into their integrant parts by triture or grinding, limation or filing, folution, amal-

gation, &c. See Grinding, &c.
INTEGUMENT, in anatomy, denote the common coverings which invest the body; as the cuticula,

cutis, &c. Ser Anatomy.

INTEGUMENT is also extended to the particular membranes which invest certain parts of the body; as the coats or tunies of the eye.

INTELLECT, a term used among philosophers, to figuify that faculty of the soul usually called the understanding. See Logic and Metaphysics,

INTENDANT, one who has the conduct, inspection, and management, of any thing. See Superintercatian

This is a title frequent among the French: they have intendants of the marine, who are officers in the feaports, whole bufnefs it is to take care the ordinances and regulations relating to fea-affairs be observed: intendants of the finances, who have the direction of the revenues: intendants of provinces, who are appointed by the king to take care of the administration of jultice, policy, and finances in the provinces: also intendants of buildings, of boules, &cc.

INTENDMENT, in law, is the intention, defign, or true meaning, of a person or thing, which frequently supplies what is not fully expressed but though the intent of parties in deeds and contracts is much regarded by the law, yet it cannot take place against the rules of law.

INTERDMENT of Crimes; this, in case of treason, when the intention is proved by circumflances, is punishable in the same manner as if it was put in execution. So, if a person enter a house in the night time, with an intent to commit burglary, it is felony; also, an assault, with an intent to commit a robbery on the highway is made selony, and punished with transportation, 7 Geo. II. c. 21.

INTENT, in the civil law, fignifies to begin, or commence, an action or process.

INTENTION, in medicine, that judgment or method of cure which a physician forms to himself from a due examination of symptoms.

INTENTION, in physics, the increase of the power or energy of any quality; as heat, cold. &c. by which it stands opposed to remission, which figuises its decrease or diminution.

INTENTION, in metaphyfics, denotes an exection of the intellectual faculties with more than ordinary vigour; when the mind with carnethness fixes its view on any idea, confiders it on all fides, and will not be called off by any folicitation.

INTERAMNA (anc. geog.), fo called from its fituation between rivers, or in an illand in the river Nar; a town of the Cifalpennine Umbria. Interannates the people; furnamed Nartes by Pliny, to diffinguith them from the people of other Interannae. Now Terni; a town in the Pope's territory in Umbria, E. Long, 13, 38. N List, 42, 40.

INTERAMNA, a town and colony of the Volici in Latium, on the confines of Samnium, at the confluence of the rivers Liris and Melpis; and for diffunction fake called *Lirinas*. The town is now in ruins.

INTERAMNA, or Interamnia Pratutianorum (Ptolemy); a town in the territory of the Prætutiani, a part of the Picenum. Now Teramo, in the Abruzzo of Naples.

E. Long, 15. N. Lat. 42. 40.

INTERCALARY, an appellation given to the odd day inferted in leap-year; which was fo called from calo, calare, "to proclaim," it being proclaimed by the priefls with a loud voice.

INTERCATIA (anc. geog.), a town of the Vacczi in the Hither Spain. Here Scipio Æmilianus flew a champion of the barbarians in fingle combat; and was the first who mounted the wall in taking the town. It was fituated to the fouth-east of Asturica; now faid to be in ruins.

Mm 2

Interocffion Intered.

INTERCESSION (interceffio), was used in ancient make it breed money is preposterous, and a perversion intercet. Rome, for the act of a tribune of the people, or other magistrate, by which he inhibited the acts of other magistrates; or even, in case of the tribunes, the decrees of the fenate. Veto was the folemn word used by the tribunes when they inhibited any decree of the fenate or law proposed to the people. The general law of these intercessions was, that any magistrate might inhibit the acts of his equal or inferior; but the tribunes had the fole prerogative of controlling the acts of every other magistrate, yet could not be controlled themselves by anv.

INTERCESSOR (from inter and cede " I go between"), a person who prays, expostulates, or intercedes, in behalf of another. In the Roman law, interceffor was the name of an officer, whom the governors of provinces appointed principally to raife taxes

and other duties.

INTERCESSOR is also a term heretofore applied to fuch bishops as, during the vacancy of a fee, adminiflered the bishoprick, till a successor to the deceased bishop had been elected. The third council of Carthage calls thefe interventors.

INTERCOLUMNIATION, in architecture, denotes the space between two columns, which is always to be proportioned to the height and bulk of the co-

INTERCOSTAL, in anatomy, an appellation given to fuch mufcles, nerves, arteries, and veins, as lie

between the ribs.

INTERDICT, an ecclefiaffical censure, by which the church of Rome forbids the performance of divine fervice in a kingdom, province, town, &c. This cenfure has been frequently executed in France, Italy, and Germany; and in the year 1170, pope Alexander III. put all England under an interdict, forbidding the clergy to perform any part of divine service, except baptifing of infants, taking confeshons, and giving abfoliation to dying penitents. But this centure being liable to the ill consequences of promoting libertinism and a neglect of religion, the fucceeding popes have very feldom made use of it.

There was also an interdict of persons, who were deprived of the benefit of attending on divine fervice. Particular persons were also anciently interdicted of fire and water, which fignified a banishment for some particular offence: by their censure no person was allow ed to receive them, or allow them fire or water; and being thus wholly deprived of the two necessary elements of life, they were doubtless under a kind of ci-

vil death.

INTEREST, is the premium or money paid for the loan or use of other money. See ARITHMETIC,

B° 20.

Many good and learned men have in former times very much perplexed themselves and other people by raifing doubts about the legality of interest in fore conscientia. It may not be amis here to inquire upon what grounds this matter does really stand.

The enemies to interest in general make no distinction between that and usury, holding any increase of money to be indefenfibly usurious. And this they ground as well on the prohibition of it by the law of Mofes among the Jews, as also upon what is laid down by Aristotle, That money is naturally barren; and to

of the end of its inflitution, which was only to ferve the purposes of exchange, and not of increase. Hence the school-divines have branded the practice of taking interest, as being contrary to the divine law both natural and revealed; and the canon law has prefcribed the taking any the least increase for the loan of money as a mortal fin.

But, in answer to this, it may be observed, that the Mofnical precept was clearly a political, and not a moral, precept. It only prohibited the lews from taking usury from their brethren the Jews; but in exprefs words permitted them to take it of a ftranger: which proves that the taking of moderate nfury, or a reward for the nie, for to the word fignifies, is not mahim in fe, fince it was allowed where any but an Ifraelite was concerned. And as to Ariftotle's reafon, deduced from the natural barrenness of money, the fame may with equal force be alleged of houses, which never breed houses; and twenty other things, which nobody doubts it is lawful to make profit of, by letting them to hire. And though money was originally used only for the purposes of exchange, yet the laws of any flate may be well justified in permitting it to be turned to the purposes of profit, if the convenience of fociety (the great end for which money was invented). shall require it. And that the allowance of moderate interest tends greatly to the benefit of the public, especially in a trading country, will appear from that generally acknowledged principle, that commerce cannot subfift without mutual and extensive credit. Unless money therefore can be borrowed, trade cannot be carried on; and if no premium were allowed for the hire of money, few perfons would care to lend it; or at least the ease of borrowing at a short warning (which is the life of commerce) would be entirely at an end. Thus, in the dark ages of monkish superstition and civil tyranny, when interest was laid under a total interdict, commerce was also at its lowest ebb, and fell entirely into the hands of the Jews and Lombards: but when mens minds began to be more enlarged, when true religion and real liberty revived, commerce grew again into credit; and again introduced with itself its inseparable companion, the doctrine of loans upon in-

And, really, confidered abstractedly from this its use, fince all other conveniences of life may be either bought or hired, but money can only be hired, there feems no greater impropriety in taking a recompence or price for the hire of this, than of any other convenience. If one borrow 100 l. to employ in a beneficial trade, it is but equitable that the lender should have a proportion of the gains. To demand an exorbitant price is equally contrary to conscience, for the loan of a horse, or the loan of a sum of money : but a reasonable equivalent for the temporary inconvenience which the owner may feel by the want of it, and for the hazard of his lofing it entirely, is not more immoral in one case than it is in the other. And indeed the abfolute prohibition of lending upon any, even moderate interest, introduces the very inconvenience which it feems meant to remedy. The necessity of individuals will make borrowing unavoidable. Without fome profit by law, there will be but few lenders: and those principally bad men, who will break through the law,

nify themselves from the danger of the penalty, by hazard being none at all. making that profit exorbitant. Thus, while all deenpression, than in modern times when money may be foundantia, 2. Of policies of insurance, See Boxeafily had at a low interest. A capital distinction must therefore be made between a moderate and exorbitant profit; to the former of which we usually give the zard, compared together, different nations have at difname of interest, to the latter the truly odious appellation of usury: the former is necessary in every civil flate; if it were but to exclude the latter, which ought never to be tolerated in any well-regulated fociety. For, as the whole of this matter is well fummed up by Grotius, " if the compensation allowed by law does not exceed the proportion of the hazard run, or the want felt, by the loan, its allowance is neither repugnant to the revealed nor to the natural law : but if it exceeds those bounds, it is then oppressive usury; andthough the municipal laws may give it impunity, they

never can make it just." We see, that the exorbitance or moderation of interest, for the money lent, depends upon two circumstances; the inconvenience of 'parting with it for the prefent, and the hazard of lofing it entirely. The inconvenience to individual lenders can never be estimated by laws; the rate therefore of general interest must depend upon the usual or general interestence. This refults entirely from the quantity of specie or current money in the kingdom; for, the more specie there is circulating in any nation, the greater superfluity there will be, beyond what is necessary to carry on the bufinels of exchange and the common concerns of life. In every nation, or public community, there is a certain quantity of money thus necessary; which a person well skilled in political arithmetic might perhaps calculate as exactly, as a private banker can the demand for run. ning cash in his own shop; all above this necessary quantity may be spared, or lent, without much inconvenience to the respective lenders; and the greater this national superfluity is, the more numerous will be the lenders, and the lower ought the rate of the national interest to be : but where there is not enough, or barely enough, circulating cash, to answer the ordinary uses of the public, interest will be proportionably high; for lenders will be but few, as few can submit to the inconvenience of lending.

So also the hazard of an entire loss has its weight in the regulation of interest: hence, the hetter the fecurity, the lower will the interest be; the rate of interest being generally in a compound ratio, formed out of the inconvenience and the hazard. And as, if there were no inconvenience, there should be no interest but what is equivalent to the hazard; fo, if there were no hazard, there ought to be no interest, fave only what arises from the mere inconvenience of lending. Thus, if the quantity of specie in a nation be such, that the general inconvenience of lending for a year is computed to amount to three per cent. a man that has money by him will perhaps lend it upon good perfonal fecurity at five per cent. allowing two for the hazard run; he will lend it upon landed fecurity, or mortgage, at four per cent the hazard being proportionably less;

Treeselt. and take a profit; and then will endeavour to indem- which all his property depends, at three per tent. the Interest

But fometimes the hazard may be greater than the grees of profit were discountenanced, we find more rate of interest allowed by law will compensate. And complaints of usury, and more flagrant instances of this gives rife to the practice, 1. Of bottomry, or re-

> TOMRY, and INSURANCE. Upon the two principles of inconvenience and haferent times established different rates of interest. The Romans at one time allowed centiffine, one per cent. monthly, or twelve per cent. per annum, to be taken for common loans; but Justinian reduced it to trientes, or one third of the as or centissime, that is, four per cent.; but allowed higher interest to be taken of merchants. because there the hazard was greater. So too Grotius informs us, that in Holland the rate of interest was then eight per cent. in common loans, but twelve to merchants. Our law ettablishes one standard for all alike, where the pledge or fecurity itself is not put in jeopardy; left, under the general pretence of vague and indeterminate hazards, a door should be opened to fraud and usury : leaving specific hazards to be provided against by specific infurances, or by loans upon respondentia or bottomry. But as to the rate of legal interest, it has varied and decreased for 200 years past, according as the quantity of specie in the kingdom has increased by accessions of trade, the introduction of paper-credit, and other circumstances. The statute 37 Hen. VIII. c. g. confined interest to ten per cent. and fo did the statute 13 Eliz. c. 8. But as, through the encouragements given in her reign to commerce, the nation grew more wealthy; fo, under her fucceffor, the statute 2! Jac. 1. c. 17. reduced it to eight per cent.; as did the statute 12 Car. II. c. 13. to fix: and lattly, by the flatute 12 Ann. it. 2. c. 16. it was brought down to five per cent. yearly, which is now the extremity of legal interest that can be taken. But yet, if a contract which carries interest be made in a foreign country, our courts will direct the payment of interest according to the law of that country in which the contract was made. Thus Irifh, American, Turkish, and Indian interest, have been allowed in our courts to the amount of even 12 per cent. For the moderation or exorbitance of interest depends upon local circumitances; and the refusal to enforce such contracts would put a stop to all foreign trade. And, by stat. 14 Geo. III. c. 79. all mortages and other fecurities upon estates or other property in Ireland or the plantations, bearing interest not exceeding six per cent. shall be legal; though executed in the kingdom of Great Britain: unless the money lent shall be known at the time to exceed the value of the thing in pledges in which case also, to prevent usurious contracts at home under colour of fuch foreign fecurities, the borrower shall forfeit treble the sum so borrowed.

INTERJECTION, in grammar, an indeclinable part of speech, fignifying some passion or emotion of the mind. See GRAMMAR.

INTERIM, a name given to a formulary, or kind. of confession of the articles of faith, obtruded uponthe Protestants after Luther's death by the emperor Charles V. when he had defeated their forces; fo called but he will lend it to the flate, on the maintenance of because it was only to take place in the interim (mean : Interlocu time) till a general council should have decided all manes or dead, and the third men. points in dispute between the Protestants and Roma-Interment nifts. It retained most of the doctrines and ceremonies of the Romanists, excepting that of marriage, which was allowed to the clergy, and communion to the laity under both kinds. Most of the Protestants rejected it. There were two other interims; one of Leiplic, the other of Franconia.

INTERLOCUTOR, in Scots law, The fentence or indoment of a court of law, is commonly called an

INTERLOCUTORY decree, in English law. In a fuit in equity, if any matter of fact be strongly controverted, the fact is usually directed to be tried at the bar of the court of king's bench, or at the affizes, upon a feigned iffue. If a question of mere law arises in the course of a cause, it is the practice of the court of chancery to refer it to the opinion of the judges of the court of king's bench, upon a cafe stated for that purpofe. In fuch cases, interlocutory decrees or orders are made.

INTERLOCUTORY Judgments are fuch as are given in the middle of a cause, upon some plea, proceeding on default, which is only intermediate, and does not finally determine or complete the fuit. But the interlocutory judgments most usually spoken of, are those incomplete judgments, whereby the right of the plaintiff is elfablished, but the quantum of damages fustained by him is not afcertained, which is the province of a jury. In fuch a case a writ of inquiry issues to the theriff, who furntons a jury, enquires of the damages, and returns to the court the inquifition fo taken, whereupon the plaintiff's attorney taxes cofts, and figns final

INTERLOCUTORY Order, that which decides not the caufe, but only fettles fome intervening matter relating to the cause. As, where an order is made in chancery, for the plaintiff to have an injunction, to quit possesfion till the hearing of the cause; this order, not being final, is called interlocutory.

INTERLOPERS, are properly those who, without due authority, hinder the trade of a company or corporation lawfully established, by dealing in the same

INTERLUDE, an entertainment exhibited on the theatre between the acts of a play, to amuse the spectators while the actors take breath and shift their dress, or to give time for changing the scenes and decora-

In the ancient tragedy, the chorus fung the inter-Judes, to flow the intervals between the acts.

Interludes, among us, ufually confift of fongs, dances, feats of activity, concerts of mulie, &c.

Aristotle and Horace give it for a rule, that the interludes should confist of fongs built on the principal parts of the drama; but fince the chorus has been laid down, dancers, buffoons, &c. ordinarily furnish the interludes.

INTERMENT, the act of interring, i. e. burying or laying a deceafed perfon in the ground.

Aristotle afferted, that it was more just to affist the dead than the living. Plato, in his Republic, does not forget, amongst other parts of justice, that which concerns the dead. Cicero establishes three kinds of juffice; the first respects the gods, the second the down the funeral pile. A kind of murmur on this a-

Thefe princi- Interment. ples feem to be drawn from nature; and they annear at least to be necessary for the support of society, fince at all times civilized nations have taken care to bury their dead, and to pay their last respects to them. See BURIAL.

We find in history feveral traces of the respect which the Indians, the Egyptians, and the Syrians entertained for the dead. The Syrians embalmed their bodies with myrrh, aloes, honey, falt, wax, bitumen, and refinous gums; they dried them also with the smoke of the fir and the pine tree. The Egyptians preferved theirs with the refin of the cedar, with aromatic spices, and with falt. These people often keep such mummies, or at leaft their effigies, in their houses, and at grand entertainments they were introduced, that by reciting the great actions of their ancestors they might be better excited to virtue. See FUNERAL Rites.

The Greeks, at first, had probably not the same veneration for the dead as the Egyptians. Empedocles, therefore, in the eighty-fourth Olympiad, reflored to life Ponthia, a woman of Agrigentum, who was about to be interred *. But this people, in proportion as they Diogenes grew civilized, becoming more enlightened, perceived Lacrius de

the necessity of establishing laws for the protection of At Athens the law required that no person should lib. 8.

be interred before the third day; and in the greater part of the cities of Greece a funeral did not take place till the fixth or feventli. When a man appeared to have breathed his laft, his body was generally washed by his nearest relations, with warm water mixed with wine. They afterwards anointed it with oil; and covered it with a drefs, commonly made of fine linen. according to the custom of the Egyptians. This drefs was white at Messina, Athens, and in the greater part of the cities of Greece, where the dead body was crowned with flowers At Sparta it was of a purple colour, and the body was furrounded with olive leaves. The body was afterwards laid upon a couch in the entry of the house, where it remained till the time of the funeral. At the magnificent obsequies with which Alexander honoured Hepheltion, the body was not burned until the tenth day.

The Romans, in the infancy of their empire, paid as little attention to their dead as the Greeks had done. Acilius Aviola having fallen into a lethargic fit, was fupposed to be dead; he was therefore carried to the funeral pile the fire was lighted up; and though he cried out he was still alive, he perished for want of speedy assistance. The Prætor Lamia met with the fame fate. Tubero, who had been Prætor, was faved from the funeral pile. Asclepiades a physician, who lived in the time of Pompey the Great, about one hundred and twenty years before the Christian æra, returning from his country-house, observed near the walls of Rome a grand convoy and a crowd of people, who were in mourning affitting at a funeral, and showing every exterior fign of the deepest grief. Having asked what was the occasion of this intercourse, no one made any reply. He therefore approached the pretended dead body; and imagining that he perceived tigns of life in it, he ordered the byltanders to take away the flambeaux, to extinguish the fire, and to pull

refe

Interment role throughout the whole company. Some faid that wash the bodies of their dead before interment; and interment. they ought to believe the physician, while others turned both him and his profession into ridicule. The relations, however, yielded at length to the remonstrances. of Aselepiades; they confented to defer the obsequies

for a little; and the confequence was, the reftoration of the pretended dead person to life. It appears that these examples, and several others of the like nature, induced the Romans to delay funerals longer, and to

enact laws to prevent precipitate interments.

At Rome, after allowing a fufficient time for mourning, the nearest relation generally closed the eyes of the deceased; and the body was bathed with warm water, either to render it fitter for being anointed with oil, or to reanimate the principle of life, which might remain suspended without manifesting itself. Proofs were afterwards made, to discover whether the perion was really dead, which were often repeated during the time that the body remained exposed; for there were persons appointed to visit the dead, and to prove their washed a second time, it was anointed with oil and of foreign perfumes for this purpose, that under the confulfhip of Licinius Craffus and Julius Cæfar, the fenate forbade any perfumes to be used except such as were the production of Italy. On the third day the body was clothed according to its dignity and condition. The robe called the prætexta was put upon magistrates, and a purple robe upon confuls; for conquerors, who had merited triumphal honours, this robe was of gold tiffue. For other Romans it was white, and black for the lower classes of the people. These dresses were often prepared at a distance, by the mothers and wives of persons still in life. On the fourth day the body was placed on a couch, and exposed in the vestibule of the house, with the visage turned towards the entrance, and the feet near the door; in this fituation it remained till the end of the week. Near the couch were lighted wax tapers, a fmall box in which perfumes were burnt, and a veffel full of water for purification, with which those who approached the body befprinkled themselves. An old man, belonging to those who furnished every thing domestics clothed in black. On the eighth day the funeral rites were performed; but to prevent the body from corrupting before that time, falt, wax, the refinous gum of the cedar, myrrh, honey, balm, gypfum, lime, afphaltes, or bitumen of Judea, and feveral other substances, were employed. The body was carried to the pile with the face uncovered, unlefs wounds or the nature of the discase had rendered it used, made of a kind of plaster; which has given rife to the expression of funera larvata, used in some of the ancient authors. This was the last method of concealment which Nero made use of, after having caused Germanicus to be poisoned : for the effect of the poilon had become very fenfible by livid spots and the blackness of the body; but a shower of rain happening to fall, it washed the plaster entirely away, and

The Turks have, at all times, been accustomed to

thus the horrid crime of fratricide was discovered.

as their ablutions are complete, and no part of the body escapes the attention of those who assist at such melancholy ceremonies, they can eafily perceive whether one be really dead or alive, by examining, among other methods of proof, whether the fphinder ani has loft its power of contraction. If this mufcle remains fill contracted, they warm the body, and endeavour to recal it to life; otherwise, after having washed it with water and foap, they wipe it with linen cloths, wastr it again with rofe-water and aromatic fubflances, cover it with a rich drefs, put upon its head a cap ornamented with flowers, and extend it upon a carpet placed in the veftibule or hall at the entrance of the

In the primitive church the dead were washed and then anointed; the body was wrapped up in linen, or clothed in a drefs of more or lefs value according to circumstances, and it was not interred until after being exposed and kept fome days in the house. 'The

In other countries, more or lefs care is taken to prevent fudden interments. At Geneva, there are people appointed to inspect all dead bodies. Their duty confilts in examining whether the person be really dead, and whether one died naturally or by violence. In the north, as well as at Genoa, it is ufual not to bury the dead till three days have expired. In generally remain unburied three or four days.

Premature INTERMENT. Notwithstanding the customs above recited; fill, in many places, and on many oca cafions in all places, too much precipitation attends this last office; or if not precipitation, a neglect of due precautions in regard to the body. In general, indeed, the most improper treatment that can be imagined is adopted, and many a perfon made to defcend into the grave before he has fighed his last breath. The histories related by Hildanus, by Camerarius, by Horstius, by Macrobius in his Somnium Scipionis, by Plato in his Republic, by Valerius Maximus, and by a great many modern authors, leave us no doubt respecting the dangers or mifconduct of fuch precipitation. It must appear aftonishing that the attention of mankind has been after all so little roused by an idea the most terrible that can be conceived on this fide of eternity. If nature recoils from the idea of death, with what horror must she start at the thought of death anticipated, precipitated by inattention-a return of life in darkness. diffraction, and despair-then death repeated under agonies unspeakable! To revive nailed up in a coffin! The brain can scarce sustain the reflection in our coolest

According to prefent ufage, as foon as the femblance of death appears; the chamber of the fick is deferted by friends, relatives, and phylicians; and the apparently dead, though frequently living, body, is committed to the management of an ignorant and unfeeling nurse, whose care extends no farther than laying the limbs ftraight, and fecuring her accustomed? perquifites. The bed-cloaths are immediately removed, and the body is exposed to the air. This, when cold,

which, by a different treatment, might have been buried alive. kindled into flame; or it may only continue to reprefs it, and the unhappy person afterwards revive amidst

the horrors of the tomb.

The difference between the end of a weak life and the commencement of death, is fo fmall, and the uncertainty of the figns of the latter is fo well established both by ancient and modern authors who have turned their attention to that important object, that we can fearcely suppose undertakers capable of dikinguishing an apparent from a real death. Animals which fleep during winter show no figns of life; in this case, circulation is only suspended; but were it annihilated, the vital spirit does not so easily lose its action as the other fluids of the body; and the principle of life, which long furvives the appearance of death, may re-animate a body in which the action of all the organs feems to be at an end. But how difficult is it to determine whether this principle may not be revived? It has been found impossible to recal to life fome animals fuffocated by mephitic vapours, tho' they appeared less affected than others who have revived. Coldness, heaviness of the body, a leaden livid colour, with a vellowness in the visage, are all very uncertain figns: Mr Zimmerman observed them all upon the body of a criminal, who fainted through the dread of that punishment which he had merited. He was shaken, dragged about, and turned in the same manner as dead bodies are, without the leaft figns of refiftance; and yet at the end of 24 hours he was recalled to life by means of volatile alkali.

A Director of the coach-office at Dijon, named Colinet, was supposed to be dead, and the news of this event was fpread throughout the whole city. One of his friends, who was defirous of feeing him at the moment when he was about to be buried, having looked at him for a confiderable time, thought he perceived fome remains of fenfibility in the muscles of the face. He therefore made an attempt to bring him to life by he owed to his friend. This remarkable circumstance was much like those of Empedocles and Asclepiades. men of fkill and abilities called in cases of sudden death, in which people of ordinary knowledge are often decei-

ved by falle appearances.

A man may fall into a fyncope, and may remain in that condition three or even eight days. People in this -fituation have been known to come to life when depofited among the dead. A boy belonging to the hofpital at Cassel appeared to have breathed his last : he was carried into the hall where the dead were exposed, and was wrapped up in a piece of canvas. Some time after, recovering from his lethargy, he recollected the place in which he had been deposited, and crawling towards the door knocked against it with his foot. This noise was luckily heard by the centinel, who soon perceiving the motion of the canvas called for affiftance. The youth was immediately conveyed to a warm bed, and foon perfectly recovered. Had his body been confined by close bandages or ligatures, he would not have been able, in all probability, to make himfelf be heard: his unavailing efforts would have made him was to have been regularly complied with by her rela-

Enterment, must extinguish any spark of life that may remain, and again sall into a syncope, and he would have been thus interments

We must not be astonished that the servants of an hospital should take a syncope for a real death, since even the most enlightened people have fallen into errors of the same kind. Dr John Schmid relates, that a young girl, seven years of age, after being afflicted for fome weeks with a violent cough, was all of a fudden freed from this troublesome malady, and appeared to be in perfect health. But fome days after, while playing with her companions, this child fell down in an instant as if struck by lightning. A death-like palenefs was diffused over her face and arms; she had no apparent pulse, her temples were funk, and she showed no figns of fensation when shaken or pinched. A phyfician, who was called, and who believed her to be dead, in compliance with the repeated and preffing request of her parents, attempted, though without any hopes, to recal her to life; and at length, after feveral vain efforts, he made the foals of her feet be fmartly rubbed with a brush dipped in strong pickle. At the end of three quarters of an hour fhe was observed to figh; the was then made to fwallow fome foirituous liquor; and the was foon after reftored to life, much to the joy of her disconsolate parents .- A certain man having undertaken a journey, in order to fee his brother, on his arrival at his house found him dead. This news affected him fo much, that it brought on a most dreadful fyncope, and he himfelf was fuppofed to be in the like fituation. After the usual means had been employed to recal him to life, it was agreed that his body should be diffected, to discover the cause of so fudden a death; but the supposed dead person overhearing this propofal, opened his eyes, flarted up, and immediately betook himself to his heels .- Cardinal Efpinola, prime minister to Philip II. was not fo fortunate; for we read in the Memoirs of Amelot de la Houssai, that he put his hand to the knife with which he was opened in order to be embalmed. In short, almost every one knows that Vefalius, the father of fpirituous liquors, in which he fucceeded; and this di- anatomy, having been feut for to open a woman fubrector enjoyed afterwards for a long time that life which ject to hysterics, who was supposed to be dead, he perceived, on making the first incision, by her motion and cries, that she was still alive : that this cir-These inflances would perhaps be more frequent, were cumftance rendered him so odious, that he was obliged to fly; and that he was so much affected by it, that he died foon after .- On this occasion, we cannot forbear to add an event more recent, but no less melancholy. The Abbé Prevoft, fo well known by his writings and the fingularities of his life, was feized with a fit of the apoplexy, in the forcst of Chantilly, on the 23d of October 1763. His body was carried to the nearest village, and the officers of justice were proceeding to open it, when a cry which he fent forth affrightened all the affiftants, and convinced the furgeon that the Abbć was not dead; but it was too late to fave him. as he had already received the mortal wound.

Even in old age, when life feems to have been gradually drawing to a close, the appearances of death are often fallacious. A lady in Cornwall, more than 80 Lond. years of age, who had been a confiderable time decli- vol. 1Va ning, took to her bed, and in a few days feemingly ex- p. 456. pired in the morning. As the had often defired not to be buried till the had been two days dead, her request

Nº 167.

Interment tions. All that faw her looked upon her as dead, and the report was current through the whole place; nay, a gentleman of the town actually wrote to his friend in the island of Scilly that she was deceased. But one of those who were paying the last kind office of humanity to her remains, perceived some warmth about the middle of the back; and acquainting her friends with it, they applied a mirror to her month; but, after repeated trials, could not observe it in the least stained ; her under jaw was likewise fallen, as the common phrase is; and, in short, she had every appearance of a dead person. All this time the had not been ftripped or dreffed; but the windows were opened, as is usual in the chambers of the deceafed. In the evening the heat feemed to increase, and at length she was perceived to

> In fhort, not only the ordinary figns are very uncertain, but we may fay the fame of the stiffness of the limbs, which may be convultive; of the dilation of the pupil of the eye, which may proceed from the fame cause; of putrefaction, which may equally attack some parts of a living body; and of feveral others. Haller, convinced of the uncertainty of all these figns, propofes a new one, which he confiders as infallible. "If the person (fays he) be still in life, the mouth will immediately thut of itself, because the contraction of the muscles of the jaw will awaken their irritability." The jaw, however, may be deprived of its irritability though a man may not be dead. Life is preserved a long time in the passage of the intestines. The fign pointed out by Dr Fothergill appears to deserve more attention. " If the air blown into the mouth (fays this phyfician) paffes freely through all the alimentary channel, it affords a ftrong prefumption that the irritability of the internal fphineters is deffroyed, and confequently that life is at an end." These figns, which deferve to be confirmed by new experiments, are doubtlefs not known to undertakers.

> The difficulty of diffinguishing a person apparently dead from one who is really fo, has, in all countries where bodies have been interred too precipitately, rendered it necessary for the law to assist humanity. Of feveral regulations made on this fubiect, we shall quote only a few of the most recent; such as those of Arras in 1772; of Mantua in 1774; of the Grand Duke of Tufcany in 1775; of the Senechauffée of Sivrai, in Poitou, in 1777; and of the Parliament of Metz in the fame year. To give an 'idea of the reft, it will be fufficient to relate only that of Tufcany. By this edict, the Grand Duke forbids the precipitate interment of persons who die suddenly. He orders the Magistrates of Health to be informed, that phyficians and furgeons may examine the body; that they may use every endeavour to recal it to life, if possible, or to discover the cause of its death; and that they shall make a report of their procedure to a certain tribunal. On this occasion, the Magistrate of Health orders the dead not to be covered until the moment they are about to be buried, except fo far as decency requires; observing always that the body be not closely confined, and that nothing may compress the jugular veins and the carotid arteries. He forbids people to be interred according to the ancient method; and requires that the arms and the hands fhould be left extended, and that they Vol. IX. Part. I.

should not be folded or placed cross-wife upon the Interment, breaft. He forbids, above all, to press the jaws one Intermitagainst the other; or to fill the mouth and nostrils with cotton, or other stuffing. Lastly, he recommends not to cover the vifage with any kind of cloth until the body is deposited in its cossin.

We shall conclude this article by subjoining, from Dr Hawes's Address to the Public on his subject, a few of the cases in which this fallacious appearance of death is most likely to happen, together with the respective modes of treatment which he recommends.

In apoplectic and fainting fits, and in those arising from any violent agitation of mind, and also when opium or spirituous liquors have been taken in too great a quantity, there is reason to believe that the appearance of death has been frequently mistaken for the reality. In these cases, the means recommended by the Humane Society for the Recovery of Drowned Perfons should be persevered in for several hours, and bleeding, which in fimilar circumstances has fometimes proved pernicious, should be used with great caution, (See the article DROWNING.) In the two latter instances it will be highly expedient, with a view of counteracting the foporific effects of opium and spirits, to convey into the stomach, by a proper tube, a solution of tartar emetic, and by various other means to excite

From the number of children carried off by convulfions, and the certainty arifing from undoubted facts, that some who have in appearance died from that cause have been recovered; there is the greatest reafon for concluding, that many, in confequence of this difeafe, have been prematurely numbered among the dead; and that the fond parent, by neglecting the means of recalling life, has often been the guiltless executioner of her own offspring. To prevent the commission of such dreaful mistakes, no child, whose life has been apparently extinguished by convulsions, should be configned to the grave till the means of recovery above recommended in apoplexies, &c. have been tried: and, if possible, under the direction of some skilful practitioner of medicine, who may vary them as circumftances shall require.

When fevers arife in weak habits, or when the cure of them has been principally attempted by means of depletion, the confequent debility is often yery great, and the patient fometimes finks into a flate which bears fo close an affinity to that of death, that there is reason to suspect it has too often deceived the byflanders, and induced them to fend for the undertaker when they should have had recourse to the succours of medicine. In fuch cases, volatiles, eau de luce for example, should be applied to the nose, rubbed on the temples, and sprinkled often about the bed; hot flannels, moistened with a strong foliation of camphorated spirit, may likewise be applied over the breast. and renewed every quarter of an hour; and as foon as the patient is able to fwallow, a tea fpoonful of the strongest cordial should be given every five minutes.

The fame methods may also be used with propriety in the fmall-pox when the pultules fink, and death apparently enfues; and likewife in any other acute difcases, when the vital functions are suspended from a fimilar cause.

INTERMITTENT, or INTERMITTING, Fevers Nn

Interpula- fuch fevers as go off and foon return again, in oppositionic, in which the passion of the speaker introduces a Interrogation to those which are continual See. (the Index sub-Interruga- joined to) MEDICINE.

INTERPOLATION, among critics, denotes a fpurious passage inserted into the writings of some an-

tion.

INTERPOSITION, the fituation of a body between two others, fo as to hide them, or prevent their action.

The eclipse of the fun is occasioned by an interpofition of the moon between the fun and us; and that of the moon by the interpolition of the earth between

the fun and moon. See ECLIPSE. INTERPRETER, a person who explains the thoughts, words, or writings, of fome other, which before were unintelligible.—The word interpres, according to Isidore, is composed of the preposition inter, and partes, as fignifying a person in the middle betwixt two parties, to make them mutually underfland each others thoughts: others derive it from inter, and pres, i. e. fidejuffor; q. d. a person who serves as fecurity between two others who do not understand one another.

There have been great debates about interpreting Scripture. The Romanists contend, that it belongs abfolutely to the church : adding, that where she is filent, reason may be consulted; but where she speaks, reason is to be difregarded. The Protestants generally allow reason the sovereign judge, or enterpreter; tho' fome among them have a strong regard to fynods, and others to the authority of the primitive fathers. Lastly, others have recourse to the Spirit within every person to interpret for them; which is what Bochart calls αποδειξις τη ανιυμαίο

INTERREGNUM, the time during which the throne is vacant in elective kingdoms; for in fuch as are hereditary, like ours, there is no fuch thing as an interregnum.

INTERREX, the magistrate who governs during an interregnum.

This magistrate was established in old Rome, and was almost as ancient as the city itself: after the death of Romulus there was an interregnum of a year, du-

ring which the fenators were each interrex in their turn, five days a piece.

After the establishment of confuls and a commonwealth, though there were no kings, yet the name and function of interrex was still preserved: for, when the magistrates were absent, or there was any irregularity in their election, or they had abdicated, fo that the comitia could not be held; provided they were unwilling to create a dictator, they made an interrex, whose office and authority was to last five days; af-ter which they made another. To the interrex was delegated all the regal and confular authority, and he performed all their functions. He affembled the fenate, held comitia or courts; and took care that the election of magistrates was according to rules. Indeed at first it was not the custom of the interrex to hold comitia, at least we have no instance of it in the Roman history. The patricians alone had the right of electing an interrex; but this office fell with the republic, when the emperors made themselves masters of every thing

INTERROGATION, EROTESIS, a figure of rhe-

thing by way of question, to make its truth more con- tories

The interrogation is a kind of apostrophe which the fpeaker makes to himfelf; and it must be owned, that this figure is fuited to express most passions and emotions of the mind; it serves also to press and bear down an adverfary, and generally adds an uncommon brifkness, action, force, and variety, to discourse.

INTERROGATION, in grammar, is a point which ferves to diftinguish fuch parts of a discourse, where the author speaks as if he were asking questions. Its form

INTERROGATORIES, in law, are particular questions demanded of witnesses brought in to be examined in a cause, especially in the court of chancery, And these interrogatories must be exhibited by the parties in fuit on each fide; which are either direct for the party that produces them, or counter, on behalf of the adverse party; and generally both plaintiff and defendant may exhibit, direct, and counter, or cross interrogatories. They are to be pertinent, and only to the points necessary; and either drawn or perused by counfel, and to be figned by them.

INTERSECTION, in mathematics, the cutting of one line, or plane, by another; or the point or line wherein two lines, or two planes, cut each other.

The mutual interfection of two planes is a right line. The centre of a circle is in the intersection of two diameters. The central point of a regular or irregular figure of four fides, is the point of interfection of the two diagonals.

The equinoxes happen when the fun is in the interfections of the equator and ecliptic.

INTERSPINALES. See ANATOMY, Table of the

Muscles. INTERVAL, the diffance or space between two extremes, either in time or place. The word comes from the Latin intervallum, which, according to Ifia dore, fignifies the space inter fossam & murum, " between the ditch and the wall!" others note, that the flakes or piles, driven into the ground in the ancient Roman bulwarks, were called valla; and the interffices

or vacancy between them, intervalla.

INTERVAL, in music. The distance between any given found and another, strictly speaking, is neither measured by any common standard of extension nor duration; but either by immediate fenfation, or by computing the difference between the numbers of vibrations produced by two or more fonorous bodies, in the act of founding, during the same given time. As the vibrations are flower and fewer during the fame instant, for example, the found is proportionally lower or graver; on the contrary, as during the fame period the vibrations increase in number and velocity, the founds are proportionably higher or more acute. An interval in music, therefore, is properly the difference between the number of vibrations produced by one fonorous body of a certain magnitude and texture, and of those produced by another of a different magnitude and texture in the fame time.

Intervals are divided into confonant and diffonant, A confonant interval is that whose extremes, or whose highest and lowest founds, when simultaneously heard, coalesce in the ear, and produce an agreeable fensation

Interval. called by Lord Kames a tertium quid. A dissonant in- in the same degree by a sharp or a stat, and it only Interval.

terval, on the contrary, is that whose extremes, simul- forms a chromatic interval; its ratio is as 24 to 25. taneously heard, far from coalescing in the ear, and producing one agreeable fensation, are each of them plainly diffinguished from the other, produce a grating effect upon the fense, and repel each other with an irreconcileable hostility. In proportion as the vibrations of different fonorous bodies, or of the fame fonorous body in different modes, more or less frequently coincide during the fame given time, the chords are more or less perfect, and consequently the intervals more or less confonant. When these vibrations never coincide at all in the same given time, the discord is confummate, and confequently the interval absolutely diffonant.

Intervals are not only divided according to their natures, but also with respect to their degrees. In this view, they are either enharmonic, chromatic, or diatonic. Of these therefore in their order, from the least to

the greatest.

An enharmonic interval is what they call the eighth part of a tone, or the difference between a major and minor semitone generally distinguished by the name of a comma. Commas, however, are of three different kinds, as their quantities are more or lefs; but fince these differences cannot be ascertained without long and intricate computations, it is not necessary for us to attempt an investigation, whose pursuit is fo unpleasant, and whose result attended with so little utility. It has by muficians been generally called the eighth part of a tone; but they ought to have confidered, that a comma is by no means the object of auricular perception, and that its estimate can only be formed by calculation. For a more minute disquisition of this matter, our readers may confult the article COMMA in the Mufical Dictionary, or the article Music in this Work, Notes, n and s. A chromatic interval confifts properly of a minor femitone, but may also admit the major. A diatonic interval confifts of a femitone-major at leaft, but may confift of any number of tones within the octave. When an octave higher or lower is affumed, it is obvious that we enter into another scale which is either higher or lower, but still a repetition of the former degrees of found.

Intervals again are either fimple or compound. All the intervals within any one octave are fimple; fuch as the fecond major or minor, the third, the fourth, the fifth, the fixth, the feventh, &c. of thefe afterwards. All intervals whose extremes are contained in different octaves, fuch as the ninth, the tenth, the eleventh, the twelfth, the thirteenth, the fourteenth, the fifteenth,

&c. may be termed compound intervals.

The femitone either exactly or nearly divides the tone into two equal parts. In the theory of harmonical computation three kinds of femitones are recognifed, viz. the greatest, the intermediate, and the smalleft femitone. But in practice, to which these expli- perfect interval, as least susceptible of alteration. The cations are chiefly adapted, the femitone is only di-flinguished into major and minor. The femitone maccluds its extremes. It confifts of two tones major, one jor is the difference between the third major and the minor, and a femitone major, as from A to E afcendfourth, as EF. Its ratio is as 15 to 16, and it forms ing; its ratio is as 2 to 3. the least of all diatonic intervals.

Though fome distinction is made between these semitones by the manner of marking them, yet on the organ and harpfichord no diffinction can be made : nor is there any thing more common for us than to fay, that D fharp in rifing is E flat in descending, and so through the whole diapafon above or below; befides, the femitone is fometimes major and fometimes minor, fometimes diatonic and fometimes chromatic, according to the different modes in which we compose or practise: yet in practice these are called femitones minor, which are marked by fharps or flats, without changing the degree; and femitones major are those which form the interval of a fecond.

With respect to the three semitones recognised in theory, the greatest semitone is the difference between a tone major and a femitone minor; and its ratio is as 25 to 27. The intermediate femitone is the difference between a femitone major and a tone major; and its raito is as 128 to 135. In a word, the small semitone confifts of the difference between the greatest and the intermediate femitone; and its ratio is as 125 to 128.

Of all thefe intervals, there is only the femitone major, which is fometimes admitted as a fecond in har-

The interval of a tone which characterifes the diatonic species of composition, is either major or minor The former confids of the difference between the fourth and fifth; and its ratio is as 8 to 9: and the latter, whose ratio is as 9 to 10, results from the difference between the third minor and the fourth.

Seconds are diftinguished into four kinds: two of which are not in practife sufficiently momentous to be mentioned. The fecond major is fynonymous with the intervals of a tone; but as that tone may be either major or minor, its ratio may be either as 8 to o, or as 9 to 10.

The fecond minor confifts of the distance from B to C, or from EF; and its ratio is as 15 to 16.

The third is fo called, because it consists of two gradations, or three diatonic founds, as from G to B ascending, or from A to C, inclusive of the extremes: of which the first is a third major, composed of two full tones, and its ratio as 4 to 5; the fecond, a third minor confifting of a tone and a semitone major, and its ratio as 5 to 6.

The fourth has by fome been reckoned an imperfect. but more justly by others a perfect, chord. It confifts of three diatonic degrees, but take its name from the four different founds of which it is formed; or, in other words, the number by which it is denominated includes the extremes. It is composed of a tone major, a tone minor, and a femitone major, as from C to F ascending; its ratio as 3 to 4.

The fift, next to the octave, is, perhaps, the most

The fixth is not found among the natural order of The femitone minor confilts of the difference be- confonances, but only admitted by combination. It tween the third major and minor; it may be marked is not here necessary to mention its various distinctions

neral The fixth major confilts of four tones and a femitone major, as from G to E ascending; its ratio is as

3 to 5. The fixth minor contains three tones and two temitones major, as from E to C afcending; its ratio

is as 5 to 8.

The feventh, as a reduplication of the fecond, is a diffonance. When major, is confitts diatonically of five tones, three major, and two minor; and a major femitone, as from C to B afcending; its ratio is as

When minor, it confilts of four tones, three major and one minor, and two major semitones, as from E to

1) afcending: its ratio is as 5 to 0.

The octave is the most perfect of all chords, and in many cases hardly to be distinguished by the ear from an unifon; that is to fay, from that coincidence of found produced by two mufical strings, whose matter, lengths, diameters, and tenfions, are the fame. As the vibrations of two ftrings in unifon during any given time, are precifely coincident; fo whilft the lowest exteme of the octave vibrates once, the higheff vibrates twice; and confequently its ratio is as a to 2, as from c to C afcending. It confifts of fix full tones and two femitones major. Its name is derived from the Latin edo, "eight;" because that number likewise includes its extremes. It may likewise be divided into twelve semitones. It contains the whole diatonic feale; and every feries above or below confifts only of the fame returning founds. From whence the natures, diffances, and powers, of every interval greater than the octave, as the ninth, the tenth, the eleventh, the twelfth, the thirteenth, the fourteenth, the fifteenth, the triple octave, &c. may eafily be computed.

During our past observations upon the term interval, we have either wholly neglected our faithful affociate M. Rousseau, or only maintained a distant and momentary intercourse with him. We now propose to pay him a more permanent and familiar vifit; but as he is engaged in the dispute between the Pythagoreans and Aristoxenians, we think it more advantageous to decline the controverfy, and to follow him, after having efcaped the fray, like a gentleman and a scholar. Having put the partizans of Aristoxenus to filence, let us, with him, forfake the lifts of combat, nor flain his triumph by infulting the falling cham-

"We divide (fays he) as did the ancients, intervals into confonant and diffonant. The confonances are perfect or imperfect *; dissonances are either fuch by nature, or become fuch by accident. There are only two intervals naturally diffonant, viz, the fecond and feventh, including their octaves or replications; nay, still these two may be reduced to one alone, as the feventh is properly no more than a replication of the second; for B, the seventh above the lowest C, where we have generally begun the fcale, is really an octave above B, the note immediately below that C; and confequently the interval between thefe lower founds is no more than that of a fecond major, to which all diffonances may therefore be ultimately reduced, whether confidered as major or minor; but

cident. See Discord.

" Besides, every interval is either simple or reduplicated. Simple intervals are fuch as the limits of a fingle octave comprehend. Every interval which furpasses this extent is reduplicated; that is to fay, compounded of one or more octaves, and of the simple interval whose replication it is.

" Simple intervals are likewife divided into direct and inverted. Take any timple interval whatever for a direct one; the quantity which, added to itfelf, is required to complete the offave, will be found an inverted interval; and the same observation holds recipro-

cally true of fuch as are inverted.

"There are only fix kinds of fimple intervals; of which three contain fuch quantities, as, added to the other three, are required to complete the octave i and of confequence likewife the one must be inverfions of the other. If you take at first the smallest intervals, you will have, in the order of direct intervals, the fecond, the third, and fourth; for inverted, the feventh, the fixth, and fifth. Suppose these to be disect, the others will be inverted; every thing here is reciprocal.

" To find the name of any interval whatever, it is only necessary to add the denomination of unity to the degree which it contains. Thus the interval of one degree shall give a second; of two, a third; of three, a fourth; of feven, an octave; of nine, a tenth, &c. But this is not sufficient to determine an interval with accuracy; for under the fame name it may be either major or minor, true or false, diminished or redun-

" The confonances which are imperfect, and the two natural diffonances, may be major or minor: which, without changing their degree, occasions in the interval the difference of a femitone; fo that if, from a minor interval, we fill deduce a femitone, it becomes an interval diminished; if, by a semitone, we increase a major interval, it becomes an interval redundant.

" The perfect confonances are by their nature invariable. When their intervals are fuch as they ought to be, we call them just, true: and if we dilate or contract this interval by a femitone, the confonance is termed false, and becomes a diffonance; redundant, if the semitone be added; diminished, if it be abstracted. We improperly give the name of a falle fifth to the fifth diminished; this is taking the genus for the species: the fifth redundant is every jot as false as the diminished, it is even more fo in every respect."

In the Mufical Dictionary, plate C, fig. 2. may be feen a table of all the simple intervals practicable in music, with their names, their degrees, their values

and their ratios.

Having afcertained the distinction between major and minor intervals, it is only necessary to add, that thefe may be natural or artificial. Of the natural we have already given fome account, by afcertaining the distances and ratios of such as have been mentioned. Of the artificial, we may observe, that they are such as change their position from what it naturally is in the diatonic fcale, to what the conveniency of composition or transposition requires it to be. A note thus

See Confonance.

Intrioue.

Intellate thus artificially heightened by a femitone, together the hero for the execution of his defign, and the ef- intrigue with the character which expresses that elevation, is called a fbarb; on the contrary, a note artificially depreffed by a femitone, together with the character by which that depression is fignified, is called a flat. The character which reftores a note thus depressed or raised to its primary flate, is called a natural. Major or minor intervals, as they prevail, characterife the major or minor mode. See Mode.

INTESTATE, in law, a person that dies without

making a will.

INTESTINA, in the Linngan System, an order of worms. See Zoology.

INTESTINES, INTESTINA, in anatomy, the guts or bowels; those hollow, membranous, cylindrical parts, extended from the right orifice of the flomach to the agus; by which the chyle is conveyed to the lacteals, and the excrements are voided. See ANA-TOMY, DO 93.

INTONATION, in music, the action of founding the notes in the scale with the voice, or any other given order of musical tones. Intonation may be either true or falfe, either too high or too low, either too fharp or too flat; and then this word intonation, attended with an epithet, must be understood concern-

ing the manner of performing the notes.

In executing an air, to form the founds, and preserve the intervals as they are marked with justness and accuracy, is no inconfiderable difficulty, and scarcely practicable, but by the affistance of one common idea, to which, as to their ultimate test, these founds and intervals must be referred : these common ideas are those of the key, and the mode in which the performer is engaged; and from the word tone, which is fometimes used in a sense almost identical with that of the key, the word intonation may perhaps be derived. It may also be deduced from the word diatonic. as in that scale it is most frequently conversant; a scale which appears most convenient and most natural to the voice. We feel more difficulty in our intonation of fuch intervals as are greater or leffer than those of the diatonic order; because, in the first case, the glottis and vocal organs are modified by gradations too large; or too complex, in the fecond.

INTRENCHMENT, in the military art, any work that fortifies a post against an enemy who attacks. It is generally taken for a ditch or trench with a parapet. Intrenchments are fometimes made of fascines with earth thrown over them, of gabions. hogsheads, or bags filled with earth, to cover the men

from the enemy's fire.

INTRIGUE, an affemblage of events or circumflances, occuring in an affair, and perplexing the perfons concerned in it. In this fenfe, it is used to fignify the nodus or plot of a play or romance; or that point wherein the principal characters are most embarraffed through the artifice and opposition of certain persons, or the unfortunate falling out of certain accidents and circumstances.

In tragedy, comedy, or an epic poem, there are always two defigns. The first and principal is that of the hero of the piece: the fecond contains the defigns of all those who oppose him. These opposite causes produce opposite effects, to wit, the efforts of

forts of those who thwart it. As those causes and defigns are the beginning of the action, so these efforts. are the middle, and there form a knot or difficulty which we call the intrigue, that makes the greatest part of the poem. It lasts as long as the mind of the reader or hearer is suspended about the event of those opposite efforts; the folution or catastrophe commences when the knot begins to unravel and the difficulties and doubts begin to clear up.

The intrigue of the Iliad is twofold. The first comprehends three days fighting in Achilles's absence, and confifts on the one fide in the refillance of Agamemnon and the Greeks, and on the other in the inexorable temper of Achilles. The death of Patroclus unravels this intrigue, and makes the beginning of a fecond. Achilles refolves to be revenged, but Hector opposes his defign; and this forms the second intrigue.

which is the last day's battle.

In the Æneid there are also two intrigues. The first is taken up in the voyage and landing of Æneas in Italy; the fecond is his establishment there: the opposition he met with from Juno in both these under-

takings, forms the intrigue.

As to the choice of the intrigue, and the manner of unravelling it, it is certain they ought both to fpring naturally from the ground and fubject of the poem. Boffu gives us three manners of forming the intrigue of a poem: the first is that already mentioned; the fecond is taken from the fable and defign of the poet; in the third the intrigue is fo laid, as that the folution follows from it of courfe.

INTRINSIC, a term applied to the real and genuine values and properties, &c. of any thing, in op-

position to their extrinsic or apparent values.

INTRODUCTION, in general, fignifies any thing which tends to make another in some measure known before we have leifure to examine it thoroughly; and ! hence it is used on a great variety of occasions. Thus we fpeak of the introduction of one person to another; the introduction to a book, &c .- It is also used to fignify the actual motion of any body out of one place into another, when that motion has been occasioned by fome other body.

INTRODUCTION, in oratory. See ORATORY, nº 26. INTUITION, among logicians, the act whereby the mind perceives the agreement or difagreement of two ideas, immediately by themselves, without the intervention of any other; in which case the mind perceives the truth as the eye does the light, only by being directed towards it. See Logic, no 25. 27.

INTUITIVE EVIDENCE, is that which refults from INTUITION. Dr Campbell diftinguishes different forts of intuitive evidence: one refulting purely from intellection, or that faculty which others have called intuition; another kind arising from consciousness; and a third fort from that new-named faculty Common SENSE, which this ingenious writer as well as feveral others contend to be a diffinct original fource of knowledge. whilst others refer its supposed office to the intuitive power of the understanding.

INVALID, a person wounded, maimed, or disabled for action by age.

At Chelfea and Greenwich are magnificent Hospi-

tryected TALS, or rather colleges, built for the reception and ministrator; this is required for the benefit of the creaccommodation of invalids, or foldiers and feamen worn Inventory, out in the fervice.

We have also twenty independent companies of invalids, difperfed in the feveral forts and garrifons.

At Paris is a college of the fame kind, called les Invalides, which is accounted one of the finest buildings in that city.

INVECTED, in heraldry, denotes a thing fluted or furrowed. See HERALDRY.

INVECTIVE, in rhetoric, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the person reproved; whereas the invective is the work of an enemy, and entirely defigned to vex and give uneafiness to the person against whom it is directed.

INVEGES (Augustin), a learned Sicilian Jesuit, wrote in Italian an Hiftory of the city of Palermo, and other works, which are esteemed. He died in

1677, aged 82.

INVENTION, denotes the act of finding any thing new, or even the thing thus found .. Thus we fay, the invention of gunpowder, of printing, &c. The alcove is

a modern invention owing to the Moors.

The Doric, Ionic, and Corinthian orders, are of Greek invention; the Tufcan and Composite of Latin invention. Janfon ab Almeloveen has written an Onomafticon of inventions; wherein are shown, in an alphabetical order, the names of the inventors, and the time, place, &c. where they are made. Pancirollus has a treatife of old inventions that are loft, and new ones that have been made; Polydore Virgil has also published eight books of the inventors of things. De Inventoribus Rerum.

INVENTION is also used for the finding of a thing hidden. The Romish church celebrates a feast on the 4th of May, under the title of, Invention of the Holy

Crofs.

INVENTION is also used for subtilty of mind, or somewhat peculiar to a man's genius, which leads him to a discovery of things new; in which sense we fay, a man of invention.

INVENTION, in painting, is the choice which the painter makes of the objects that are to enter the com-

position of his piece. See PAINTING.

INVENTION, in poetry, is applied to whatever the poet adds to the history of the subject he has chosen; as well as to the new turn he gives it. See POETRY.

INVENTION, in rhetoric, fignifies the finding out and choosing of certain arguments which the orator is to use for the proving or illustrating his point, moving their passions, or conciliating the minds of his hearers. Invention, according to Cicero, is the principal part of oratory: he wrote four books De Inventione, whereof we have but two remaining. See ORATORY.

INVENTORY, in law, a catalogue or schedule orderly made, of all a deceafed perfon's goods and chattels, at the time of his death, with their value appraifed by indifferent perfons, which every executor or administrator is obliged to exhibit to the ordinary at

fuch time as he shall appoint.

By 21 Hen. VIII. c. v. executors and administrators are to deliver in upon oath to the ordinary, indented land, in the county of Fife, fituated on the northern inventories, one part of which is to remain with the ordinary, and the other part with the executor or ad- Lat. 56. 5. It was much favoured by William, who

ditors and legatees, that the executor or administrator may not conceal any part of the personal estate from income. them. The statute ordains, that the inventory shall be ____ exhibited within three months after the person's de-

cease; yet it may be done afterwards, for the ordinary may difpense with the time, and even with its being ever exhibited, as in cases where the creditors are paid.

and the will is executed.

INVERARY, a parliament-town of Scotland, in Argyleshire, pleasantly situated on a small bay formed by the junction of the river Ary with Loch-fin, where the latter is a mile in width and 60 fathoms in depth. Here is a castle, the principal feat of the dukes of Argyle, chief of the Campbells. It is a modern building of a quadrangular form, with a round tower at each corner; and in the middle rifes a fquare one glazed on every fide to give light to the staircase and galleries, which has from without rather a heavy appearance. This cattle is built of a coarfe lapis ollaris brought from the other fide of Loch-fin; and is of the fame kind with that found in Norway, of which the king of Denmark's palace is built. The founder of the castle. the late Duke Archibald, also formed the defign of an entire new town, upon a commodious elegant plan, becoming the dignity of the capital of Argyleshire, a country most admirably situated for fisheries and navigation. The town hath been rebuilt agreeable to the original defign; and the inhabitants are well lodged in houses of stone, lime, and flate. They are fully employed in arts and manufactures, and plentifully fupplied in the produce of fea and land .- The planting around Inverary is extensive beyond conception, and admirably variegated; every crevice, glen, and mountain, difplaying tafte and good fense.

The value of the immense wood at this place, for the various purpofes of bark, charcoal, forges, paling, furniture, house and ship building, is thus estimated by Mr Knox : " Some of the beech are from q to 12 feet in circumference, and the pines from 6 to 0; but these being comparatively few, we shall state the medium girth of 2,000,000 trees planted within these last hundred years, at 3 feet, and the medium value at 4s. which produces L.400,000; and this, for the most part, upon grounds unfit for the plough, being chiefly composed of hills and rock." One of these hills rifes immediately from the house a great height, in the form of a pyramid, and is cloathed to the fummit with a thick wood of vigorous ornamental trees. On this fummit or point Archibald duke of Argyle built a Gothic tour or observatory, where he sometimes amused himself. The ascent by the road seems to be half a mile, and the perpendicular height about 800

INVERBERVIE, or BERVIE, a town of Kincardineshire or the Mearns, 13 miles N. E. from Montrofe. It lies between two small hills, which terminate in high cliffs towards the fea; and though a royal borough, and the only one in the country, it is but a small place, the inhabitants of which are chiefly employed in making thread.

INVERKEITHING, a parliament-town of Scotshore of the Frith of Forth, in W. Long. 3. 15. N. granted

Inverness, considerably, and in the time of David I. it became a royal refidence. The Moubrays had large possessions here, which were forfeited in the reign of Robert II. The Franciscans had a convent in this town; and, ac-

cording to Sir Robert Sibbald, the Dominicans had another. This town has a confiderable trade in coal

and other articles.

INVERLOCHY, an ancient castle in the neighbourhood of Fort-WILLIAM in Invernesshire. It is adorned with large round towers; and, by the mode of building, feems to have been the work of the English in the time of Edward I. who laid large fines on the Scotch barons for the purpose of erecting new caftles. The largest of these towers is called Cumin's. But long prior to these ruins Inverlochy, according to Boece, had been a place of great note, a most opulent city, remarkable for the vast refort of French and Spaniards, probably on account of trade. It was also a feat of the kings of Scotland, for here Achaius in the year 700 figned (as is reported) the league offensive and defensive between himself and Charlemagne. In after-times it was utterly destroyed by the Danes, and never again reflored.

In the neighbourhood of this place were fought two fierce battles, one between Donald Balloch brother to Alexander lord of the isles, who with a great power invaded Lochaber in the year 1427: he was met by the earls of Mar and Caithness; the last was slain, and their forces totally defeated. Balloch returned to the ifles with vaft booty, the object of those plundering chieftains. Here also the Campbells under the marquis of Argyle, in February 1645, received from Montrofe an overthrow fatal to numbers of that gallant name. Fifteen hundred fell in the action and in the pursuit, with the loss only of three to the royalists. Sir Thomas Ogilvie, the friend of Montrose, died of his wounds. His death suppressed all joy for the

INVERNESS, capital of a county of the fame name in Scotland, is a parliament town, finely feated on the river Nefs, over which there is a stone-bridge of feven arches, in W. Long. 4º. N. Lat. 57. 36. It is large, well built, and very populous, being the last town of any note in Britain. As there are always regular troops in its neighbourhood, there is a great air of politeness, a plentiful market, and more money and bufiness ffirring than could have been expected in such a remote part of the island. The country in the neighbourhood is remarkably well cultivated; and its produce clearly shows that the soil and climate are not despicable. The salmon-fishery in the Ness is very confiderable, and is let to London fishmongers. Some branches both of the woollen, linen, and hemp manufacture, are also carried on here; and, in consequence of the excellent military roads, there is'a great proportion of inland trade. But besides all this, Inverness is a port with 20 creeks dependent upon it, part on the Murray Frith to the east, and part on the north of the town, reaching even the fouth border of the county of Caithness. Inverness has several good schools; and it is now intended to erect an academy there on an extenfive scale. The inhabitants speak the Eife and English language promiscuously. On an eminence near the town are the remains of a castle, where, according

Inverlocky, granted its first charter. He extended its liberties to some historians, the famous Macbeth murdered loverness. Duncan his royal gueft.

INVERNESS-Shire, a county of Scotland, bounded on the north by Rossshire; on the east by the shires of Nairne, Murray, and Aberdeen; on the fouth, by those of Perth and Argyle; and on the west, by the Atlantic Ocean. Its extent from north to fouth is above 50 miles; from east to west about 80 .- The northern part of this county is very mountainous and barren. In the diffrict of Glenelg are feen the ruins of feveral ancient circular buildings, fimilar to those in the Western Isles, Sutherland, and Ross shires; concerning the uses of which antiquaries are not agreed. In their outward appearance, they are round and tapering like glass houses. In the heart of the wall, which is perpendicular within, there are horizontal galleries going quite round and connected by flairs. There areend toward the top, which is open. They are all built of stone, without lime or mortar of any kind. They have no opening outward, except the doors and the top; but there are feveral in the infide. as windows to the galleries. From Bernera barracks, in this diffrict, proceeds the military road to Inverness.

This county is nearly divided by water; and it appears from a late furvey, that by means of a canal uniting Loch Nefs, Loch Oich, Loch Lochy, and Lochiel or Loch Eil, a communication might be readily opened here between the two feas. In this tract. Fort George, Fort Augustus, and Fort William, form what is called the Chain of Forts across the island. By means of Fort George on the east, all entrance up. the Frith towards Inverness is prevented; Fort Augustus curbs the inhabitants midway; and Fort William is a check to any attempts in the west. Detachments are made from all these garrisons to Inverness, Bernera barracks opposite to the isle of Skie, and castle Duart in the isle of Mull. Other small parties are also scattered in huts throughout the country, to

prevent the stealing of cattle.

The river Nefs, upon which the capital of the shire is fituated, is the outlet of the great lake called Loch Nels. This beautiful lake is 22 miles in length, and for the most part one in breadth. It is skreened on the northwest by the lofty mountains of Urquhart and Mealfourvony, and bordered with coppices of birch and oak. The adjacent hills are adorned with many extensive forests of pine; which afford shelter to the cattle, and are the retreat of stags and deer. There is much cultivation and improvement on the banks of Loch Ness; and the pasture grounds in the neighbouring valleys are excellent .- From the fouth, the river Fyers descends towards this lake. Over this river there is built a stupendous bridge, on two opposite rocks; the top of the arch is above 100 feet from the level of the water. A little below the bridge is the celebrated Fall of Fyers, where a great body of water darts through a narrow gap between two rocks, then falls over a vast precipice into the bottom of the chasm, where the foam rifes and fills the air like a great cloud of imoke.

Loch Oich is a narrow lake, stretching about four miles from east to west. It is adorned with some small wooded islands, and is surrounded with ancient trees. Near this is the family-feat of Glengary, furrounded

Inverness and its vicinity use the English language, Inverse and pronounce it with remakable propriety.

INVERSE, is applied to a manner of working the

rule of three. See ARITHMETIC, no 12.

INVERSION, the act whereby any thing is inverted or turned backwards. Problems in geometry and arithmetic are often proved by inversion; that is, by a contrary rule or operation.

INVERSION, in grammar, is where the words of a phrase are ranged in a manner not so natural as they might be. For an instance : " Of all vices, the most abominable, and that which leaft becomes a man, is impurity." Here is an invertion; the natural order being this: Impurity is the most abominable of all vices, and that which least becomes a man .- An inverfion is not always difagreeable, but fometimes has a

INVERTED, in mufic, is derived from the Latin preposition in, and vertere, "to turn any thing a contrary way." The analogy of this term, and its use in mufic, will appear more obvious from the fequel.

It fignifies a change in the order of the notes which form a chord, or in the parts which compose harmony: which happens by fubfituting in the bass, those founds which ought to have been in the upper part : an operation not only rendered practicable, but greatly facilitated, by the refemblance which one note has to another in different octaves; whence we derive the power of exchanging one octave for another with fo much propriety and fuccess, or by substituting in the extremes those which ought to have occupied the middle flation; and vice verla.

It is certain, that in every chord there must be a fundamental and natural order, which is the fame with that of its generation: but the circumstances of fuccession, taste, expression, the beauty of melody, and variety, the approximation of harmony, frequently oblige the compofer to change that order by inverting the chords, and of confequence the disposition of the parts.

As three thing may be arranged in fix different orders, and four things in twenty-four; it would feem at first, that a perfect chord should be susceptible of fix invertions, and a diffonant chord of twenty-four ; fince one is composed of four and the other of three founds, and fince invertion confilts only in a transposition of octaves. But it must be observed, that in harmony all the different dispositions of acuter founds are not reckoned as inverfiors, whilft the fame founds re-main in the lower parts. Thus, these two orders of the perfect chord ut mi fol, or CEG, and ut fot mi, or CGE, are only taken for the fame invertion, and only bear the fame name; this reduces the whole of inverfions of which a perfect chord is susceptible to three; that is to fay, to as many invertions as the chord contains different founds: for the replications of the fame found are here reckoned as nothing,

Every time, therefore, when the fundamental bass is heard in the lowest parts, or if the fundamental bass be retrenched, every time when the natural order is preferved in the chords, the harmony is direct. As foon as that order is changed, or as foon as the fundamental founds, without being in the lower parts, are heard in fome of the others, the harmony is inverted. It is an invertion of the chord, when the fundamental

Inverness, by natural woods of full grown fir, which extend nine or ten miles along the banks of the river Gary. The waters of Loch Oich flow through Loch Ness into the eastern fea .- Loch Lochy transmits its waters in an opposite direction, this being the highest part of the valt flat tract that here firetches from fea to fea. This extensive lake is above ten miles in length, and from one to two in breadth. From the well, the waters of Loch Arkek descend into this lake. Out of it runs the river Lochy, which about a mile below its iffue from the lake, receives the Spean, a confiderable river, over which there is a magnificent bridge, built by General Wade, about two miles above the place where it falls into the Lochy. These united streams traverfing the plains of Lochaber, after a course of five or fix miles fall into Loch Eil.

A few miles to the fouth east of Loch Lochy is Glenroy or King's Vale. The north-east end of this valley opens on Loch Spey. A fmall river paffes along the bottom of the vale, accompanied by a modern road. On the declivity of the mountains, about a mile from the river, on either hand are feen feveral parallel roads of great antiquity. On the north-west fide, five of these roads run parallel and close by each other. On the opposite side are three other roads exactly fimilar. These roads are 30 feet broad, all perfectly horizontal, and extend eight or nine miles in length. Their deftination or use has baffled the conjectures of antiquaries .- Not far from Fort Augustus soars the pointed fummit of Bennevish, which is esteemed the highest mountain in Britain, rising more than 4300 feet above the level of the fea .- In the districts of Moydart, Arafaick, Morer, and Knoydart, there are numerous bays and creeks, along the coast, many of which might be excellent fishing stations

The fouthern part of this county is very mountainous, and is supposed to be the most elevated ground in Scotland. From its numerous lakes many streams defcend toward both feas. In the extensive district called Badenock lies Loch Spey, the fource of the great river Spey, which proceeding eastward with an increafing fream; enters the shire of Murray at Rothiemurchus, after having expanded into a fine lake. Not far from this is feen the lofty top of Cairngorm; a mountain celebrated for its beautiful rock-crystals of various tints. These are much esteemed by lapidaries: and fome of them, having the luftre of fine gems, bring a very high price. Limeftone, iron-ore, and fome traces of different minerals, are found in the county; but no mines have yet been worked with much fuccefs. Its rivers and lakes afford abundance of falmon and trout. The extensive plains which furround the lakes are in general fertile; and the high grounds feed many sheep and black cattle, the rearing and felling of which is the chief trade of the inhabitants .- By the prefent spirited exertions of the gentlemen in this populous county, the commerce and the industry of the inhabitants have of late been greatly increased; and to facilitate the communication with other parts, application has been made to parliament for leave to levy a tax on the proprietors of land for improving the roads and erecting bridges in this extensive shire. The commonalty in the high parts of the county and on the western shore speak Gaelic; but the people of fashion in

Nº 168.

Inverted found is transposed; it is likewise an inversion of the harmony, when the treble or any other part moves as the bass ought to have done.

Every where, where a direct chord can be well placed, its invertions will likewife be fo with respect to the harmony: for it is still the same fundamental succesfion. Thus, at every note of the fundamental bass, it is in the power of the compofer to arrange the chord at his pleasure, and of consequence every moment to produce different invertions; provided that he does not change the regular and fundamental fuccession; provided also, that the dissonances may always be prepared and refolved in the fame parts where they are first heard, that the fensible note may always ascend, and that fuch false relations may be avoided as would be too harsh upon the ear in the same part. This is the key of these mysterious distinctions which composers have made between those chords where the treble is fyncopated, and those in which the bass ought to be funcopated; as, for inflance, between the ninth and the fecond: it is thus that in the first the chord is direct. and the dissonance in the treble : in the others, the chord is reverfed, and the diffonance in the bafs.

With respect to chords by supposition, greater precaution is necessary in inverting them. As the found which they add to the bass is absolutely foreign to the harmony; it is often only tolerably there, on account of its valt distance from the other founds, which renders the diffonance less harsh. But if these added founds should happen to be transposed in the higher parts, as it fometimes does; if this transposition be not performed with much art, it may produce a very bad effect; and never can this be happily practifed without taking away fome other found from the chord. See, at the article Accord in the Musical Dictionary, the cases when inversion may be practised, and the choice

of fuch as are proper.

The perfect knowledge of inversion depends on art and fludy alone: the choice is a different matter; to this an ear and a tafte are necessary; experience of the different effects are likewise indispensable; and though the choice of invertions be indifferent with respect to the foundation of the harmony, it is by no means fuch in regard of the effect and expression. It is certain. that the fundamental bass is formed to support the barmony, and to prevail beneath. Every time therefore when the order is changed and the harmony inverted, there ought to be good reasons for it : without which, the compofer will fall into the vice of our more recent music, where the melody of the treble is often like what the bass should be, and the bass always like that of the treble, where every thing is confound ed, reverled, difordered, without any other reason than to subvert the established order, and to spoil the har-

INVESTIGATION, properly denotes the fearching or finding out any thing by the tracts or prints of the feet; whence mathematicians, schoolmen, and grammarians, come to use the term in their respective refearches.

INVESTING a PLACE, is when a general, having an intention to beliege it, detaches a body of horse to possess all the avenues; blocking up the garrison, and preventing relief from getting into the place, till the army and artillery are got up to form the fiege. Vol. IX. Part I.

INVESTITURE, in law, a giving livery of feifin Investiture or possession. There was anciently a great variety of invocations ceremonies used upon investitures; as at first they were made by a certain form of words, and afterwards by fuch things as had the greatest resemblance to the thing to be transferred : thus, where lands were intended to país, a turf, &c. was delivered by the granter to the grantee. In the church, it was cultomary for princes to make inveltiture of ecclefialtical benefices, by delivering to the person they had chosen a pastoral staff and a ring.

INULA, ELECAMPANE: A genus of the polygamia fuperflua order, belonging to the fyngenefia class of plants; and in the natural method ranking under the 49th order, Composita. The receptacle is naked; the pappus fimple; the antheræ, at the base, ending in two briftles. There are 22 species, of which the helenium, or common elecampane, is the most remarkable. It is a native of Britain; but is cultivated in gardens for the fake of the root, which is used in medicine. The root is perennial, thick, branching, and of a ftrong odour. The lower leaves are eight or nine inches long, and four broad in the middle, rough on their upper fide, but downy on the under fide. The flalks rife about four feet high, and divide toward the top into feveral fmaller branches, garnished with oblong oval leaves indented on their edges, ending in acute points. Each branch is crowned with one large yellow radiated flower, succeeded by narrow four-cornered feeds, covered with down. It may be propagated in autumn by feeds

or offsets.

Medicinal Uses, &c. The root of elecampane, eespecially when dry, has an agreeable aromatic smell; its tafte, on chewing, is glutinous, and as it were fomewhat rancid; in a little time it discovers an aromatic bitterness, which by degrees becomes confiderably acrid and pungent. It possesses the general virtues of alexipharmacs; and is principally recommended for promoting expectoration in humoral althmas and coughs. Liberally taken, it is faid to excite urine, and to loofen the belly. In fome parts of Germany, large quantities of this root are candied, and used as a stomachic for ftrengthening the tone of the vifcera in general, and for attenuating tenacious juices. Spirituous liquors extract its virtues in greater perfection than watery ones. The former scarce elevate any thing in distillation : with the latter an effential oil arifes, which concretes into white flakes; this possesses at first the flavour of the elecampane, but is very apt to loofe it in keeping. Outwardly applied, a decoction of it is faid to cure the itch. The root bruifed and macerated in urine with balls of ashes and whortle-berries, dyes a blue colour.

INUNDATÆ, the name of the 15th order in Linnæus's fragments of a natural method; confiding of plants which grow in the water. See BOTANY.

INUNDATION, a fudden overflowing of the dry land by the waters of the ocean, rivers, lakes, fprings,

INVOCATION, in theology, the act of adoring God, and especially of addressing him in prayer for his affiitance and protection. See the articles ADORATION and PRAYER.

The difference between the invocation of God and 00

10

Invocation of the faints, as practifed by the Papifts, is thus ex- by Phonician merchants, who wished to make repriplained in the catechism of the council of Trent. "We sals for Europa who had been stolen from them by the beg of God, (fays the catechifm,) to give us good Greeks. things, and to deliver us from evil; but we pray to the faints, to intercede with God and obtain those things which we fland in need of. Hence we use different forms in praying to God and to the faints: to the former we fay, bear us, have mercy on us; to the latter we only lay, pray for us." The council of Trent expressly teaches, that the faints who reign with lefus Christ offer up their prayers to God for men; and condemn those who maintain the contrary doctrine, The Protestants reject and censure this practice as contrary to scripture, deny the truth of the fact, and think it highly unreasonable to suppose that a limited finite being should be in a manner omnipresent, and at one and the same time hear and attend to the prayers that are offered to him in England, China, and Peru; and from thence infer, that if the faints cannot hear their requests, it is inconfiftent with common fense to address any kind of prayer to

INVOCATION, in poetry, an address at the beginning of a poem, wherein the poet calls for the affiftance of fome divinity, particularly of his muse, or the deity

INVOICE, an account in writing of the particulars of merchandife, with their value, cuftom, charges, &c. transmitted by one merchant to another in a distant

INVOLUCRUM, among botanists, expresses that fort of cup which furrounds a number of flowers together, every one of which has befide this general cup its own particular perianthium. The involucrum confifts of a multitude of little leaves disposed in a radiated manner. See CALYX.

INVOLUTION, in algebra, the raifing any quantity from its root to any height or power affigned. See ALGEBRA.

IO, (fab. hift.) daughter of Inachus, or according to others of Jasus or Pirenc, was priestels of Juno at Argos. Jupiter became enamoured of her; but Juno, jealous of his intrigues, discovered the object of his affection, and furprifed him in the company of Io. Jupiter changed his mistress into a beautiful heifer; and the goddess, who well knew the fraud, obtained from her husband the animal whose beauty she had condescended to commend. Juno commanded the hundred eyed Argus to watch the heifer; but Jupiter, anxious for the fituation of Io, fent Mercury to defroy Argus, and to restore her to liberty. Io, freed from the vigilance of Argus, was now perfecuted by Juno, who fent one of the Furies to torment her. She wandered over the greatest part of the earth and croffed over the sea, till at last she stopped on the banks of the Nile, still exposed to the unceasing torments of the Fury. Here she entreated Jupiter to restore her to her natural form; and when the god had changed her from a heifer into a woman, the brought forth Epaphus. Afterwards the married Telegonus king of Egypt, or Ofiris according to others; and the treated her subjects with such mildness and humanity, that after death she received divine honours, and was worshipped under the name of Ifis. According to Herodotus, Io was carried away

IOAB, general of the army of king David, defeated the Syrians and the other enemies of David, and took the fort of Zion from the Jebulites, who, thinking it impregnable, committed it to the care of the lame and blind, whom they placed on the walls. He fignalized himself in all David's wars, but was guilty of basely murdering Abner and Amasa. He procured a reconciliation between Abfalom and David; and afterwards flew Abfalom, contrary to the express orders of the king. He at length joined Adonijah's party; and was put to death by the order of Solomon, 1014

IOACHIMITES, in church history, the disciples of Joachim a Ciftertian monk, who was an abbot of Flora in Calabria, and a great pretender to inspira-

The Joachimites were particularly fond of certain ternaries: The Father, they faid, operated from the beginning till the coming of the Son; the Son, from that time to theirs, which was the year 1260; and from that time the Holy Spirit was to operate in his turn. They also divided every thing relating to men, to doctrine, and the manner of living, into three claffes, according to the three perfons in the Trinity : The first ternary was that of men; of whom the first class was that of married men, which had lasted during the whole period of the Father; the fecond was that of clerks, which had lasted during the time of the Son; and the last was that of the monks, in which there was to be an uncommon effusion of grace by the Holy Spirit: The fecond ternary was that of doctrine. viz. the Old Testament, the New, and the everlasting Gospel; the first they ascribed to the Father, the fecond to the Son, and the third to the Holy Spirit : A third ternary confifted in the manner of living, viz. under the Father, men lived according to the flesh : under the Son, they lived according to the flesh and the fpirit : and under the Holy Ghoft, they were to live according to the foirit only.

JOAN (Pope), called by Platina John VIII. is faid to have held the holy fee between Leo IV, who died in 855, and Benedict III. who died in 858. Marianus Scotus fays, fhe fat two years five months and four days. Numberless have been the controverfies, fables, and conjectures, relating to this pope. It is faid that a German girl, pretending to be a man, went to Athens, where the made great progress in the sciences; and afterward came to Rome in the same habit. As she had a quick genius, and spoke with a good grace in the public disputations and lectures, her great learning was admired, and every one loved her extremely; fo that after the death of Leo, she was chosen pope, and performed all offices as such. Whilst the was in poffession of this high dignity, the was got with child; and as the was going in a folemn proceffion to the Lateran church, the was delivered of that child, between the Colifeum and St Clement's church, in a most public street, before a crowd of people, and died on the fpot, in 857. By way of embellishing this flory, may be added the precaution reported to have been afterward taken to avoid such another accident. After the election of a pope, he was placed on a chair with an open feat, called the groping chair, when a deacon came most devoutly behind and fatiffied himself of the pontiff's fex by feeling. This precaution, however, has been long deemed unnecessary, because the cardinals now always get bastards enough to establish their virility before they arrive at the pontificate.

JOAN d' Arc, or the Maid of Orleans, whose heroic behaviour in reanimating the expiring valour of the French nation, though by the most superstitious means, (pretending to be inspired), deserved a better fate. She was burnt by the English as a forceres in 1421,

aged 24. See FRANCE, no 101.

JOANNA (St), one of the Comora islands in the Indian ocean, E. Long. 44. 15. S. Lat. 12. 30. The north fide shoots out into two points, 26 miles afunder, between which there is a great bay. This island is a proper place of refreshment for the East India ships, whole crews, when ill of the fcurvy, foon recover by the use of limes, lemons, and oranges, and from the air of the land. The town where the king refides is at the east fide of the island; and though it is three quarters of a mile in length, it does not contain above 200 houses. Their principal houses are built with ftone, with a quadrangle in the middle, and are only one flory high. All the other houses, or rather huts, are flightly composed of plastered reeds; and yet the mosques are tolerable structures, very neat and clean in the infide. The horned cattle are a kind of buffaloes, liaving a large hump on their shoulders, which is very delicious eating; but there is not one horfe, mule, nor afs, in all the ifland .- The original natives, in number about 7000, occupy the hills, and are generally at war with the Arabian interlopers, who effablished themselves on the sea-coast by conquest, and are about 3000 in number. These latter are described by Vide Letter an anonymous letter-writer * as poor miferable beings, who not being able to carry on any extensive degree of cultivation, on account of their being exposed to the depredations of the mountaineer natives, fubfilt chiefly by supplying the India ships who touch there for refreshment with a few cattle and tropical fruits. According to the same writer, the descriptions of this 8vo, 1780. island and its inhabitants by the Abbé Paynal and Major Rooke, are not only exaggerated but erroneous: neither the country being so picturesque in beautiful landscapes as the former describes it, nor the inhabitants meriting the respectable character given of them by the latter. As we are not, however, competent to decide in this matter, we shall subjoin the entertaining account given by the Major.

" Though Joanna is not the largeft, yet it may the Coast of be reckoned the principal of the Comora Islands; Arabia Fe- it claims fovereignty over, and exacts tribute from, dix, let. 4. all the others; these pretentions it is however sometimes obliged to affert by the fword, and at prefent meditates an expedition against Mayotta, which is in a state of rebellion. The natives on being asked the cause of their war with that people, reply, " Mayotta like America." They get their supplies of arms and ammunition from thips that touch here; and the

arrival of to large a fleet as the prefent will prove very feafonable to them, as it is customary for all to make

pays a visit on board, which he does to every one. A Joznna. falute is the compliment due on that occasion; but as our guns are shotted, an apology is made for the omiffion of that ceremony, and the prince readily admits of it, provided he receives a number of cartridges equal

to the guns that would have been fired.

"The king lives at a town about 12 miles off on the east fide of the island: two princes of the blood reside here; who on going their round of vifits fail not to afk for every thing they fee which flrikes their fancy; and of course the honour of making a present to a prince, induces one at first readily to grant what they request : but no fooner is that done than they make fresh applications, till we are reduced to the rude necessity of putting the negative on most of them. These great perfonages are very richly dreffed and attended by a numerous fuite of flaves, who, like their princely mafters, are much ftruck with the objects they fee, but use less ceremony in their manner of obtaining them. These black princes (for that is the complexion of them and all the inhabitants) have by fome means or other obtained the titles of Prince of Wales and Prince Will: the former has probably been called fo by fome jocole Englishmen as being the heir apparent, and the natives have adopted the term, not the only one they borrow from us. They have an officer styled Purser Jack, who feems to be at the head of the financedepartment. Of dukes they have a prodigious number. who entertain us at their hotels for a dollar per day, and give us for dinner very good rice and curry. Thefe noblemen, together with a numerous tribe of others of all ranks, make the earliest application to every one to folicit the honour of his company and custom; even before the ship has let go its anchor, they come along fide in their canoes, and produce written certificates of their honesty and abilities from those who have been here before: the purport of which is to inform you that the bearer has given them good cheer, washed their linen well, and supplied their ship punctually with all forts of refreshments.

" The effect is firiking and fingular on entering the road to fee a vast number of canoes, which are made of trunks of trees hollowed out, with three or four black fellows in each, their faces turned towards the front of the canoe, with paddles formed like a fpade, digging away in the water, and moving with no fmall velocity. To keep these cockle shells steady, and prevent them from overfetting, they have what is termed an outrigger: it is composed of two poles laid across the upper part of the canoe, and extending feveral feet beyond the edges thereof on each fide, joined at the extremities by two flat pieces of wood, fo that it appears like a square frame laid across the canoe: they are very long, but fo narrow that one person can only sit

" The price of every article here is regulated; and each ship has its contractor who engages to supply it with necessaries at the established rate.

" We find no other animals for our fea provisions but bullocks, goats, and fowls: the feafon for oranges is past, but we get most other tropical fruits; and whatever we want, have only to give in a lift to a duke, and he provides us therewith. This, it will be thought, is a new character for a duke to appear in, and fuch it feems presents of arms and powder to the prince when he to be; but it is in fact only owing to the mode: they

board an Indiaman. giving an the ifland

Joanna, are their own stewards, and dispose of the produce of with a number of small mirrors, bits of china ware, Joanna. their estates themselves, which noblemen of other and other little ornaments that they procure from ships countries do by the intermediate aid of an agent; they at least act confishently with their characters by an urbanity of manners, which one is furprifed to meet with in a people inhabiting a fmall fpot feeluded from the rest of the civilized world. They have a regular form of government, and exercise the Mahometan religion: both were introduced by Arabians who passed over from the continent and fubdued the country. The original Joanna natives are by no means thoroughly reconciled to this usurpation, and still look upon their conquerors with an evil eye. Like their fentiments, fo are the colours of these two races of men very different: the Arabs have not fo deep a tinge as the others, being of a copper complexion with better features and a more animated countenance. They confider a black ftreak under the eyes as ornamental; and this they make every day at their toilettes with a painting brush dipt in a kind of ointment. The custom of chewing the betel nut prevails greatly here, as in most of the Eastern countries; and answers to the fashion of fmoking tobacco or taking fnuff with us, except that with them it is more general. No one is without a purse or bag of betel; and it is looked on as a piece of civility to offer it to your friend when you meet him or take leave. See the articles ARECA and BETEL.

"Their religion licenses a plurality of wives and likewife concubines. They are extremely jealous of them, and never allow any man to fee the women : but female flrangers are admitted into the haram; and fome English ladies, whose curiofity has led them there, make favourable reports of their beauty, and richness of apparel displayed in a profusion of ornaments of gold, filver, and beads, in form of necklaces, bracelets, and ear-rings; they wear half a dozen or more in each through holes bored all along the outer

rim of the ear.

"The men feem not to look with an eye of indifference on our fair countrywomen notwithstanding they are of fo different a complexion. One of the first rank among them being much smitten with an English young lady, wished to make a purchase of her at the price of 5000 dollars; but on being informed that the lady would fetch at least 20 times that fum in India, he lamented that her value was fo

far superior to what he could afford to give.

" These people are very temperate and abstemious, wine being forbidden them by the law of Mahommed. They are frequent in prayer, attending their mosques three or four times a-day. We are allowed to enter them on condition of taking off our shoes. These buildings are regular, but quite plain. In prayer the people proftrate themselves on the ground, frequently kiffing it and expressing very fervent devotion.

" Joanna town is close to the fea, fituated at the foot of a very high hill, and about a mile and a half in circuit. The houses are inclosed either with high stone walls or palings made with a kind of reed; and the freets are little narrow alleys, extremely intricate and forming a perfect labyrinth. The better kind of houses are built of stone within a court-yard, have a portico to shield them from the fun, and one long lofty room where they receive guests, the other apartments being facred to the women. The fides of their rooms are covered with the conferences he had with his cruel friends on

which come here to refresh: the most superb of them are furnished with cane fophas covered with chintz and fattin mattreffes. Most of the people speak a little English: they profess a particular regard for our nation, and are very fond of repeating to you, that "Joanna man and English man all brothers;" and never fail to ask "how King George do?" In general they appear to be a courteous and well difposed people, and very fair and honest in their dealings, though there are amongst them, as in all other nations, fome viciously inclined; and theft is much practifed by the lower class, not withfranding the punishment of it is very exemplary, being amputation of both hands of the

delinquent.

"The inhabitants of this island, like those of most hot and tropical countries, are indolent, and do not improve by their labour the richness of that foil with which nature has bleffed them. Climate here favours vegetation to fuch a degree as requires little toil in the husbandman; but that little is denied; fo that beyond oranges, bananas, pine-apples, cocoa nuts, yams, and pursiain (all growing spontaneously), few vegetables are met with. Nor are the natural beauties of the island inferior to its other advantages of plenty and fertility; the face of the country is very picturefque and pleafing, its scenes being drawn by the bold strokes of Nature's masterly pencil: lofty mountains clothed to their very fumnits, deep and rugged valleys adorned by frequent cataracts, cafcades, woods, rocks, and rivulets, intermixed in " gay theatric pride," form the landscape. Groves are seen extending over the plains to the very edge of the fea, formed principally by the cocoa-nut trees, whose long and naked items leave a clear uninterrupted paffage beneath; while their tufted and overspreading tops form a thick shade above, and keep off the foorching rays of the fun. In thefe we pitch our tents and enjoy a short relief from the ennui of a tedious voyage.

" In the interior part of the island, surrounded by mountains of a prodigious height, and about 15 miles from this town, is fituated a facred lake half a mile in circumference. The adjacent hills covered with lofty trees, and the unfrequented folitude of the place, feem more calculated to inspire religious awe in those who visit this sequestered spot, than any fanctity that is to be discovered in a parcel of wild ducks inhabiting it, which are deified and worshipped by the original natives, who confult them as their oracles on all important affairs, and facrifice to them. Being extremely averse to conduct strangers there, they stipulate that all guns shall be left at a place five miles from the lake. The worship paid to these birds ensures their safety and tranquillity; and rendering them of course perfectly tame, they fearlefsly approach any one who goes there. The Arabian part of the islanders hold this barbarous fuperstition in the utmost detestation; but dare not forbid the practice of it, fo bigotted to it are the others."

IOB, or Book of FoB, a canonical book of the Old Tellament, containing a narrative of a feries of miffortunes which happened to a man whose name was Job, as a trial of his virtue and patience; together

the Inbiect of his misfortunes, and the manner in which he was reftored to ease and happiness. This book is filled with those noble, bold, and figurative expressions, which conflitute the very foul of poetry.

Many of the lewish rabbins pretend that this relation is altogether a fiction: others think it a simple narrative of a matter of fact just as it happened; while a third fort of critics acknowledge, that the groundwork of the flory is true, but that it is wrote in a poetical strain, and decorated with peculiar circumflances, to render the narration more profitable and entertaining.

The time is not fet down in which Tob lived. Some have thought that he was much ancienter than Mofes. because the law is never cited by Job or his friends, and because it is related that Job himself offered facrifices. Some imagine that this book was wrote by himself: others say, that Job wrote it originally in Syriac or Arabic, and that Mofes translated it into Hebrew: but the rabbins generally pronounce Mofes to be the author of it; and many Christian writers are of the fame opinion.

JOBBER, a person who undertakes jobs, or finall

pieces of work. In some statutes, jobber is used for a person who

buys and fells for others. See BROKER. IOBBING, the business of a jobber.

Stock- FOBBING, denotes the practice of trafficking in the public funds, or of buying and felling stock with a view to its rife or fall. The term is commonly applied to the illegal practice of buying and felling flock for time, or of accounting for the differences in the rife or fall of any particular flock for a flipulated time, whether the buyer or feller be poffeffed of any fuch real flock or not. See Stock BROKER.

JOBERT (Lewis), a pious and learned Jesuit, born at Paris in 1647. He diftinguished himself as a preacher; and besides several other tracts wrote a treatise entitled La Science des Medailles, which is in good esteem. He died in 1719; and the best edi tion of this work is that of Paris in 1739, 2 vols

IOCASTA, (fab. hift,) a daughter of Menœceus, who married Lains king of Thebes, by whom she had Œdipus. She afterwards married her fon Œdipus, without knowing who he was, and had by him Eteocles, Polynices, &c. When the discovered that the had married her own fon and been guilty of incest, she hanged herfelf in despair. She is called Epicasta by some mythologists.

JOCKEY, in the management of horses; the perfon who trims up, and rides about horses for sale.

JODE (Peter de), an engraver of some note, was a native of Antwerp. He received his first instructions in the art of engraving from Henry Goltzius; and afterwards went to Italy, in order to complete his studies from the works of the great masters. He engraved feveral plates in that country from different painters; and returned to Antwerp about the year 1601, where he refided till the time of his death, which happened A. D. 1634. His works are very numerous, and poffess a confiderable share of merit.

JODE (Peter de, the younger), was fon to the former, and born in 1606. From his father he learned the art of engraving, and furpaffed him in tafte and Jodelle the facility of handling the graver; though he can fearcely be faid to have equalled him in correctness of drawing, especially when confined to the naked parts of the human figure. It does not appear that he went to Italy; but he accompanied his father to Paris, where they engraved conjointly a confiderable number of plates for M. Bonefant, and Le Sieur L'Imago. His most capital performances are from Rubens and Vandyck. Basan says of him, that in several of his engravings he has " equalled the best engravers, and in others he has funk below himself." The time of his death is not known. He left a fon, Arnold, who was also an engraver, but of very inferior merit.

JODELLE (Stephen), lord of Limodin, was born at Paris in 1532; and diffinguished himself so greatly by his poetical talents, that he was reckoned one of the Pleiades celebrated by Ronfard. He is faid to be the first Frenchman who wrote plays in his own language according to the ancient form. He was remarkably ready at composition, writing without study or labour; and was well skilled in polite arts and genteel exercifes. In his younger years he embraced the reformed religion, and wrote a fatire on the mass in 100 Latin verses; yet all of a sudden returned to that mass

again. He died in 1579, very poor.

JOEL, or the Prophecy of Joel, a canonical book of the Old Testament. Joel was the fon of Pethnel, and the fecond of the twelve leffer prophets. The ftyle of this prophet is figurative, ftrong, and expreffive. He upbraids the Ifraelites for their idolatry. and foretels the calamities they should fuffer as the punishment of that fin ; but he endeavours to support them with the comfort that their miferies should have an end upon their reformation and repentance. Some writers, inferring the order of time in which the minor propliets lived from the order in which they are placed in the Hebrew copies, conclude that Joel prophelied before Amos, who was contemporary with Uzziah, king of Judah. Archbishop Usher makes this inference from Joel's foretelling that drought, chap, i. which Amos mentions as having happened, chap. iv. 7, 8, 9. If we confider the main defign of Joel's prophecy, we shall be apt to conclude, that it was uttered after the captivity of the ten tribes; for he directs his discourse only to Judah, and speaks diffinelly of the facrifices and oblations that were daily made in the

JOGHIS, a fect of heathen religious in the East Indies, who never marry, nor hold any thing in private property; but live on alms, and practife ftrange feve-

rities on themselves.

They are subject to a general, who sends them from one country to another to preach. They are, properly, a kind of penitent pilgrims; and are supposed to be a

branch of the ancient Gymnosophilts.

They frequent, principally, fuch places as are confecrated by the devotion of the people, and pretend to live feveral days together without eating or drinking. After having gone through a course of discipline for a certain time, they look on themselves as impeccable, and privileged to do any thing; upon which they give a loofe to their passions, and run into all manner of debauchery.

P. 160.

IOGUES, or Yoogs, certain ages, æras, or periods, of extraordinary length, in the chronology of the Hindoos. They are four in number ; of which the following is an account, extracted from Halhed's Preface to the Code of Gentoo Laws, p. xxxvi.

1. The Suttee Fogue (or age of purity) is faid to have lasted three million two hundred thousand years; and they hold that the life of man was extended in that age to one hundred thousand years, and that his sta-

ture was twenty-one cubits.

2. The Tiriah Jogue (in which one third of man-kind was corrupted) they suppose to have consisted of two million four hundred thousand years, and that men lived to the age of ten thousand years.

3. The Dwapaar Jogue (in which half of the human race became depraved) endured one million fix hundred thousand years, and the life of man was then

reduced to a thoufand years.

4. The Collee Jogue (in which all mankind are corrupted, or rather lessened, for that is the true meaning of Collee) is the present æra, which they suppose ordained to subfift four hundred thousand years, of which near five thousand are already past; and the life of man in that period is limited to one hundred years.

Concerning the Indian chronology, we have already had occasion to be pretty copious; fee HINDOOS, n' 19, 22. We shall here, however, subjoin Dr Robertion's observations on the above periods, from the Notes to his Historical Disquisition concerning India,

" If (fays he+) we suppose the computation of time in the Indian chronology to be made by folar or even by lunar years, nothing can be more extravagant in itself, or more repugnant to our mode of calculating the duration of the world, founded on facred and infallible authority. From one circumstance, however, which merits attention, we may conclude, that the information which we have hitherto received concerning the chronology of the Hindoos is very incorrect. We have, as far as I know, only five original accounts of the different Jogues or æras of the Hindoos. The first is given by M. Roger, who received it from the Brahmins on the Coromandel coast. According to it, the Suttee Jogue is a period of one million feven hundred and twenty-eight thousand years; the Tirtah Jogue is one million two hundred and ninety-fix thousand years; the Dwapaar Jogue is eight hundred and fixty four thousand. The duration of the Collee Jogue he does not specify; (Porte Ouwerte, p. 179.) The next is that of M. Bernier, who received it from the Brahmins of Benares. According to him, the duration of the Suttee Jogue was two million five hundred thousand years; that of the Tirtah Jogue one million two hundred thousand years; that of the Dwapaar Jogue is eight hundred and fixty-four thousand years. Concerning the period of the Collee Jogne, he likewise is filent; (Voyages, tom. ii. p. 160.) The third is that of Colonel Dow; according to which the Suttee Jogue is a period of fourteen million of years, the Tirtah Jogue one million eighty thousand, the Dwapaar Jogue seventy-two thousand, and the Collee Jogue thirty fix thousand years ; (Hift. of Hindoft. vol. i. p. 2.) The fourth account is that of M. Le Gentil, who received it from the Brahmins of the Coromandel coast; and as his information was acquired in the same part of India, and

derived from the same fource with that of M. Roger. it agrees with his in every particular. (Mem. de l' Academ. des Sciences pour 1772, tom. ii. part i. p. 176.) The fifth is the account of Mr Hallhed, which has been already given. From this difcrepancy, not only of the total numbers, but of many of the articles in the different accounts, it is manifest that our information concerning Indian chronology is hitherto as uncertain as the whole fystem of it is wild and fabulous. To me it appears highly probable, that when we understand more thoroughly the principles upon which the factitions aras or jogues of the Hindoos have been formed, that we may be more able to reconcile their chronology to the true mode of computing time. founded on the authority of the Old Testament; and may likewife find reason to conclude, that the account given by their astronomers of the situation of the heavenly bodies at the beginning of the Collee Toque, is not established by actual observation, but the result of a retrospective calculation."

JOHN (St), the BAPTIST, the fore-runner of Jefus Chrift, was the fon of Zacharias and Elizabeth. He retired into a defart, where he lived on locusts and wild honey; and about the year 29 began to preach repentance, and to declare the coming of the Mcshah. He baptized his disciples, and the following year Christ himself was baptized by him in the river Jordan. Some time after, having reproved Herod Antipas, who had a criminal correspondence with Herodias his brother Philip's wife, he was cast into prison. where he was beheaded. His head was brought to Herodias; who, according to St Jerome, pierced his tongue with the bodkin she used to fasten up her hair, to revenge herfelf after his death for the freedom of his

reproofs.

JOHN (St), the apostle, or the evangelist, was the brother of St James the Great, and the fon of Zebedee. He quitted the business of fishing to follow Jesus, and was his beloved disciple. He was witness to the actions and miracles of his Mafter; was prefent at his transfiguration on mount Tabor; and was with him in the garden of Olives He was the only aposlle who followed him to the cross; and to him Jesus left the care of his mother. He was also the first apostle who knew him again after his refurrection. He preached the faith in Afia; and principally relided at Ephefus, where he maintained the mother of our Lord. He is faid to have founded the churches of Smyrna, Pergamus, Thyatira, Sardis, Philadelphia, and Laodicea. He is also faid to have preached the gospel amongst the Parthians, and to have addressed his first epistle to that people. It is related, that, when at Rome, the emperor Domitian caufed him to be thrown into a caldron of boiling oil, when he came out unhurt; on which he was banished to the file of Patmos, where he wrote his Apocalypse. After the death of Domitian, he returned to Ephefus, where he composed his Gospel, about the year 96; and died there, in the reign of Trajan, about the year 100, aged 94.

Gofpel of St John, a canonical book of the New Testament, containing a recital of the life, actions, doctrine, and death, of our Saviour Jefus Christ written by St John the apostle and evangelist.

St John wrote his Gospel at Ephesus, after his return

John. turn from the ifle of Patmos, at the defire of the Christians of Asia. St Jerome fays, he would not undertake it, but on condition that they should appoint a public fast to implore the affistance of God; and that, the fait being ended, St John, filled with the Holy Ghost, broke out into these words, " In the beginning was the Word," &c. The ancients affign two reasons for this undertaking : the first is, because, in the other three Gospels, there was wanting the history of the beginning of Jesus Christ's preaching, till the imprisonment of John the Baptist, which therefore he applied himself particularly to relate. The fecond reason was, in order to remove the errors of the Corinthians, Ebionites, and other fects. But Mr Lampe and Dr Lardner have urged feveral reasons to show that St John did not write against Cerinthus or any other heretics in his Gospel.

Revelation of St JOHN. See APOCALYPSE.

JOHN of Salifbury, bishop of Chartres in France, was born at Salisbury in Wiltshire, in the beginning of the 12th century. Where he imbibed the rudiments of his education, is unknown; but we learn, that in the year 1136, being then a youth, he was fent to Paris, where he studied under several eminent professors, and acquired considerable fame for his application and proficiency in rhetoric, poetry, divinity, and particularly in the learned languages. Thence he travelled to Italy : and, during his refidence at Rome, was in high favour with pope Eugenio III. and his fuccessor Adrian IV. After his return to England, he became the intimate friend and companion of the famous Thomas BECKET, archbishop of Canterbury, whom he attended in his exile, and is faid to have been present when that haughty prelate was murdered in his cathedral. What preferment he had in the church during this time, does not appear; but in 1176 he was promoted by king Henry II. to the bishopric of Chartres in France, where he died in 1182. This John of Salisbury was really a phænomenon. He was one of the first restorers of the Greek and Latin languages in Europe; a classical scholar, a philofopher, a learned divine, and an elegant Latin poet. He wrote feveral books; the principal of which are, his Life of St Thomas of Canterbury, a collection of letters, and Polycraticon.

Pope JOHN XXII. a native of Cahors, before called Fames d'Euse, was well skilled in the civil and canon law; and was elected pope after the death of Clement V. on the 7th of August 1316. He published the conflitutions called Clementines, which were made by his predeceffor; and drew up the other conftitutions called Extravagantes. Lewis of Bavaria being elected emperor, John XXII. opposed him in favour of his competitor; which made much noise, and was attended with fatal confequences. That prince, in 1329, caused the antipope Peter de Corbiero, a cordelier, to be elected, who took the name of Nicholas V. and was fupported by Michael de Cesenne, general of his order; but that antipope was the following year taken and carried to Avignon, where he begged pardon of the pope with a rope about his neck, and died in prifon two or three years after. Under this pope arofe the famous question among the cordeliers, called the bread of the cordeliers; which was, Whether those

monks had the property of the things given them, at the time they were making use of them? for example, Whether the bread belonged to them when they were eating it, or to the pope, or to the Roman church? This frivolous question gave great employment to the pope; as well as those which turned upon the colour, form, and fluff, of their habits, whether they ought to be white, grey, or black; whether the coul ought to be pointed or round, large or fmall; whether their robes ought to be full, fhort, or long; of cloth, or of ferge, &c. The difputes on all these minute trifles were carried fo far between the minor brothers, that fome of them were burned upon the occasion. He died at Avignon in 1334, aged 90.

JOHN, king of England. See ENGLAND, nº 135,147.

JOHN of Fordoun. See FORDOUN.

JOHN of Gaunt, duke of Lancatter, a renowned general, father of Henry IV. king of England, died

JOHN of Leyden, otherwise called Buccold. See ANABAPTISTS

JOHN Sobieski of Poland, one of the greatest warriois in the 17th century, was, in 1665, made grandmarshal of the crown; and, in 1667, grand-general of the kingdom. His victories obtained over the Tartars and the Turks procured him the crown, to which he was elected in 1674. He was an encourager of arts and sciences, and the protector of learned men. He died in 1696, aged 72.

St John's Day, the name of two Christian festivals: one observed on June 24th, kept in commemoration of the wonderful circumstances attending the birth of John the Baptist; and the other on December 27th,

in honour of St John the evangelift. St John's Wort. See Hypericum.

JOHN's (St), an island of the East-Indies, and one of the Philippines, east of Mindanayo, from which it is feparated by a narrow strait. E. Long. 125. 25. N. Lat. 7. 0.

JOHN's (St), an island of North-America, in the bay of St Lawrence, having New-Scotland on the fouth and west, and Cape Breton on the east. The British got possession of it when Louisbourg was fur-

rendered to them, on July 26, 1758.

JOHNSON (BEN), one of the most considerable dramatic poets of the last age, whether we consider the number or the merit of his productions. He was born at Westminster in 1574, and was educated at the public school there under the great Camden. He was descended from a Scottish family; and his father, who loft his eftate under Queen Mary, dying before our poet was born, and his mother marrying a bricklayer for her fecond husband, Ben was taken from school to work at his father-in law's trade. Not being captivated with this employment, he went into the Low Countries, and diftinguished himself in a military capacity. On his return to England, he entered himself at St John's college, Cambridge; and having killed a person in a duel, was condemned, and narrowly escaped execution. After this he turned actor; and Shakespeare is faid to have first introduced him to the world, by recommending a play of his to the stage. after it had been rejected. His Alchymift gained him fuch reputation, that in 1619 he was, at the death of

Johnson. Mr Daniel, made poet-laureat to King James I.and master of aits at Oxford. As we do not find Johnson's reconomical virtues any where recorded it is the less to be wondered at, that a ter this we find him petitioning king Charles, on his accession, to enlarge his father's allowance of too merks into pounds; and quickly after we learn, that he was very poor and fick, lodging in an obscure alley: on which occasion it was, that Charles, being prevailed on in his favour, fent him ten guineas; which Ben receiving, faid, " His majesty has fent me ten guineas, because I am poor and live in an alley; go and tell him, that his foul lives in an alley." He died in August 1637, aged 63 years, and was buried in Westminister-Abbey .- The most complete edition of his works was printed in 1756, in 7 vols 8vo.

IOHNSON (Samuel), an English divine, remarkable for his learning, and steadiness in suffering for the principles of the revolution in 1688. He was born in 1640; and, entering into orders, obtained in 1670 the rectory of Corringham in the hundreds of Effex, worth no more than L. So a year; which was the only church-preferment he ever had. The air of this place not agreeing with him, he was obliged to place a curate on the spot, at the expence of half his income, while he fettled at London; a fituation much more to his liking, as he had a strong propensity to politics. The times were turbulent; the duke of York declaring himfelf a Papift, his fuccession to the crown began to be warmly opposed; and Mr Johnson, who was naturally of no submissive temper, being made chaplain to lord William Ruffel, engaged the ecclefiaffical champion for paffive obedience Dr Hicks, in a treatise intitled Julian the apostate, &c. published in 1682. He was answered by Dr Hicks in a piece intitled Jovian, &c. To which he drew up, and printed, a reply, under the title of Julian's arts to undermine and extirpate Christianity, &c.; but by the advice of his friends suppressed the publication. For this unpublished work he was committed to prifon: but not being able to procure a copy, the court profecuted him for writing the first tract, condemned him to a fine of 500 merks, and to lie in prison until it was paid. By the affiftance of Mr Hambden, who was his fellow-prifoner, he was enabled to run into farther troubles; for on the encampment of the army on Hounflow heath, in 1686, he printed and dispersed, An humble and hearty address to all the Protestants in the present army; for this he was sentenced to a second fine of 500 merks, to be degraded from the priesthood, to fland twice in the pillory, and to be whipped from Newgate to Tyburn. It happened luckily, that, in the degradation, they omitted to ftrip him of his caffock; which circumstance, flight as it may appear, rendered his degradation imperfect, and afterwards preferved his living to him. Intercession was made to get the whipping omitted; but lames replied, "That fince Mr Johnson had the spirit of martyrdom, it was fit he should suffer :" and he bore it with firmness, and even with alacrity. On the Revolution, the parliament refolved the proceedings against him to be null and illegal; and recommended him to the king, who offered him the tich deanery of Dur-Nº 168.

and fufferings, which he thought to merit a bishopric. Johnson. The truth was, he was paffionate, felf-opiniated, and turbulent; and though, through Dr Tillotfon's means, he obtained a pension of 3001. a-year, with other gratifications, he remained discontented ; pouring forth all his uncafiness against a standing army, and the great favours shown to the Dutch. He died in 1703. and his works were afterwards collected in one volume folio.

JOHNSON (Dr Samuel), who has been styled the brighteft ornament of the 18th century, was born in the city of Litchfield in Staffordshire on the 18th of September N. S. 1700. His father Michael was a bookfeller: and must have had some reputation in the city, as he more than once bore the office of chief magistrate. By what cafuiftical reasoning he reconciled his conscience to the oaths required to be taken by all who occupy fuch stations, cannot now be known; but it is certain that he was zealoufly attached to the exiled family, and inftilled the same principles into the youthful mind of his fon. So much was he in earnest in this work, and at so early a period did he commence it, that when Dr Sachaverel, in his memorable tour through England, came to Litchfield, Mr Johnson carried his fon, not then quite three years old, to the cathedral, and placed him on his shoulders, that he might see as well as hear the far-famed preacher.

But political prejudices were not the only bad things which young Sam inherited from his father: he derived from the same source a morbid melancholy, which, though it neither depressed his imagination, nor clouded his perspicacity, filled him with dreadful apprehenfions of infanity, and rendered him wretched through life. From his nurse he contracted the scrophula or king's evil, which made its appearance at a very early period, disfigured a face naturally well-formed, and deprived him of the fight of one of his eyes.

When arrived at a proper age for grammatical instruction, he was placed in the free school of Litchfield, of which one Mr Hunter was then master; a man whom his illustrious pupil thought " very fevere, and wrong headedly severe, ' because he would beat a boy for not answering questions which he could not expect to be asked. He was, however, a skilful teacher; and Johnson, when he flood in the very front of learning, was fenfible how much he owed to him; for upon being asked how he had acquired so accurate a knowledge of the Latin tongue, he replied, " My mafter beat me very well; without that, Sir, I should have done nothing."

At the age of 15 Johnson was removed from Lichfield to the school of Stourbridge in Worcestershire, as which he remained little more than a year, and then returned home, where he flaid two years without any fettled plan of life or any regular course of study. He read, however, a great deal in a defultory manner, as chance threw books in his way, and as inclination directed him through them; fo that when in his 19th year he was entered a commoner of Pembroke college Oxford, his mind was stored with a variety of such knowledge as is not often acquired in univerfities, where boys feldom read any books but what are put into their hands by their tutors. He had given very early proofs ham: but this he refused, as inadequate to his services of his poetical genius both in his school exercises and

Johnson, in other occasional compositions; but what is perhaps tumn of which Johnson himself was compelled to leave Johnson. more remarkable, as it shows that he must have Oxford. Yet the same author represents Dr Adams thought much on a fubject on which other boys of as faying, "I was Johnson's nominal tutor, but he was that age feldom think at all, he had before he was 14 entertained doubts of the truth of revelation. From the melancholy of his temper these would naturally prey upon his spirits, and give him great uneafiness: but they were happily removed by a proper course of reading (A); for " his studies being honest, ended in conviction. He found that religion is true; and what he had learned, he ever afterward endeavoured to reach."

Concerning his refidence in the university, and the means by which he was there supported, his two principal biographers contradict each other; fo that these are points of which we cannot write with certainty. According to Sir John Hawkins, the time of his continuance at Oxford is divisible into two periods: Mr Boswell represents it as only one period, with the usual interval of a long vacation. Sir John fays, that he was supported at college by Mr Andrew Corbet in quality of affiftant in the studies of his fon: Mr Bofwell affures us, that though he was promifed pecuniary aid by Mr Corbet, that promife was not in any degree fulfilled. We should be inclined to adopt the knight's account of this transaction, were it not palpably inconfistent with itself. He says, that the two young men were entered in Pembroke on the same day; that Corbet continued in the college two years; and yet that Johnson was driven home in little more than one year, because by the removal of Corbet he was deprived of his pension. A story, of which one part contradicts the other, cannot wholly be true. Sir Tohn adds, that " meeting with another fource, the bounty, as it is supposed, of some one or more of the members of the cathedral of Lichfield, he returned to college, and made up the whole of his relidence in the university about three years." Mr Boswell has told us nothing but that Johnson, though his father was unable to support him, continued three years in college, and was then driven from it by extreme poverty.

These gentlemen differ likewise in their accounts of Johnson's tutors. Sir John Hawkins fays that he had two, Mr Jordan and Dr Adams. Mr Boswell affirms that Dr Adams could not be his tutor, because Jordan did not quit the college till 1731; the year in the au-

Vol. IX. Part I.

above my mark :" a speech of which it is not easy to discover the meaning, if it was not Johnson's duty to attend Adams's lectures. In most colleges we believe there are two tutors in different departments of edncation; and therefore it is not improbable that Iordan and Adams may have been tutors to Johnson at the fame time, the one in languages, the other in science. Jordan was a man of fuch mean abilities, that though his pupil loved him for the goodness of his heart, he would often rifk the payment of a small fine rather than attend his lectures; nor was he studious to conceal the reason of his absence. Upon occasion of one fuch imposition, he said, "Sir, you have sconced me two-pence for non-attendance at a lecture not worth a penny." For some transgression or absence his tutor imposed upon him as a Christmas exercise the task of translating into Latin verse Pope's Messiah; which being shown to the author of the original, was read and returned with this encomium, " The writer of this poem will leave it a question for posterity, whether his or mine be the original " The particular course of his reading while in college and during the vacation which he passed at home, cannot be traced. That at this period he read much, we have his own evidence in what he afterwards told the king; but his mode of fludy was never regular, and at all times he thought more than he read. He informed Mr Boswell, that what he read folidly at Oxford was Greek, and that the fludy of which he was most fond was metaphysics.

It was in the year 1731 that Johnson left the univerfity without a degree; and as his father, who died in the month of December of that year, had fuffered great misfortunes in trade, he was driven out a commoner of nature, and excluded from the regular modes of profit and profperity. Having therefore not only a profession but the means of subsistance to seek, he accepted, in the month of March 1732, an invitation to the office of under-mafter of a free school at Market Bosworth in Leicestershire: but not knowing, as he faid, whether it was more difagre able for him to teach or for the boys to learn the grammar-rules, and being likewise disgusted at the treatment which he received from the patron of the school, he relinquished

⁽A) Mrs Piozzi fays, that at the age of 10 Johnson's mind was diffurbed by scruples of infidelity, which preyed upon his spirits and made him very uneasy, and that they were afterwards removed by the sludy of Grotius de veritate, &c. This account of the early flate of Johnson's mind with respect to religion, Mr Boswell affects to turn into ridicule, as if it were a thing absolutely impossible that a boy of 10 years should have any religious scruples. He says, that Johnson became inattentive to religion at nine; talked, but did not think much, against it at 14; and was first made to think about it in earnest by a casual perusal of Law's ferious call to the unconverted, which he had taken up with a view to laugh at it. That it is not common for boys of to to have feruples of infidelity, must be granted; but that some have had them so early, the writer of this article knows by the most complete evidence; and if that be admitted of Johnson which has been true of others, Mrs Piozzi's narrative is natural, and honourable to him of whom it is written. But that a melancholy person should talk without thinking against religion, or that he should think against it with a disposition to laughter, and not be at the time a confirmed athieff, is in itself so extremely incredible, that we cannot help suspecting Mr Boswell to have on this occasion militaken the words of his great friend. "Law's serious call" is a very good book; but furely it is not fo well adapted to carry conviction to a reasoning mind as Grotius de veritate; and there is in Mr Bofwell's two volumes fufficient evidence that Johnson was of our opinion.

Johnson. in a few months a fituation which he ever afterwards prefaces, esfays, reviews of books, and poems; and Johnson

pocket, he translated Lobo's voyage to Abysfinia, for the trifling fum, it is faid, of five guineas, which he received from a bookfeller in Birmingliam. This was the first attempt which it is certain he made to procure pecuniary affiftance by means of his pen; and it must have held forth very little encouragement to his

commencing author by profession.

In 1735, being then in his 26th year, he married Mrs Porter, the widow of a mercer in Birmingham; whose age was almost double his; whose external form, according to Garrick and others, had never been captivating; and whose fortune amounted to hardly 800l. That the had a fuperiority of understanding and talents is extremely probable, both because she certainly inspired him with a more than ordinary passion, and because the was herfelf to delighted with the charms of his conversation as to overlook his external disadvantages, which were many and great. He now fet up a private well fituated near his native city: but his name having then nothing of that celebrity which afterwards commanded the attention and respect of mankind, this undertaking did not succeed. The only pupils who are known to have been placed under his care, were the celebrated David Garrick, his brother George Garrick, and a young gentleman of fortune whose name was and it was during that time that he conftructed the plan and wrote a great part of his tragedy of Irene.

The respectable character of his parents and his own merit had fecured him a kind reception in the best families at Lichfield; and he was particularly diffinguished by Mr Walmsley register of the ecclesiastical court, a man of great worth and of very extensive and the author's name was Johnson, and that he was an various erudition. That gentleman, upon hearing part obfcure person, replied, "he will soon be deterre." of Irene read, thought fo highly of Johnson's abilities as a dramatic writer, that he advised him by all means 1739, are filled with keen fatire on the government: to finish the tragedy and produce it on the stage. To and though Sir John Hawkins has thought fit to demen of genius the stage holds forth temptations almost clare that they display neither learning nor wit, Pope refiftless. The profits arising from a tragedy, including the representation and printing of it, and the connec- ferved by Mr Boswell, he says, that "the whole of the tions which it fometimes enables the author to form, were in Johnson's imagination inestimable. Flattered, it may be supposed, with these hopes, he set out some husband, now lived sometimes in one place and sometime in the year 1737 with his pupil David Garrick times in another, sometimes in the city and sometimes for London, leaving Mrs Johnson to take care of the at Greenwich: but Johnson himself was oftener to be house and the wreck of her fortune. The two adven- found at St John's Gate, where the Gentleman's Maturers carried with them from Mr Walmfley an earnest gazine was published, than in his own lodgings. It was recommendation to the reverend Mr Colfon, then ma- there that he became acquainted with Savage, with fter of an academy, and afterwards Lucafian professor of mathematics in the univerfity of Cambridge; but from that gentleman it does not appear that Johnson found either protection or encouragement.

How he fpent his time upon his first going to London is not particularly known. His tragedy was refused by the managers of that day; and for fome years the his various communications to that far-famed mifcellany, can afford. Suffice it to fay, that his connection with all fuch patriots, "refolved that they would fland by Cave the proprietor became very close; that he wrote their country!" In 1744, he published the life of his

recollected with horror. Being thus again without any that he was occasionally employed in correcting the fixed employment, and with very little money in his papers written by other correspondents. When the complaints of the nation against the administration of Sir Robert Walpole became loud, and a motion was made, February 13th 1740-1, to remove him from his majefty's counfels for-ever, Johnson was pitched upon by Cave to write what was in the Magazine entitled Debates in the Senate of Lilliput, but was underflood to be the speeches of the most eminent members in both houses of parliament. These orations, which induced Voltaire to compare British with ancient eloquence, were hastily sketched by Johnson while he was not yet 32 years old, while he was little acquainted with life, while he was ftruggling not for diffinction but for existence. Perhaps in none of his writings has he given a more conspicuous proof of a mind prompt and vigorous almost beyond conception: for they were composed from scanty notes taken by illiterate persons employed to attend in both houses; and sometimes he had nothing communicated to him but the names of academy; for which purpose he hired a large house the several speakers, and the part which they took in the debate.

His feparate publications which at this time attracted the greatest notice were, " London, a Poem in imitation of Juvenal's third Satire ;" " Marmor Norfolcienfe, or an Essay on an ancient prophetical Inscription in Monkish Rhyme, lately discovered near Lynne in Norfolk;" and "A complete Vindication of the Li-Offely. He kept his academy only a year and a half; cenfers of the Stage from the malicious and scandalous afperfions of Mr Brook author of Gustavus Vasa." The poem, which was published 1738 by Dosley, is univerfally known and admired as the most spirited instance in the English language of ancient sentiments adapted to modern topics. Pope, who then filled the poetical throne without a rival, being informed that The other two pamphlets, which were published in was of a different opinion; for in a note of his pre-Norfolk prophecy is very humorous."

Mrs Johnson, who went to London soon after her whom he was induced, probably by the fimilarity of their circumstances, to contract a very close friendship; and such was their extreme necessities, that they have often wandered whole nights in the street for want of money to procure them a lodging. In one of these nocturnal rambles, when their distress was almost incredible, so far were they from being depressed Gentleman's Magazine seems to have been his principal by their situation, that in high spirits and brimful of refource for employment and support. To enumerate patriotism, they traversed St James's Square for several hours, inveighed against the minister; and, as would extend this article beyond the limits which we Johnson said in ridicule of himself, his companion, and Johnson unfortunate companion; a work which, had he never upon it seven; for we know that it was begun in 1747, Johnson, written any thing elfe, would have placed him very and the last since the tothe peels in the end of high in the rank of authors (8). His narrative is 1e-markably smooth and well disposed, his observations undertaking, it is indeed altonshining that it was finishare jult, and his reflections disclose the minor recesses as the form of the control of

of the human heart.

In 1749, when Drury-lane theatre was opened under the management of Garrick, Johnson wrote a prologue for the occasion; which for just dramatic criticifm on the whole range of the English stage, as well as for poetical excellence, is confessedly unrivalled. But this year is, in his life, diffinguished as the epoch when his arduous and important work, the Dictionary of the English Language, was announced to the world by the publication of its plan or prospectus, addressed to the earl of Chesterfield. From that nobleman Johnson was certainly led to expect patronage and encouragement; and it feems to be equally certain that his lordship expected, when the book should be published, to be honoured with the dedication. The expectations of both were disappointed. Lord Chesterfield, after seeing the lexicographer once or twice, fuffered him to be repulfed from his door : but afterwards thinking to conciliate him when the work was upon the eve of publication, he wrote two papers in "The World," warmly recommending it to the public. This artifice was feen through; and Johnson, in very polite language, rejected his Lordship's advances, letting him know, that he was unwilling the public flould confider him as owing to a patron that which Providence had enabled him to do for himself. This great and laborious work its author expected to com plete in three years: but he was certainly employed

upon it feven; for we know that it was begun in 7/47, and the laft thect was fent to the prefs in the end of the year 17/54. When we confider the nature of the undertaking, it is indeed alkonithing that it was finished fo foon, fince it was written, as he fays, " with little affiliance of the learned, and without any patronage of the great; not in the fost obscurities of retirement, or under the fletter of academic bowers, but amidth inconvenience and diffraction, in ficknefs and in forrow." The forrow, to which he here alludes, is probably that which he felt for the lofs of his wife, who died on the 17th of March O. S. 1752, and whom he continued to lament as long as he lived.

The Dictionary did not occupy his whole time : for while he was pushing it forward, he fitted his Tragedy for the stage; wrote the lives of feveral eminent men for the Gentleman's Magazine; published an Imitation of the 10th Satire of Juvenal, intitled "The Vanity of human Wishes;" and began and finished "The Rambler." This last work is fo well known, that it is hardly necessary to fay that it was a periodical paper, published twice a-week, from the 20th of March 1750 to the 14th of March 1752 inclusive: but to give our readers fome notion of the vigour and promptitude of the author's mind, it may not be improper to observe, that notwithstanding the severity of his other labours, all the affiftance which he received does not amount to five papers; and that many of the most masterly of those unequalled essays were written on the spur of the occasion, and never feen entire by the author till they returned to him from the press (c).

Soon after the Rambler was concluded, Dr Hawkef-

(a) From the merit of this work Mr Bofwell has endeavoured to detract, by infiniating, that the person called Richard Savage was an impostor, and not the fon of the earl of Rivers and the counters of Macclesfield. See our account of Savage.

⁽c) The ftyle of the Rambler has been much praifed and much cenfured, fometimes perhaps by men who paid little attention to the author's views. It has been compared with the flyle of Addison; to which it is thought superior by some, and inferior by others. Its defects have been petulantly caricatured, and its merits unduly exalted. To attempt a defence of all the words in it which are derived from the Latin, would be in vain; for though many of them are elegant and exprefive, others are harsh, and do not easily affimilate with the English idiom. But it would be as easy to defend the use of Johnson's words as the structure of all Addison's sentences; for though many of these are exquisitely beautiful, it must be confessed that others are feeble, and offend at once the ear and the mind. An ingenious essayist says, that in the Rambler "the constant recurrence of sentences in the form of what have been called triplets, is disgusting to all readers." The recurrence is indeed very frequent'; but it certainly is not conflant, nor we hope always difgufting: and as what he calls the triplet is unquestionably the most energetic form of which an English sentence is susceptible, we cannot help thinking, that it fould frequently recur in detached effays, of which the object is to inculcate moral truths. He who reads half a volume of the Rambler at a fitting, will feel his ear fatigued by the close of fimilar periods fo frequently recurring; but he who reads only one paper in the day, will experience nothing of this wearinefs. For purposes merely didactic, when something is to be told that was not known before, Addison's ftyle is certainly preferable to Johnson's, and Swift's is preferable to both: but the question is, Which of them makes the best provision against that inattention by which known truths are suffered to lie neglected? There are very few moral truths in the Spectator or in the Rambler of which the reader can be totally ignorant; but there are many which may have little influence on his conduct, because they are feldom the objects of his thought. If this be fo, that flyle should be considered as best which most rouses the attention, and impresses deepest in the mind the fentiments of the author: and therefore, to decide between the style of Addison and that of Johnson, the reader should compare the effects of each upon his own memory and imagination, and give the preference to that which leaves the most lasting impression. But it is said that Johnson himself must have recognized the fault of perpetual triplets in his style, since they are by no means frequent in his last productions. Is this a fair flate of the case? His last production was "the Lives of the British Poets," of which a great part confilts of the narration of facts; and fuch a narration in the flyle of the Rambler would be ridi-

Johnson, worth projected "The Adventurer" upon a similar plan; and by the affiftance of friends he was enabled to carry it on with almost equal merit. For a short time, indeed, it was the most popular work of the two; and the papers with the fignature T, which are confessedly the most splendid in the whole collection, are now known to have been communicated by Johnson, who received for each the sum of two guineas. This was double the price for which he fold fermons to fuch clergymen as either would not or could not compose their own discourses; and of sermonwriting he feems to have made a kind of trade.

Though he had exhausted, during the time that he was employed on the Dictionary, more than the fum for which the booksellers had bargained for the copy; vet by means of the Rambler, Adventurer, fermons, and other productions of his pen, he now found himself in greater affluence than he had ever been before; and as the powers of his mind, diftended by long and fevere exercise, required relaxation to restore them to their proper tone, he appears to have done little or nothing from the closing of the Adventurer till the year 1756, when he submitted to the office of reviewer in the Literary Magazine. Of his reviews by far the most valuable is that of Soame Jennyns's "Free Inquiry into the Nature and Origin of Evil." Never were wit and metaphysical acuteness more closely united than in that criticism, which exposes the wakness and holds up to contempt the reasonings of those vain mortals, who presumptuoufly attempt to grasp the scale of existence, and to form plans of conduct for the Creator of the universe. But the furnishing of magazines, reviews, and even newspapers with literary intelligence, and authors of books with dedications and prefaces, was confidered as an employment unworthy of Johnson. It was therefore proposed by the booksellers that he should give a new edition of the dramas of Shakespeare; a work which he had projected many years before, and of which he had published a specimen which was commended by Warburton. When one of his friends expressed a hope that this employment would furnish him with amusement and add to his fame, he replied, "I look upon it as I did upon the Dictionary; it is all work; and my inducement to it is not love or defire of fame, but the want of money, which is the only motive to writing that I know of." He iffued propofals, however, of confiderable length; in which he showed that he knew perfectly what a variety of refearch fuch an undertaking required: but his indolence prevented him from purfuing it with diligence, and it was not published till many years afterwards.

On the 15th of April 1758 he began a new periodical paper intitled " The Idler," which came out every Saturday in a weekly newspaper, called "the Univerfal Chronicle, or Weekly Gazette," published by Newberry. Of these essays, which were continued till the 5th of April 1760, many were written as hastily as an

ordinary letter; and one in particular composed at Johnson. Oxford was begun only half an hour before the departure of the post which carried it to London. About this time he had the offer of a living, of which he might have rendered himfelf capable by entering into orders. It was a rectory in a pleasant country, of fuch yearly value as would have been an object to one in much better circumstances; but sensible, as it is supposed, of the asperity of his temper, he declined it, faying, " I have not the requifites for the office, and I cannot in my confcience shear the flock which I am unable to feed."

In the month of January 1759 his mother died at the great age of qo; an event which deeply affected him, and gave birth to the 41st Idler, in which he laments. that "the life which made his own life pleasant was at an end, and that the gate of death was that upon his prospects" Soon afterwards he wrote his " Rasselas Prince of Abyffinia;" that with the profits he might defray the expence of his mother's funeral, and pay fome debts which she had left. He told a friend, that he received for the copy 100l. and 25l. more when it came to a fecond edition; that he wrote it in the evenings of one week, fent it to the prefs in portions as it was written, and had never fince read it

Hitherto, notwithstanding his various publications, he was poor, and obliged to provide by his labour for the wants of the day that was passing over him; but having been early in 1762 represented to the king as a very learned and good man without any certain provision, his majesty was pleased to grant him a pension, which Lord Bute, then first minister, assured him " was not given for any thing which he was to do, but for what he bad already done." A fixed annuity of three hundred pounds a-year, if it diminished his distress, increased his indolence; for as he constantly avowed that he had no other motive for writing than to gain . money, as he had now what was abundantly fufficient for all his purposes, as he delighted in conversation. and was vifited and admired by the witty, the elegant, and the learned, very little of his time was past in folitary study. Solitude was indeed his aversion; and that he might avoid it as much as possible, Sir Joshua Reynolds and he, in 1764, instituted a club, which existed long without a name, but was afterwards known by the title of the Literary Club. It confifted of some of the most enlightened men of the age, who met at the Turk's Head in Gerard-street Soho one evening in every week at feven, and till a late hour enjoyed "the feaft of reason and the flow of foul."

In 1765, when Johnson was more than usually opprefied with conftitutional melancholy, he was fortunately introduced into the family of Mr Thrale, one of the most eminent brewers in England, and member of parliament for the borough of Southwark : and it is but justice to acknowledge, that to the affistance

culous. Cicero's orations are univerfally admired; but if Cæsar's commentaries had been written in that style, who would have read them? When Johnson in his biography has any important truth to enforce, he generally employs the rounded and vigorous periods of the Rambler; but in the bare narration he uses a simpler style, and that as well in the life of Savage, which was written at an early period, as in the lives of those which were written lateft. It is not, however, very prudent in an ordinary writer to attempt a close imitation of the flyle of the Rambler; for Johnson's vigorous periods are fitted only to the weight of Johnson's thoughts.

which their house afforded him for 16 or 17 years, and to the pains which they took to foothe or reprefs his uneafy fancies, the public is probably indebted for fome of the most masterly as well as most popular works which he ever produced. At length, in the October of this year, he gave to the world his edition of Shakespeare, which is chiefly valuable for the preface, where the excellencies and defects of that immortal bard are displayed with such judgment, as must please every man whose taste is not regulated by the Handard of fashion or national prejudice. In 1767 he was honoured by a private conversation with the king in the library at the queen's house; and two years afterwards, upon the establishment of the royal academy of painting, sculpture, &c. he was nominated professor of ancient literature; an office merely honorary, and conferred on him, as is supposed, at the ledge that it is uncommonly happy, and that the whole recommendation of his friend the prefident.

In the variety of fubjects on which he had hitherto exercifed his pen, he had forborne, fince the adminifration of Sir Robert Walpole, to meddle with the disputes of contending factions; but having seen with indignation the methods which, in the business of Mr Wilkes, were taken to work upon the populace, he published in 1770 a pamphlet, intitled "The False Alarm;" in which he afferts, and labours to prove by a variety of arguments founded on precedents, that the expulsion of a member of the house of commons is equivalent to exclusion, and that no such calamity as the subversion of the constitution was to be feared from an act warranted by ufage, which is the law of parliament. Whatever may be thought of the principles maintained in this publication, it unquestionably contains much wit and much argument, expressed in the author's best style of composition; and yet it is known to have been written between eight o'clock on Wednefday night and twelve o'clock on the Thursday night, when it was read to Mr Thrale upon his coming from the house of commons. In 1771 he published another political pamphlet, intitled, " Thoughts on the late transactions respecting Falkland's Islands:" in which he attacked Junius: and he ever afterwards delighted himfelf with the thought of having deftroved that able writer, whom he certainly furpaffed in neryous language and pointed ridicule.

In 1773 he visited with Mr Boswell some of the most considerable of the Hebrides or Western Islands of Scotland, and published an account of his journey in a volume which abounds in extensive philosophical views of fociety, ingenious fentiments, and lively defcription, but which offended many perfons by the violent attack which it made on the authenticity of the poems attributed to Offian. For the degree of offence that was taken, the book can hardly be thought to contain a fufficient reason: if the antiquity of these poems be yet doubted, it is owing more to the conduct of their editor than to the violence of Johnson. In 1774, the parliament being diffolved, he addreffed to the electors of Great Britain a pamphlet, intitled "The Patriot;" of which the defign was to guard them from imposition, and teach them to distinguish true from false patriotism. In 1775 he published " Taxation no tyranny; in answer to the resolutions and address of the American Congress." In this

Johnson. which Mr and Mrs Thrale gave him, to the shelter performance his admirer Mr Boswell cannot, he says, Johnson. perceive that ability of argument or that felicity of expression for which on other occasions Johnson was so eminent. This is a singular criticism. To the assumed principle upon which the reasoning of the pamphlet refts many have objected, and perhaps their objections are well founded; but if it be admitted that " the Supreme Power of every community has the right of requiring from all its fubiects fuch contributions as are neceffary to the public fafety or public prosperity," it will be found a very difficult task to break the chain of arguments by which it is proved that the British parliament had a right to tax the Ame-As to the expression of the pamphlet, the reader, who adopts the maxim recorded in the " Journal of a tour to the Hebrides," that a controvertift " ought not to strike fost in battle," must acknowperformance is one of the most brilliant as well as most correct pieces of composition that ever fell from the pen of its author. These effavs drew upon him numerous attacks, all of which he heartily despised; for though it has been supposed that " A letter addressed to Dr Samuel Johnson occasioned by his political publications," gave him great uneafiness, the contrary is manifest, from his having, after the appearance of that letter, collected them into a volume with the title of " Political Tracts by the author of the Rambler." In 1765 Trinity College Dublin had created him LL.D. by diploma, and he now received the fame honour from the University of Oxford; an honour with which, though he did not boast of it, he was highly gratified. In 1777 he was induced, by a case of a very extraordinary nature, to exercise that humanity which in him was obedient to every call. Dr William Dodd, a clergyman, under fentence of death for the crime of forgery, found means to interest Johnson in his behalf, and procured from him two of the most energetic compositions of the kind ever feen; the one a petition from himself to the king, the other a like address from his wife to the queen. These petitions failed of fuccefs.

The principal bookfellers in London having determined to publish a body of English poetry, Johnson was prevailed upon to write the lives of the poets, and give a character of the works of each. This talk he undertook with alacrity, and executed it in fuch a manner as must convince every competent reader, that as a biographer and a critic, no nation can produce his equal. The work was published in ten small volumes, of which the first four came abroad 1778, and the others in 1781. While the world in general was filled with admiration of the stupendous powers of that man, who at the age of feventy-two, and labouring under a complication of difeases, could produce a work which displays so much genius and so much learning; there were narrow circles in which prejudice and refentment were foftered, and whence attacks of different forts iffued against him. These gave him not the smallest disturbance. When told of the feeble. though shrill, outcry that had been raised, he said-" Sir, I confidered myfelf as entrufted with a certain portion of truth. I have given my opinion fincerely : let them show where they think me wrong.'

He had hardly begun to reap the laurels gained by this

Johnson. this performance, when death deprived him of Mr made to account for it in various ways; but doubtless Johnson. Thrale, in whose house he had enjoyed the most comfortable hours of his life; but it abated not in Johnfon that care for the interests of those whom his friend had left behind him, which he thought himfelf bound to cherish, both in duty as one of the executors of his will, and from the nobler principle of gratitude. On this account, his visits to Streatham, Mr Thrale's villa, were for some time after his death regularly made on Monday and protracted till Saturday, as they had been during his life; but they foon became less and less frequent, and he studiously avoided the mention of the place or the family. Mrs Thrale, now Piozzi, fays indeed, that " it grew extremely perplexing and difficult to live in the house with him when the master of it was no more ; because his dislikes grew capricious, and he could fearce bear to have any body come to the house whom it was absolutely necessary for her to see." The person whom she thought it most necessary for her to fee may perhaps be gueffed at without any fuperior fhare of fagacity; and if these were the visits which Johnson could not bear, we are so far from thinking his diflikes capricious, though they may have been perplexing, that if he had acted otherwise, we should have blamed him for want of gratitude to the friend whose " face for fifteen years had never been turned

upon him but with respect or benignity."

About the middle of June 1783 his conflitution fultained a severer shock than it had ever before felt, by a stroke of the palfy; so sudden and so violent, that it awakened him out of a found fleep, and rendered him for a short time speechless. As usual, his recourse under this affliction was to piety, which in him was conflant, fincere, and fervent. He tried to repeat the Lord's prayer first in English, then in Latin, and afterwards in Greek : but succeeded only in the last attempt; immediately after which he was again deprived of the power of articulation. From this alarming attack he recovered with wonderful quickness, but it left behind it some presages of an hydropic affection; and he was foon afterwards feized with a spasmodic ashma of such violence that he was confined to the house in great pain, while his dropfy increased notwithstanding all the efforts of the most eminent physicians in London and Edinburgh. He had, however, fuch an interval of ease as enabled him in the summer 1784 to visit his friends at Oxford, Lichfield, and Ashbourne in Derbyshire. The Romish religion being introduced one day as the topic of conversation' when he was in the house of Dr Adams, Johnson faid, " If you join the papifts externally, they will not interrogate you frictly as to your belief in their tenets. No reasoning papist believes every article of their faith. There is one fide on which a good man might be perfuaded to embrace it. A good man of a timorous disposition, in great doubt of his acceptance with God, and pretty credulous, might be glad of a church where there are fo many helps to go to heaven. I would be a papift if I could. I have fear enough; but an obstinate rationality prevents me. I shall newer be a papist unless on the near approach of death, of which I have very great terror."

His conflant dread of death was indeed fo great, that it aftonished all who had access to know the piety of his mind and the virtues of his life. Attempts have bee

that is the true account which is given in the Olla Podrida, by an elegant and pious writer, who now adorns a high station in the church of England. " That he should not be conscious of the abilities with which Providence had bleffed him, was impossible. He felt his own powers; he felt what he was capable of having performed; and he faw how little, comparatively fpeaking, he had performed. Hence his apprehension on the near prospect of the account to be made, viewed through the medium of conflitutional and morbid melancholy, which often excluded from his fight the bright beams of divine mercy." This, however, was the case only while death was approaching from some distance. From the time that he was certain it was near. all his fears were calmed; and he died on the 13th of December 1784, full of refignation, strengthened by

faith, and joyful in hope.

For a just character of this great man our limits afford not room: we must therefore content ourselves with laying before our readers a very short sketch. His stature was tall, his limbs were large, his ftrength was more than common, and his activity in early life had been greater than fuch a form gave reason to expect : but he was subject to an infirmity of the convulsive kind. refembling the diftemper called St Vitus's dance; and he had the feeds of fo many difeafes fown in his conflitution, that a short time before his death he declaredthat he hardly remembered to have passed one day wholly free from pain. He poffeffed very extraordinary powers of understanding; which were much cultivated by reading, and still more by meditation and reflection. His memory was remarkably retentive. his imagination uncommonly vigorous, and his judgment keen and penetrating. He read with great rapidity, retained with wonderful exactness what he for eafily collected, and poffeffed the power of reducing to order and fystem the scattered hints on any subject which he had gathered from different books. It would not perhaps be fafe to claim for him the highest place, among his contemporaries, in any fingle department of literature; but, to use one of his own expressions, he brought more mind to every fubject, and had a greater variety of knowledge ready for all occasions, than any other man that could be easily named. Though prone to superstition, he was in all other respects so remarkably incredulous, that Hogarth said, while Johnson firmly believed the bible, he seemed determined to believe nothing but the bible. Of the importance of religion he had a strong sense, and his zeal for its interests were always awake, fo that profanenels of every kind was abashed in his presence. The same energy which was displayed in his literary productions, was exhibited also in his conversation, which was various, firiking, and infructive : like the fage in Raffelas, he spoke, and attention watched his lips; he reasoned, and conviction closed his periods; when he pleafed, he could be the greatest fophist that ever contended in the lifts of declamation; and perhaps no man ever equalled him in nervous and pointed repartees. His veracity from the most trivial to the most folemn occasions, was strict even to severity : he fcorned to embellish a story with fictitious circumstances; for what is not a representation of reality, he used to say, is not worthy of our attention. As his purfe

was his heart tender to those who wanted relief, and Suspiria on the Doctor's death: his foul was fusceptible of gratitude and every kind impression. He had a roughness in his manner which fundued the faucy and terrified the meek: but it was only in his manner: for no man was more loved than Johnfon was by those who knew him; and his works will be read with veneration for their author as long as the language in which they are written shall be underflood.

IOHNSTON, or Tonnson (John), a learned divine, born in 1662. He was zealous for the Revolution, and preached a noted fermon at Feversham on the occasion, from the words, " Remember Lot's wife;" wherein he fet forth the great danger of looking back, and vindicated the liturgy against Mr Baxter and others. He published The Glergyman's Vade Mecum, and A Collection of Ecclesiastical Laws as a continuation of it; but catching the infection spread by Dr Sachaverel, he, on the accession of Geo. I. to the amazement of all his old friends, entertained unfavourable thoughts of the Protestant succession, and resused to read the usual prayers for the king. Being prosecuted, however, he thought proper to submit; and died vicar of

Cranbrook in Kent, in 1725. JOHNSTON (Dr Arthur), was born at Caskieben, near Aberdeen, the seat of his ancestors, and probably was educated at Aberdeen, as he was afterwards advanced to the highest dignity in that university. The study he chiefly applied himself to was that of physic; and to improve himself in that science, he travelled into foreign parts. He was twice at Rome; but the chief place of his residence was Padua, in which university the degree of M. D. was conferred on him in 1610, as appears by a MS. copy of verses in the advocate's library in Edinburgh. After leaving Padua, he travelled through the rest of Italy, and over Germany, Denmark, England, Holland, and other countries; and at length fettled in France; where he met with great applause as a Latin poet. He lived there 20 years, and by two wives had 13 children. After 24 years absence, he returned into Scotland in 1632. It appears by the Council Books at Edinburgh, that the Doctor had a fuit at law before that court about that time. In the year following, it is very well known that Charles I. went into Scotland, and made bishop Laud, then with him, a member of that council: and by this accident, it is probable, that acquaintance began between the doctor and that prelate, which produced his " Pfalmorum Davidis Paraphrafum Poëtica :" for we find that, in the same year, the doctor printed a specimen of his Pfalms at London, and dedicated them to his lordship.

He proceeded to perfect the whole, which took him up four years; and the first edition complete was published at Aberdeen in 1637, and at London the the same year. In 1641, Dr. Johnston being at Oxford, on a vifit to one of his daughters who was married to a divine of the church of England in that place, was feized with a violent diarrhoea, of which he died in a few days, in the 54th year of his age, not without having feen the beginning of those troubles that proved fo fatal to his patron. He was buried in the place where he died; which gave occasion to the fol-

Johnson. purfe and his house were ever open to the indigent, so lowing lines of his learned friend Wedderburn in his Joigny Toinville.

Scotia motha, dole, tanti viduata fepulchro Vatis; is Angligenis contigit altus honos.

In what year Dr. Johnston was made physician to the kind does not appear; it is most likely that the archbishop procured him that honour at his coming into England in 1633, at which time he translated Solomon's Song into Latin elegiac verse, and dedicated it to his majesty. His Pfalms were reprinted at Middleburgh, 1642; London, 1657; Cambridge,; Amsterdam, 1706; Edinburgh, by William Lauder, 1730; and last on the plan of the Delphin classics, at London, 1741, 8vo, at the expence of auditor Benfon, who dedicated them to his late majefty, and prefixed to this edition memoirs of Dr Johnston, with the testimonies of various learned persons. A laboured comparison between the two translations of Buchanan and Johnston was printed the same year in English, in 8vo, intituled, "A Prefatory Discourse to Dr "Johnston's Psalms, &c." and "A Conclusion to it." His translations of the Te Deum, Creed, Decalogue, &c. were subjoined to the Pfalms. His other poetical works are his Epigrams; his Parerga; and his Mufe Anglica, or commendatory Verses upon persons of rank in church and flate at that time.

JOIGNY, a town of France, in Champagne, and in the diocese of Sens, with a very handsome castle. It consists of three parishes, and is pleasantly situated on the river Yonne, in E. Long. 3. 25. N. Lat. 47. 56.

JOINERY, the art of working in wood, or of fitting various pieces of timber together. It is called by the French menuiferie, "fmall work," to diftinguish it from carpentery, which is employed about large and lefs curious works.

JOINT, in general, denotes the juncture of two or more things. The joints of the human body are called by anatomists articulations. See ANATOMY,

The fuppleness to which the joints may be brought. by long practice from the time of infancy, is very furprifing. Every common posture-master shows us a great deal of this; but one of the most wonderful inflances we ever had of it, was in a person of the name of Clark, and famous for it in London, where he was commonly known by the name of Clerk the posluremafter. This man had found the way, by long practice, to diffort many of the bones, of which nobody before had ever thought it possible to alter the posttion. He had fuch an absolute command of his muscles and joints, that he could almost disjoint his whole body; fo that he once imposed on the famous Mullens by his diffortions, in fuch a manner, that he refused to undertake his cure: but, to the amazement of the physician, no sooner had he given over his patient, than he faw him restore himself to the figure and condition of a proper man, with no diftortion about him.

JOINTURE, in law, generally fignifies a fettlement of lands and tenements, made on a woman in confideration of marriage.

JOINVILLE (John Sire de), an eminent French flatesman of the 13th century, who was seneschel or Toli.

Joinville high-fleward of Champagne, and one of the principal lords in the court of Lavis IX. He attended that monarch in all his expeditions; and had fo much confidence placed in him, that all matters of juffice in the palece were referred to his decision, and the king undertook nothing of confequence without confulting him. He wrote the history of St Lewis in French, which is a very curious and interesting piece; and died about the year 1318. The best edition of this work is that of Du Cange, in folio, with learned remarks.

JOINVILLE, an ancient and confiderable town of France, in Champagne, with the title of a principality, and a lage magnificent caftle. It is fituated on the river Marne, in E. Long. 5. 10. N. Lat. 48. 20.

IOISTS, or Joysts, in architecture, those pieces of timber framed into the girders and fummers, on

which the boards of the floor are laid. IOKES. See IESTING.

IOLAIA, a festival at Thebes, the same as that called Heracleia. It was inftituted in honour of Hercules and his friend Iolas, who affilted him in conquering the hydra. It continued during feveral days, on the first of which were offered folemn facrifices. The next day horse-races and athletic exercises were exhi-The following day was fet apart for wreftling, the victors were crowned with garlands of myrtle ge-

nerally used at funeral folemnities. They were sometimes rewarded with tripods of brass. The place where the exercises were exhibited was called Iolaion; where there were to be feen the monument of Amphitryon and the cenotaph of Iolas, who was buried in Sardinia. These monuments were strewed with gar-

lands and flowers on the day of the feftival.

IOLAS or IOLAUS, (fab. hift.) a fon of Iphiclus king of Theffaly, who affifted Hercules in conquering the Hydra, and burnt with a hot iron the place where the heads had been cut off, to prevent the growth of others. He was reftored to his youth and vigour by Hebe, at the request of his friend Hercules. Some time afterwards Iolas affifted the HERACLIDE against Euryftheus, and killed the tyrant with his own hand. According to Plutarch, Iolas had a monument in Bœotia and Phocis, where lovers used to go and bind them-felves by the most folemn oaths of fidelity, considering the place as facred to love and friendship. According to Diodorus and Paufanias, Iolas died and was buried in Sardinia, where he had gone to make a fettlement at the head of the fons of Hercules by the 50 daughters of Thespins.

JOLI, or Joly, (Claudius), a worthy parish-priest, and an excellent scholar, descended from a family eminent for learning and piety; was born at Paris in 1607. He applied himself first to the law, and pleaded for fome time at the bar; but inclining afterwards to the church, he entered into orders, and in 1631 obtained a canonry in the cathedral church of Notre Dame at Paris; the duties of which office he discharged with an exactness beyond all example as long as he lived. Discovering at the same time occasionally a capacity for state-affairs, the duke de Longueville, the French plenipotentiary for negociating a general peace, took Joly with him to Munfter, where he proved a good affiftant. On his return, he refumed his former

employments with his usual zeal. In 1671 he was

Nº 168.

made precentor in his church; and feveral times official of Paris, without his feeking : always behaving, as an ecclefiaftical magistrate, with perfect integrity, and testifying a fincere love for justice. He died in 1700, and left many works; in which, as in as many mirrors, his true character fully appears.

Iona

Jour (Guy), king's counfellor to the Chatelet, and fyndic of the revenues of the Hotel de Ville at Paris. attached himself for a long time to cardinal de Retz in the capacity of fecretary. Befide other tracts, he wrote Memoirs from 1648 to 1665, including those of Cardinal de Retz; a translation of which into English was

published in 1755.

JOLLOXOCHITL, or FLOWER OF THE HEART, in botany; a large beautiful flower growing in Mexico; where it is not less esteemed for its beauty than for its odour, which is fo powerful, that a fingle flower is fufficient to fill a whole house with the most pleafing fragrance. It has many petals, which are glutinous, externally white, internally reddiff or yellowish, and disposed in such a manner, that when the flower is open and its petals are expanded, it has the appearance of a star, but when shut it resembles in some measure a heart, from whence its name arose. The tree which bears it is tolerably large, and its leaves are long and rough.

ION, (fab. hift.), a fon of Xuthus and Creufa daughter of Erechtheus, who married Helice, the daughter of Selinus king of Ægiale. He succeeded to the throne of his father-in-law; and built a city, which he called Helice on account of his wife. His fubiects from him received the name of Ionians, and the country that

of Ionia. See IONIA.

Ion, a tragic poet of Chios, who flourished about the 82d Olympiad, His tragedies were represented at Athens, where they met with universal applause. He is mentioned and greatly recommended by Aristo-

phanes and Athenæus, &c.

IONA. JONA, or ICOLMKILL, one of the Hebrides ; a fmall, but celebrated island, " once the luminary of the Caledonian regions (as Dr Johnson expresses it), whence favage clans and roving barbarians derived the benefits of knowledge and the bleffings of religion." The name Iona is derived from a Hebrew word fignifying a dove, in allufion to its patron Columba, who landed here in 565. See COLUMBA .- It is faid to have been a feat of the druids before his arrival, when its name in Irish was Inis Drunish, or the " Druid Island." The druids being expelled or converted, he founded here a cell of canons regular, who till 716 differed from the church of Rome in the observance of Easter and in the tonfure. After his death, the island retained his name, and was called Ycolumb cill or "Columb's cell," now Icolmkill. The Danes dislodged the monks in the oth century, and Cluniacs were the next order that fettled here.

This island, which belongs to the parish of Ross in Mull, is three miles long, and one broad : the east fide is mostly flat; the middle rifes into fmall hills; and the west fide is very rude and rocky: the whole forming a fingular mixture of rock and fertility. There is in the island only one town, or rather village, confifting of about 60 mean houses. Near the town is the bay of Martyrs flain by the Danes. An oblong inclosure, bounded by a stone dyke and called Glachnan Druinach.

to have been a burial-place of the Druids, or rather the common cemetery of the towns-people. Beyond the town are the ruins of the nunnery of Austin canonesses, dedicated to St Oran, and faid to be founded by Columba: the church was 58 feet by 20, and the east roof is entire. On the floor, covered deep with cow-dung, is the tomb of the last prioress with her figure praying to the Virgin Mary, and this infeription on the ledge : Hic jacet domina Anna Donaldi Terleti filia, quondam priorissa de Jona, que obiit an'o mo do ximo cius animam Altissimo commendamus: and another inscribed, Hic jacet Mariota filia Johan : Lauchlain domini de. . . . A broad paved way leads hence to the cathedral; and on this way is a large handfome crofs called Macleane's, the only one that remains of 360, which were demolished here at the Reformation. Reilig Ouran, or the burying-place of Oran, is the large inclosure where the kings of Scotland, Ireland, and of the ifles, and their descendants, were buried in three feveral chapels. The dean of the ifles, who travelled over them 1549, and whose account has been copied by Buchanan, and published at Edinburgh 1784, fays, that in his time on one of these chapels (or "tombes of flain formit like little chapels with ane braid gray marble or quhin ftain on the gavil of ilk ane of the tombes," containing, as the chronicle fays, the remains of 48 Scotch monarches, from Fergus II. to Macbeth, 16 of whom were pretended to be of the race of Alpin), was inscribed, Tumulus regum Scotia. The next was inscribed, Tunulus regum Hibernia, and contained four Irish monarchs: and the 3d inscribed, Tumulus regum Norwegia, contained eight Norwegian princes or vicerovs of the Hebrides, while they were fubject to the crown of Norway. Boetius fays, that Fergus founded this abbey for the burial place of his fuccessors, and caused an office to be composed for the funeral ceremony. All that Mr Pennant could discover here were only certain slight remains, built in a ridged form and arched within, but the infcriptions loft. These were called Jornaire nan righ or "the ridge of the kings." Among these stones are to be feen only thefe two infcriptions in the Gaelic or Erse language and ancient Irish characters: Cros Domhail fat'afich, i. e. " the cross of Donald Longshanks" and that of Urchvine o Guin; and another inscribed Hic jacent quatuor priores de Hy, Johannes, Hugenius, Patricius, in decretis olim bacularius, qui obiit an. Dom. milles o quingentesimo. Above 300 inscriptions were collected here by Mr Sacheverel in 1688. and given to the earl of Argyle, but afterwards lost in the troubles of the family. The place is in a man-ner filled with grave-stones, but so over-grown with weeds, that few or none are at prefent to be feen, far less any inscriptions read. Here also stands the chapel of St Oran, the first bulding begun by Columba, which the evil fpirits would not fuffer to fland till fome human victim was buried alive; for which fervice Oran offered himself, and his red grave-stone is near the door. In this chapel are tombs of feveral chiefs, &c. A little north-west of the door is the pedestal of a crofs: on it are certain stones that feem to have been the suports of a tomb. Numbers who vifit this island think it incumbent on them to turn each of these thrice round, according to the course of the fun. Vol. IX. Part I.

Druinach, in which bones have been found, is supposed They are called Clacha-brath; for it is thought that the brath, or end of the world, will not arrive till the pedeftal on which they fland is worn through. Originally (favs Mr Sacheverel) here were three noble globes of white marble, placed on three ftone basons, and these were turned round; but the fynod ordered them and 60 croffes to be thrown into the fea. The prefent stones are probably fubstituted in place of these globes, The precinct of thefe tombs was held facred, and enjoyed the privileges of a girth or fanctuary. Thefe places of retreat were by the ancient Scotch law, not to fhelter indifcriminately every offender, as was the case in more bigotted times in Catholic countries; for here all atrocious criminals were excluded; and only the unfortunate delinquent, or the penitent finner, was shielded from the instant stroke of rigorous juflice. A little to the north of this inclosure stands the cathedral, built in form of a cross, 115 feet long by 23, the transept 70 feet: the pillars of the choir have their capitals charged with fcripture and other histories; and near the altar are the tombs of two abbots and a knight. A fragment remains of the altar-stone of white marble veined with grey. This church is afcribed to Maldwin in the 7th century ; but the present structure is far too magnificent for that age. Most of the walls are built of red granite from the Nun's island in the Sound. Two parallel walls of a covered way about 12 feet high and 10 wide, reach from the fouth-east corner to the fea. In the churchyard is a fine crofs of a fingle piece of red granite, 14 feet high, 22 broad, and 10 inches thick. Near the foutheast end is Mary's chapel. The monaftery is behind the chapel; of which only a piece of the cloiders remains, and fome facred black stones in a corner, on which contracts and alliances were made, and oaths fworn. East of it was the abbot's gardens and offices. North of this was the palace of the bishop of the ifles after the feparation of Man from them. This fee was endowed with 13 iflands; feveral of which were frequently taken away by the chieftains. The title of Soder, which fome explained Soter, Swing " the name of Christ, or Soder, an imaginary town," is really derived from the diffinction of the diocefe into the northern islands or Nordereys (i. e. all to the north of Adnamurchan point), and the Southern or Sudereys: which last being the most important, the isle of Man retained both titles.

Other ruins of monastic buildings and offices may be traced, as well as fome druidical fepulchral remains. Several abbeys were derived from this, which with the island was governed by an abbot-presbyter, who had rule even over bishops. The place where Columba landed is a pebbly beach, where a heap of earth reprefents the form of his ship. Near it is a hill with a circle of ftones called Cnoc-nar-aimgeal, or " the hill of angels," with whom the faint held conference; and on Michaelmas day the inhabitants courfed their horses round it, a remain of the custom of bringing them there to be bleffed. In former times, this island was the place where the archives of Scotland and many valuable old manuscripts were kept. Of these most are supposed to have been destroyed at the Reformation; but many, it is faid, were carried to the Scotch college at Douay in France, and it is hoped some of them may still be recovered. This once illustrious feat of learning and

piety has now no fchool for education, no temple for worship, no instructor in religion, unless visited by the

parish minister from another island.

IONAH, or Prophecy of JONAH, a canonical book of the Old Testament; in which it is related, that Ionah (about 771 B. C.) was ordered to go and prophecy the destruction of the Ninevites, on account of their wickedness. But the prophet, instead of obeying the divine command, embarked for Tarshish; when, a tempest arising, the mariners threw him into the sea: he was fwallowed by a great fish; and after being three days and nights in his belly, was cast upon the land. Hereupon being fensible of his past danger and surprifing deliverance, he betook himself to the journey and embaffy to which he was appointed; and arriving at Nineveh the metropolis of Affyria, he, according to his commission, boldly laid open their fins and miscarriages, and proclaimed their fudden overthrow: upon which the whole city, by prayer and fasting, and a speedy repentance, happily averted the divine vengeance, and escaped the threatened ruin. Jonah upon this, fearing to pass for a false prophet, retired to a hill at fome diffance from the city; where God, by a miracle, condescended to show him the unreasonableness of his difcontent.

JONAS (Jufus), a Proteflant divine, born at North Haufen, in Thuringia, in 1493. He was lone of Luther's moft zealous difciples. He contracted a firitifriendhip with Melanchhon; became principal of the college of Wittenburg, and afterwards dean of the univertity of that city. He wrote a treatife in favour of the marriage of priefts, and oblere works; and died

in 1555.

Jonas (Arnagrinus), a learned Icelander, acquired great reputation by his fell in the feiences, and particularly in affronomy. He was coadjutor to Gundebran de Thorlac, bifnop of Hola, in Iceland. He refused that bifnoprie, after the death of Gundebran; and died in 1649. He wrote feveral works; the principal of which are, Idea were Magifratés, and his history and defeription of Iceland.

JONATHAN, the fon of Saul, celebrated in faored history for his valour, and his friendship for David against the interest of his own house. Slain in

battle 1055 B. C.

Jonatuan Maccabeus, brother of Judas, a renowned general of the Jews. He forced Bacchides the Syzian general, who made war with the Jews, to accept a peace; conquered Demetrius Soter, and afterwards Apollonius, that prince's general; but, being enfnared

by Tryphon, was put to death 144 B. C.

JONES (Inigo), a celebrated English architect, was the fon of a cloth-worker of London, and was born in 1572. He was at first put apprentice to a joiner; but early distinguished himself by his inclination to drawing or designing, and was particularly taken notice of for his skill in landscape-painting. This afterwards recommended him to the favour of William earl of Pembrske, who sent him abroad with a handsome allowance in order to perfect himself in that branch. He was no soner at Rome, than he found himself in his proper sphere: he felt that nature had not formed him to decorate cabinets, but to design paleaces. He dropt the pencil and conceived Whitehall. As the state of Venice he sku when we of Palladio,

and learned how beautiful taste may be exerted on a Jones. less theatre than the capital of an empire. How his abilities distinguished themselves in a spot where they certainly had no opportunity to act, we are not told, though it would not be the least curious part of his history; certain it is, that, on the strength of his reputation at Venice, Christian IV. invited him to Denmark, and appointed him his architect; but on what buildings he was employed in that country, we are yet to learn. James I. found him at Copenhagen, and queen Ann took him in the quality of her architect to Scotland. He ferved prince Henry in the fame capacity, and the place of furveyor general of the works was granted to him in reversion. On the death of that prince, with whom at least all his lamented qualities did not die, Jones travelled once more into Italy, and, affitted by ripeness of judgment, perfected his tafte. To the interval between these voyages Mr Walpole is inclined to assign those buildings of Inigo, which are less pure, and border too much upon the bastard style, which one may call king James's gothic. Inigo's defigns of that period are not gothic, but have a littleness of parts, and a weight of ornaments, with which the revival of the Grecian tafte was encumbered, and which he shook off in his grander designs. The furveyor's place fell, and he returned to England; and, as if architecture was not all he had learned at Rome, with an air of Roman difinterestedness he gave up the profits of his office, which he found extremely in debt; and prevailed upon the comptroller and paymaster to imitate his example, till the whole arrears were cleared.

In 1620, he was employed in a manner very unworthy of his genius: king James fet him upon difcovering, that is, guelling, who were the founders of Stonehenge. His ideas were all Romanized; confequently, his partiality to his favourite people, which ought rather to have prevented him from charging them with that mals of barbarous clumfinefs, made him conclude

it a Roman temple.

In the fame year Jones was appointed one of the commissioners for the repair of St Paul's; but which was not commenced till the year 1633, when Laud, then bishop of London, laid the first stone, and Inigo the fourth. In the reftoration of that cathedral, he made two capital faults. He first renewed the sides with very bad Gothic; and then added a Roman portico, magnificent and beautiful indeed, but which had no affinity with the ancient parts that remained, and made his own Gothic appear ten times heavier. He committed the fame error at Winchester, thrusting a screen in the Roman or Grecian talte into the middle of that cathedral. Jones indeed was by no means fuecessful when he attempted Gothic. The chapel of Lincoln's-Inn has none of the characteristics of that architecture. The cloyster beneath seems oppressed by the weight of the building above.

The authors of the life of Jones place the erecting of the Banqueting-house in the reign of king Charles; but it appears, from the accounts of Nicholas Stone, that it was begun in 1619, and finished in two years—a finall part of the pile deligned for the place of our kings; but so complete in itself, that it stands a model of the most pure and beautish table. Several plates of the inteaded palace at Whitehall have been givens?

I O N

Jones but Mr Walpole thinks, from no finished design. The Arundel, and others, to plant and reduce to uniformifour great sheets are evidently made up from general hints; nor could fuch a fource of invention and of map, or ground-plot, by Inigo Jones, furveyortafte as the mind of Inigo ever produce fo much famenefs. The whole fabric, however, was fo glorious an regard to fo trifling a fingularity, as to be of the exact idea, that one forgets for a moment (fays Mr Walpole), in the regret for its not being executed, the con- been admired in those ages when the Keep at Kenfirmation of our liberties, obtained by a melancholy scene that passed before the windows of that very Banqueting-house.

In 1623 he was employed at Somerfet-house, where a chapel was to be fitted up for the Infanta, the intended bride of the prince. The chapel is still in being. The front to the river, part only of what was defigned, and the water-gate, were erected afterwards on the defigns of Inigo, as was the gate at York-

On the accession of Charles, Jones was continued in his posts under both king and queen. His fee as furveyor was 8 s. 4 d. a day, with an allowance of

not upon record.
